

This is a digital copy of a book that was preserved for generations on library shelves before it was carefully scanned by Google as part of a project to make the world's books discoverable online.

It has survived long enough for the copyright to expire and the book to enter the public domain. A public domain book is one that was never subject to copyright or whose legal copyright term has expired. Whether a book is in the public domain may vary country to country. Public domain books are our gateways to the past, representing a wealth of history, culture and knowledge that's often difficult to discover.

Marks, notations and other marginalia present in the original volume will appear in this file - a reminder of this book's long journey from the publisher to a library and finally to you.

### **Usage guidelines**

Google is proud to partner with libraries to digitize public domain materials and make them widely accessible. Public domain books belong to the public and we are merely their custodians. Nevertheless, this work is expensive, so in order to keep providing this resource, we have taken steps to prevent abuse by commercial parties, including placing technical restrictions on automated querying.

We also ask that you:

- + *Make non-commercial use of the files* We designed Google Book Search for use by individuals, and we request that you use these files for personal, non-commercial purposes.
- + *Refrain from automated querying* Do not send automated queries of any sort to Google's system: If you are conducting research on machine translation, optical character recognition or other areas where access to a large amount of text is helpful, please contact us. We encourage the use of public domain materials for these purposes and may be able to help.
- + *Maintain attribution* The Google "watermark" you see on each file is essential for informing people about this project and helping them find additional materials through Google Book Search. Please do not remove it.
- + *Keep it legal* Whatever your use, remember that you are responsible for ensuring that what you are doing is legal. Do not assume that just because we believe a book is in the public domain for users in the United States, that the work is also in the public domain for users in other countries. Whether a book is still in copyright varies from country to country, and we can't offer guidance on whether any specific use of any specific book is allowed. Please do not assume that a book's appearance in Google Book Search means it can be used in any manner anywhere in the world. Copyright infringement liability can be quite severe.

### **About Google Book Search**

Google's mission is to organize the world's information and to make it universally accessible and useful. Google Book Search helps readers discover the world's books while helping authors and publishers reach new audiences. You can search through the full text of this book on the web at <http://books.google.com/>

# INFORMATION FOR THE PEOPLE.

## PHYSICAL HISTORY OF MAN—ETHNOLOGY.

THE most superficial survey of the earth shows its human inhabitants to be greatly diversified in external qualities—as complexion, stature, the form of the head, and the cast of the features. It also exhibits these diversities as all more or less localised, whence of course the inference is drawn, that they attach to races or nations, with whom they form permanent characteristics. Modern times saw the rise of a science, which, under the name of the *Physical History of Man*, observed these external qualities as zoological facts—facts both in themselves interesting, and of some value as means of determining certain points in the early history of the race. Latterly, the various languages of mankind have been added to the subjects embraced by the science; and as these are not to be comprehended under the term physical, a new name has become necessary, and that of *Ethnology*, as implying simply the science of national distinctions, has been adopted by many. It appears that we are now to look to this science not merely for a view of the natural history of man, and of the sundry questions connected therewith, but for light regarding that obscure but interesting portion of his social history which preceded the use of writing. As yet, however, Ethnology is only in its infancy, and for much which it advances, we are to expect that corrections or modifications will come ere many years are passed.

### PRIMARY DIVISIONS OF MANKIND.

The observations of naturalists have shown that, while it is true that a certain species of animals, remaining under certain conditions, exhibits uniformity of characters from one generation to another, a change of conditions will, in the course of generations, produce a corresponding change in the organic characters of the species, and even in its mental habitudes. Thus, for example, while the wolf is everywhere the same animal, because everywhere passing a wild life in desert places, the dog, distributed over the whole civilised world, and subjected to a great variety of conditions, has passed into numberless varieties of form, colour, and disposition. It appears, however, that these results are only efforts of nature to accommodate herself to circumstances, for the purpose of maintaining the existence of the species under the new conditions, and that there are limits beyond which change cannot be carried; so that, after all, a particular type is constantly preserved, towards which the animals would return if the original conditions were restored. Thus the domesticated pig of Europe, allowed to run wild in America, has recovered the tusks and other external features of the wild boar—that original state of the species from which domes-

tication had brought it. On such grounds it is that naturalists hold the distinction and perseverance of *species* as facts in nature. It has been found, indeed, that species nearly allied, as the horse and ass, will produce an offspring in which the parental qualities are associated or blended; but such hybrids have never been known to continue a race manifesting this union of qualities, and accordingly they in noway affect the conclusion, that specific character is a determinate thing in nature, only liable to temporary modifications.

Under the light thus derived from the study of the lower animals, it is now generally held that we are to regard mankind as of one species—a species passing into an unusual number of varieties in aspect and mental character, only because they are more widely diffused than any other animated beings over the face of the earth, and thereby exposed to an unusual variety of conditions, and called to exercise their mental qualities in an unequalled variety of ways. In the group of human beings commonly called a *nation*, there is always some set of characteristics more or less peculiar, and by which it can be distinguished from all others; though even in this association, especially if civilisation have made any considerable way, we shall find great differences in complexion, form, and mental character. Nations, again, are generally capable of being grouped under some denomination which expresses a more comprehensive set of characters, and marks an affinity of a wider kind. We may go on classifying in this manner, by more and more comprehensive characters, until we arrive at a small number of leading *varieties*, in which nothing remains in common but the general forms and powers of the human organisation. It is difficult, in the present state of the science, to say how many such varieties there are; but it may be convenient to describe the five into which the venerable Blumenbach has divided mankind.

### Caucasian (Indo-European and Syro-Arabian) Race.

The many nations extending from India westward through Southern Asia into Europe and Northern Africa, and which recent times have seen sending out offshoots into the western continent, are comprehensively grouped by Blumenbach and Cuvier under the term Caucasian, because tradition seemed to point to the mountains between the Caspian and the Black Sea as the region where the race had originated. The propriety of the designation is denied by many, and it is now believed that two distinct varieties of mankind are grouped under it. These Dr Prichard describes as the Indo-European or Arian race—comprehending the Hindoos, Persians, Afghans, and Armenians, besides the

great bulk of the European nations—and the Syro-Arabian or Semitic race, comprising the Syrian and Arabian nations. Both groups have the general characteristic of a fair complexion (with exceptions to be afterwards noticed); and this seems to justify their

being considered as one race; but, on the other hand, the languages are now believed to have no sort of true affinity—a test which modern ethnographers regard as more conclusive. It will nevertheless be convenient to speak of all these nations under the old term Caucasian, which has now been too extensively recognised to be readily displaced.

The Syro-Arabian group have been found from the earliest times of which we have any record, in the countries from which their general appellation is taken. (They are also called *Semitic* nations, as supposed to have descended from Shem, one of the sons of Noah.) Distinguished from all the rest of mankind by their language, they also stand out in history as a people of most remarkable characters, and particularly for their exalted notion of an unseen but almighty God, the creator of the world. In this group we find the founders of the great empire which existed for so many ages on the banks of the Tigris and Euphrates; the Phœnicians, who seem to have been the first commercial people of the earth; the Hebrews, whose history is that of the faith recorded in the sacred Scriptures; and the Arabians, among whom sprung up the Mohammedan religion. The Abyssinians probably belong to this race, and the ancient Egyptians are generally classed with it, though Dr Prichard is of opinion that these were in the main an Ethiopian or Negro people. Dr Larrey, the eminent French surgeon, was of opinion that the Arabs furnish the most perfect form of the human head—the most perfect development of all the internal organs, as well as of those which belong to the senses. Spare but active persons, skins of a light brown, sallow sometimes by unusual exposure, high foreheads, large dark eyes, oval features, with aquiline noses and small thin-lipped mouths, form the personal characteristics of the Arabs. They have occupied the confines of the present Arabia from time immemorial, and their natural habits have ever been pastoral and migratory. The Bedouin Arabs claim descent from Ishmael; and however this may be, it is plain, from physical characteristics alone, that they are a cognate race with the Jews. The latter were originally derived from the Chaldeans, an elder branch of the Arab stock settled in Babylonia, and they were a pastoral and wandering people like their neighbours, until they settled in the cities of Palestine. A body of Canaanite Arabs, expelled by the Jews under Joshua, are understood to have settled in Africa, and become the nation of the Mauri or Moors. Governed by Mohammed and his successors, the Arab race rose to high consequence, and, under the name of Saracens, made great conquests of territory in Asia Minor, Africa, and in Spain. They were afterwards deprived of superiority in some of these countries, but left extensive tribes in the African continent and Asia Minor. The Berbers (or *Libyans*) are a race who seem of Arab descent, but who probably settled in Africa at a far distant date. They resemble the Arabs in person, but are more darkened in complexion. Under the name of Tuariks, they range both to the north and south of Mount Atlas. They are wilder in habits than the Arabs, but may be spoken of as the same race, and with the same capabilities.

The Indo-European group is described by Dr Prichard as appearing in the earliest ages on the high grounds between the sources of the Indus and Oxus, whence they went off in two great branches, ultimately

constituting the Hindoos and Persians. The Zend, the ancient language of the Persians, and the Sanscrit, the ancient language of the Hindoos, have an affinity which sufficiently proves the common origin of the two nations. The Indians are a dusky people, the general complexion being described as of a coffee-colour; but while the people of the high grounds are comparatively white, many of those of the plains, and especially the classes engaged in out-door labour, are as dark as Negroes. In general they are a feeble and gentle people; but their having attained to civilised institutions at an early period, and their ancient distinction in the sciences, particularly mathematics, are circumstances which manifest no mean intellectual character.

Ethnographers consider it as established that the principal European nations are colonies from Asia, and descendants of the same people with the Hindoos and Persians. It is solely to a study of the languages that we are indebted for this conclusion. According to Dr Prichard, 'If we are to enumerate the different nations who are to be considered as ramifications of the Indo-European stock, viewing those as the most ancient which are farthest removed from the centre, or from the path of migration, we must begin with the Celtic nations in the west of Europe, including the two branches which are represented in modern times, one by the Irish, Scots, and Manx, and the other by the Welsh and Armoricans, or Bretons. Next to them, in the north of Europe, is the Germanic family. It consists, according to the conclusions of the latest and most accurate philologists, of two principal divisions: of the Northmen, ancestors of the Icelanders, Norwegians, and Swedes and Danes; and secondly, of the proper Teutonic stock in its three subdivisions, which are the Saxon or Western German, the Suevians or High German, and the Gothic or Eastern clan. The next branch of the Indo-European stock are tribes who speak the dialects of the Old Prussian or Pruthenian language. These dialects are the Lettish, Lithuanian, and the Proper Pruthenian, which, of all the languages of Europe, bear by far the nearest resemblance to the original Sanscrit. The people who spoke these dialects had a peculiar mythology, and an ancient and very powerful hierarchy, as famous in the north as were those of the Brahmins and the Druids in the east and west. The Slavic or Sclavonic race is a fourth Indo-European family: its two great branches are the Western or Proper Slavic, including the Poles, Bohemians, Obotrites, and the tribes near the Baltic; secondly, the Eastern branch, comprehending the Russians, the Servians, and other tribes nearly related to them.' Dr Prichard adds, that the Italian nations, excepting only the Tuscans, form collectively another and an early branch of the same stock, all their various languages, the Oscan, Latin, Sicilian, &c. being but variations of one speech. Finally, he enumerates the Albanians, Illyrians, and the more celebrated Hellenic or Greek race. 'It would,' he says, 'be an interesting question, if there were any data likely to facilitate its discussion, whether the Arian [Indo-European] nations found, on their arrival in Europe the different countries already occupied by previous inhabitants, or vacant, and affording them a peaceful and undisturbed admission. The former hypothesis appears most probable, since we know that the most remote parts whither these nations ultimately arrived were previously inhabited. The Euskaldunes appear already to have possessed Spain before the arrival of the Celtic tribes in that country. . . . In the north of Europe the German nations, or rather the Northmen, found the countries on the Baltic coast already occupied by Jotuns, nations of the Finnish or Ugrian race; a people, like themselves, of Eastern origin, but emigrants of an earlier age, and from a different part of Asia.' From the appearance, moreover, of the remains of an earlier language in the Celtic, it may be surmised that the Celts, whose fate it afterwards was to be dispossessed of the greater part of their territory, were originally aggressors upon some still earlier people.

The Germanic family prevails, as has been said, over

a great part of Central and Northern Europe, filling Germany and Scandinavia, and partly also Russia and Poland. The decline of the Roman power brought out the Germanic tribes from their northern settlements, and, under various names, they intruded into the south-west of Europe. They likewise pushed themselves in powerful masses towards the west, and colonised the principal parts of the isle of Britain. From them came the chief elements of the dialects spoken in Holland, Denmark, and England. Robust forms, light hair, blue eyes, florid complexions, and large broad-fronted heads, constitute the chief physical characteristics of the pure Germanic family; while, morally and intellectually, they stand pre-eminently above all the other tribes of mankind. They are conspicuous, in particular, for what may be called the *industrial virtues*, exhibiting a degree of indomitable perseverance in all improving pursuits, which has rendered them the great *inventors* of the human race. The admixture of German and Tartar blood in the north-eastern nations of Europe, has given to these darker hair and complexions than the preceding section, and has also lessened their propensity to intellectual cultivation. The effects of the Tartar conquest of Russia in the twelfth century by Ghenghis Khan, whose successors held the country for 200 years, will probably be observable in the career of this people for ages yet to come.

The *Celtic* family formed extensive settlements at a very early period in Western Europe. The whole, it may be said, of Italy, Spain, France (called *Gallia Celtica*), and Britain, was peopled by them. The successive commingling of races, caused by incursions of the Greeks, Romans, and Germans, did much to obliterate the traces of this variety in its pure state; yet the race, language, and name, still remain in their primitive condition on the outskirts of the original Celtic dominions. These pure Celts show us what the physical characteristics of their ancestors were. Their frames are athletic, spare, and wiry; their foreheads narrow, and the head itself elongated; the nose and mouth large, and the cheek-bones high; in all, their features are rather harsh. In character they are hot and fiery, but generous and brave; and they are remarkably patient of fatigue. Intellectually considered, they are acute and ingenious in the highest degree, but are deficient in that breadth and solidity of understanding which distinguishes the Germanic family.

The present population of France partakes largely of the Celtic blood, notwithstanding various invasions of the Germanic tribes, from one of which, the Franks, came the modern name of the country. From the Celts, the French people derive their proverbial vivacity of temper, their quickness of perception, their dashing bravery, and, most probably, their undeniable inconstancy and flightiness of disposition. Britain, again, has retained comparatively slight traces of her early Celtic inhabitants, though the language is conspicuous in a vast number of the names of places throughout the island. A branch of the Germans had visited England even before the invasion of the Romans; and after the latter came Dane, and Saxon, and Norman, in such numbers, that the pure aboriginal stock were left only in the Highlands of Scotland, and partly in Wales. The Scottish Lowlands had early been colonised by people of Germanic origin; and subsequent intermixtures with the southern inhabitants of the island in time gave the population still more of the Germanic character. In this manner was formed the root of the existing British nation, one of the most remarkable on the face of the earth. Inferior to none of the Caucasian families in intellectual endowments, and possessed of indomitable courage and unbounded enterprise, it has scattered its colonies over a large portion of the globe, giving to new regions its language, its genius, and its arts. Much of the excellence that belongs to the British character certainly arose from the preponderating infusion of Germanic blood. But the sprinkling left of Celtic blood seems to have had its use also, in giving a share of vivacity to the compara-

tively heavy, massive temperament of the pure Germans. We may judge so from looking at the character of the unmixed Germanic families. The Dutch, for example, would evidently have been an improved race had their gravity of character been lightened by a little infusion of Celtic mercurialism. The Belgians have a pretty equal share of Celtic and Germanic blood in their veins; and consequently, while they display the industrial virtues of the latter race, they also show no slight admixture of Celtic vivacity.

There may appear some fancifulness in this mode of analysis, but we believe that an accurate examination of the proportions in which the Germanic and Celtic blood are mingled in all the countries of Europe, would fully bear out the views now taken. In Italy, Spain, and Portugal, infusions of Germanic blood took place, but to a comparatively slight extent. The aboriginal Celts of Spain were extensively mingled with Roman immigrants; and it may be said that at this day Romanised Celts, with a sprinkling of Gothic (Germanic) and Saracenic blood in their veins, form the existing population. In them, the faults of the Roman character, as well as its haughty virtues, are even yet distinctly traceable. Romanised Celts constitute the basis also of the Portuguese and Italian nations, and the preceding remark applies to their character as much as to that of the Spaniards. The languages of the three countries bear out these observations.

It has been remarked that the Semitic nations are distinguished from the rest of this group by their languages. In using language as a means of ascertaining the affinity of nations, philologists attach less consequence to a community of words, though this is not overlooked by them, than to a community of grammatical forms. It is remarked that 'a similar construction prevails through whole classes of languages which have few words in common, though they appear to have originally had more.' The words, it appears, change and perish, but the grammatical structure is permanent. It is also remarked that 'there is a cognate character in words themselves, which sometimes pervades the entire vocabulary of a whole family of languages, the words being formed in the same manner, and according to the same artificial rule.\*' Common words, to be of any service in the inquiry, should be those which refer to the most simple and domestic things, and the most natural and ordinary acts, as those denoting father, mother, brother, the various parts of the body, the most conspicuous objects of external nature, as the heavenly bodies, the domestic animals, &c.; also the first few numerals, and the terms for such acts as eating, drinking, sleeping. Other words, it will readily be apprehended, are more apt to have passed from one people to another, in the course of commerce or other intercourse. Of these, however, it may be said that they are indestructible possessions of all nations. 'Tribes and families separated from each other have been known to have preserved such similar words for thousands of years, in a degree of purity that admitted of an easy recognition of this sign of a common origin.'

Upon these principles, it has been settled that the Sanscrit, the ancient written language of India, besides being in strong affinity to the Zend, or ancient language of Persia, forms as it were the type of all the languages of Europe, thus confirming the fact of all these nations being from one original. Old, however, as the Sanscrit is, it is only the last refined form of a language which had long existed in a ruder state. It is likewise on the same grounds established that the Syro-Arabian family of languages is entirely distinct from the Indo-European; for which reason, those who look most to language as evidence on ethnological subjects, set down the Semitic nations as forming an independent variety of mankind. The Chaldee, Arabic, and Hebrew are the chief languages of this family. The last—which appears to have been also the language

\* Report on Ethnology to the British Association. By James Cowles Prichard, M.D., F.R.S. 1847.

of Phœnicia and of Carthage—is memorable as that which has given a form of writing to Europe, and as that through which mankind have obtained the sacred Scriptures.

Mongolian Race.

The high lands of Central Asia, from the southern skirts of which the Indo-European and Semitic races appear to have descended, are thought to be also the original seat of a great cluster of nations, chiefly nomadic or wandering, which now people Tartary, Mongolia, and Russia in Asia, and of which the Turks are an offshoot. Dr Prichard ranks these peoples together, as exhibiting a tolerable affinity in features and language, under the appellation of Ugro-Tartarian. With

them other inquirers class the vast horde of Chinese and Japanese population, as well as the tribes spread along the shores of the Arctic Ocean, in Asia, in Europe, and America, calling the whole Mongolian, in order to distinguish them as a separate race.

The physical characters of the Mongolians vary considerably, but the following general description will be found to apply extensively. The skin is commonly of a sallow or olive tint, and in some cases nearly yellow; the hair is black, long, and straight, seldom curling; the beard usually scanty; the iris black; the nose is broad and short, and the cheek-bones broad and flat, with salient zygomatic arches; the skull is oblong, but flattened at the sides, so as to give an appearance of squareness; and the forehead is low. In intellectual character, the Mongolians are by no means defective, but they are more distinguished for imitative than inventive genius. This faculty at the same time renders them highly susceptible of cultivation. In many cases, however, tribes of this variety have arrived at considerable proficiency in literature and the arts. Their moral character is decidedly low. The Turkish and Mongol Tartar tribes have been great conquerors in past times, and have often even vanquished the Caucasians; but in most cases their victories have only been temporary. The Fins and Laplanders appear to be a remnant of some primitive Mongolian people, whom the Caucasians originally pushed to the extreme verge of the Arctic seas, and were content to leave there. The Esquimaux, as well as the people of Finland and Lapland, have some physical peculiarities distinguishing them from other Mongolians, but these seem to be the effect chiefly of local position.

Under the test of language, it would appear that the term Mongolian, like that of Caucasian, comprises in reality two varieties or distinct races. The language of the Chinese, and the nations akin to them, is strikingly different in all respects from all others upon earth, 'being constructed of monosyllables which are incapable of inflexion, and do not admit of the use of particles as a supplement to this defect, the position of words and sentences being the principal means of determining their relation to each other, and the meaning intended to be conveyed.' The languages of the other nations comprised under the denomination of Mongolians, possess indeed nouns incapable of inflexion, and in which the variations of number, case, and gender can only be expressed by an additional word—thus far showing a faint affinity to the Chinese; but these languages exhibit other features marking a wide difference, having auxiliaries to composition, such as our particles and prepositions, though always placed after the words whose meanings they affect, and also a peculiar euphonic principle, usually called vocalic harmony, according to which only vowels of certain sets can occur in the same words. On these grounds Dr Prichard sets

apart what he calls the Ugro-Tartarian from the Chinese family of this race.

Ethiopic (African) Race.

The Negro, with his black skin, woolly hair, and peculiar form of countenance, appears as a very distinct type of mankind, and this type is represented generally as occupying Africa, excepting only a certain space bordering on the Mediterranean, where a Caucasian people has intruded. Ethiopia, a distinguished portion of the territory occupied by this type, has supplied a designation for it, which seemed the more appropriate as the ancients recognised the whole of the African continent under this name. The race has also been described under the appellation of *Negro*.

It appears, however, on a narrow examination of the known parts of Africa, that people fully characterised by the popular conception of the Negro features and colour do not occupy a large part of that quarter of the globe. The true Negroes, the people with which the slave system has familiarised us, may be said to be confined to the country of Guinea. Most of the other African nations depart more or less from this character.

Obscure as is our knowledge of Central Africa, it is tolerably certain that a great range of mountains crosses it nearly in the line of the tenth degree of north latitude, and that the central parts of the continent to the south are occupied by a vast table-land, much like that which constitutes the centre of Asia. The range of mountains makes one pretty decided division among the African nations, all to the north being partially civilised, while few traces of civilisation are observable to the south.

The most southern people are the Hottentots, who are described as 'well-proportioned, erect, of delicate and effeminate make, not muscular; their joints and extremities generally small; their face generally ugly, but different in different families, some having the nose remarkably flat, others considerably raised.' It is somewhat remarkable that this population, placed at the extremity of Africa, bear a strong resemblance to the Chinese and Esquimaux, who live at the opposite extremities of the globe. The Bushmen, neighbours of the Hottentots, appear to be the same people in a degraded and more savage state. To the northward, stretching across the whole continent, are the great nomadic nation of the Caffres. According to Professor Lichtenstein, 'the universal characteristics of all the tribes of this great nation consist in an external form and figure varying exceedingly from the other nations of Africa. They are much taller, stronger, and their limbs are much better proportioned; their colour is brown; their hair black and woolly; their countenances have a character peculiar to themselves, . . . the high forehead and prominent nose of the Europeans, the thick lips of the Negroes, and the high cheek-bones of the Hottentots.' The Caffres have great herds, and also cultivate the ground. They have the idea of a supreme being and of a future state.

Similar nomadic nations, more or less approaching the Negro type, and of warlike character, occupy the countries of Congo and Loango on the west, and the region of Mozambique on the east, probably also the intermediate unexplored regions. In the whole of these countries there prevail dialects of cognate languages, excepting the district of the Hottentots.

The great region, now pretty well known to Europeans, situated to the north of the Gulf of Guinea, and extending far into the interior to the eastward, is the grand seat of the Negro type. It is from the Gold Coast, a portion of this territory, that the American

colonies were for ages supplied with slaves. In some districts are found the pure Negroes, an essentially simple and inoffensive people, of whom no description is necessary. Other large tracts are occupied by nations considerably above those in character and in their social state. We allude to the warlike tribes of the Fulahs, the Mandingoes, the Felatahs, and others, among whom a civilisation has been in progress for many centuries in connection with the propagation of the Mohammedan religion. For an example of the characters of these so far advanced nations, M. Golberry describes the Fulahs as 'fine men, robust and courageous. They have a strong mind, and are mysterious and prudent; they understand commerce. Their women are handsome and sprightly. The colour is a kind of reddish black; their countenances are regular, and their hair is longer and not so woolly as that of the common Negroes.' The Mandingo merchants are well known for their activity and intelligence. We can all sympathise in the surprise of Mr Park on finding a city of 30,000 inhabitants (Sego), with many of the usual features of civilisation in this portion of the earth.

It is now understood that, as we traverse the African continent northwards, we pass through nations in whom the Negro type becomes less and less conspicuous, as if it were shading off towards the characters of the Semitic race. 'This gradual change,' says Dr Prichard, 'is not the result of the intermixture of races on the confines of regions of old allotted to either separately. The intermediate tribes are not Mulattoes, or at all resembling Mulattoes: they have each their distinguishing features, which, besides their distinct languages, mark them out as races separate and peculiar, and not less distinct from Negroes than white races themselves. These observations are the results of recent inquiries made on the spot by persons well skilled in natural history and comparative anatomy and physiology, and aware of the important bearing of such inquiries on the physical history of the human species.' Thus in the great known district adjoining to the Red Sea, we pass through the Gallas, Abyssinians, and Nubians, amongst whom we find these transitions more or less marked. The Berberines of Nubia are said by Dr Prichard to represent very clearly the ancient people of Egypt. It appears, on the whole, that there are as great varieties of national appearances in Africa as in any part of the earth of equal extent and diversity of surface, and that the sole ground on which their distinction from the other races can be effectually maintained, is the peculiar character of their languages.

The African race are generally admitted to manifest an inferior intellect to the various tribes of Caucasians. They have never invented an alphabet, and their religious ideas are of a mean character. Yet it fully appears that various portions of this race have made a certain way in the arts of life and in a social polity, while we all know that individuals, introduced among a civilised people, and allowed to partake of education, have manifested very considerable talents. It must also be remembered that there are great appearances as if some offshoot of the Negro race were at least concerned in the origination of that first of all recorded civilisations, that of Egypt.

American Race.

The AMERICAN variety of mankind occupy well-defined territorial limits. They were originally spread over nearly the whole of the Americas, south of the 60th degree of north latitude, though their numbers are now thinned, and their territorial possessions curtailed, by the colonial incursions of the Caucasians. A reddish-brown complexion, long black lank hair, deficient beard, eyes black and deep set, receding brow (sometimes from artificial compression), high cheek-bones, prominent aquiline nose, small skull, with the apex high and the back part flat, large mouth and tumid lips, with fine symmetrical frames of middle

height, form the chief physical characteristics of this race. 'In their mental character,' says Professor Morton, by whom they have been thoroughly studied, 'the Americans are averse to cultivation, and slow in acquiring knowledge; restless, revengeful, fond of war, and wholly destitute of maritime adventure.' The same writer divides the Americans into two great classes, one of which (Toltecans) embraces certain semi-civilised nations—as the Mexicans, Peruvians, and Bogotese; while the other includes all the hunting tribes of North America, the Brazilians, the Patagonians, the Fuegians, and other minor tribes, none of whom have exhibited the same capacities for cultivation as the first-mentioned nations. The Americans differ much in colour of skin and stature. Some of them are not brown, but of a perfect copper tint. The Patagonians are of almost gigantic size, while the Fuegians are very short in stature. Yet there are characters common to all, which have led accurate inquirers to set them down as being throughout one and the same people. Their languages have peculiarities of construction found to be universal among them, from Cape Horn to the far north. By those who, like Cuvier, have not viewed the Americans as an indigenous race, the mode in which the New World was peopled has been curiously inquired into, and it has been conjectured that they either came by Behring's Straits from Asia, or that some small party, in ages long past, was wafted accidentally across the seas to these vast shores. Such an occurrence as the latter has been proved to be not impossible, to say the least of it. But assuredly the weight of evidence is in favour of the opinion that the Americans are not a casual offshoot from some other human family, but a people so far indigenous at least, and primitive, as to be derived from a common root, endowed with specific and unique physical characters. The American race is obviously tending to extinction.

Malay Race.

The MALAY variety of mankind are characterized by tawny or dark-brown skins, coarse black hair, large mouth, short broad noses, seeming as if broken at the root, flat expanded faces, with projecting upper jaws, and salient teeth. The skull in this race is high, and squared or rounded, and the forehead low and broad. The moral character of the Malays, generally speaking, is of an inferior order. They are a race differing much in some respects from the Negro and Red Indian, being of peculiarly active temperaments, and fond of maritime enterprise. They exhibit considerable intellectual capacity, and are an ingenious people. Borneo, Java, Sumatra, the Philippine Islands, New Zealand, part of Madagascar, and various Polynesian islands, are inhabited by this variety of men. It is extremely probable, from the fact of their being found in islands surrounded by others in the hands of the Ethiopic race, that the Malays have pushed out the less active variety from these isles, and, in short, annihilated them. It is but too likely, moreover, that the Malays will in turn suffer extinction at the hands of a superior variety, or a variety rendered superior by civilisation, if not naturally so.

DISTRIBUTION OF THE RACES—AMALGAMATIONS AND EXTINCTIONS.

This point, really one of the most curious and important connected with man's physical history, may be illustrated by further references to the changes in geographical position undergone by the five great varieties of mankind now described from the earliest periods. Very few portions of the earth have retained the inhabitants by whom they are known to have been first peopled. With respect to Europe, it seems extremely probable, as Dr Prichard and others admit, that the Celtic and Germanic races were not the earliest settlers upon its territory. They pushed out, from some parts at least, a previous race, of which the Fins and Laplanders may perhaps be held to give us some idea.

As to this early Celtic migration, it may be worth while to adduce the view of its details which is given by one of the more modern and enlightened ethnographers, Dr Charles Meyer. The Celtic nation is regarded by this writer as, 'owing to its migratory habits and instincts, one of the most widely-spread of all the nations of ancient and modern history, having at various periods covered with its settlements, and perhaps even simultaneously possessed, a space of country extending from the Pillars of Hercules [Gibraltar] to Asia Minor and beyond the Caspian.' 'It seems to me,' says Dr Meyer, 'that the Celtic nation transported itself from Asia, and more particularly from Asiatic Scythia, to Europe and to this country by two principal routes, which it resumed at different epochs, and thus formed two great streams of migration, flowing, as it were, periodically. The one, in a south-western direction, proceeding through Syria and Egypt, and thence along the northern coast of Africa, reached Europe at the Pillars of Hercules; and passing on through Spain to Gaul, here divided itself into three branches, the northern of which terminated in Great Britain and Ireland, the southern in Italy, and the eastern, running along the Alps and the Danube, terminated only near the Black Sea, not far from the point where the whole stream is likely to have originated. The other stream, proceeding in a more direct line, reached Europe at its eastern limit, and passing through European Scythia, and from thence partly through Scandinavia, partly along the Baltic, through Prussia and through Northern Germany, reached this country, and hence to the more western and northern islands across the German Ocean.'

Of these two streams or lines of Celtic migration, which, with reference to this country, we may distinguish by the names of the *western* and *eastern* stream; the former, although the less direct, seems to be the more ancient in history, and to have reached this country several centuries before the other. The principal nations belonging to it are the *Keltai* of Spain (to whom this name particularly refers) and the *Galli*. . . . As the nations and tribes of this western migration are those to which the name of Celts and Gauls more particularly refers, so to them belong most of those characteristics and institutions of the Celtic race—including the important one of Druidism—with which we are made acquainted by the writings of Cæsar and Strabo. The language of the western Celts is in its most distinctive features represented by the British or Gallic branch of the modern Celtic.

Of the nations and tribes of the *eastern migration*, the most celebrated are the so-called Picti and Scoti, who, from the close of the third century of our era, have for a long period held a leading place in the history of this island. . . . The time when the stream of this eastern migration first reached this island seems to have been the sixth century A.C., at which epoch, as we learn from Herodotus (iv. 13), a general commotion took place amongst the different tribes and nations of Asiatic Scythia, similar to that which 400 years later became the primary cause of the great migration of the Teutonic tribes in the fourth and fifth century. This great commotion described by Herodotus, precipitating the eastern on the western tribes, and extending itself

through the Cimmerii, who then inhabited the shores of the Caspian, to European Scythia, finally brought the eastern Celts, in the central parts of Europe, into contact with the western, one of the results of which event was the incursion of the Galli into Italy.\*

It has been seen that this great wave of colonisation, not itself the first, was afterwards followed by another composed of the Germanic tribes. Dr Prichard considers it most probable that this new influx also came in two streams, one proceeding through the regions to the north of the Caspian, and the other across the Hellespont. Of late years, some curious light has been brought to bear upon the early history of these peoples, from the many tombs and tumuli scattered through the north of Asia. In these are found implements and ornamental articles, with which scholars endeavour to associate different sets of people, referred to three different eras. 'The oldest are the relics of a people with round heads, having the transverse diameter of the cranium large in proportion to the longitudinal. The implements and ornaments which are found in the tombs of this race indicate the greatest rudeness. They consist of tools and the heads of arrows and lances made of stone and bone, but nothing indicating a knowledge of the use of metals. Whether these oldest tombs were the sepulchres of a Celtic race, is a question not yet decided. It seems to be the opinion of Retzius and that of Nilsson, who has written a learned work on the antiquities of Scandinavia, that they were the burial-places of a people much older than the Celts. Similar remains more recently discovered in France have been supposed by M.M. Robert and Serres to be referrible in like manner to different eras, but to what successive races they respectively belonged is as yet only matter of conjecture. It seems, however, to have been observed in many parts of Europe, that the skulls which, from their situation, and from the ruder character of the implements and ornaments buried with them, may be supposed to have belonged to the most ancient class, are of a rounder and broader form than the crania discovered in tombs of a later date; and this observation tends to support the notion entertained by many persons, that the west of Europe had inhabitants previously to the arrival of Celtic colonies, and that these earliest people belonged to a family of different physical characters from those of the Indo-European race, and were more nearly allied to the nations of Northern Asia.'

The Celtic population of the south of Europe were in a great measure overwhelmed by the Germanic tide from the north, and though centuries of confusion followed the collision, the good ultimately effected by the intermixture was immense. It appeared, indeed, as if a savage people there crushed a civilised one, but the result, in reality, consisted in the infusion of healthy blood into a vitiated frame. At this day there is but one important part of Europe in the hands of the pure Mongolian race—namely, Turkey. But at this very hour the once formidable power of the Ottomans appears verging to extinction. The Caucasian states around it have gradually seized province after province, and jealousy of each other has alone prevented them, on various recent occasions, from annihilating the petty remnant of the Mongols left in Europe. The power of the empire is not only going to decay, but, as M. Lammartine has lately shown, the Turks are in reality becoming extinct as a people. They are sinking beneath the pressure of the superior or superiorly-cultivated nations around them.

In Africa, the Negroes have already been stripped of a large portion of their continent by the Syro-Arabian and European nations, and are likely to be ultimately extinguished by them. If the climate of the same great country had been more favourable to the whites than it is, they would assuredly have taken a larger share in the occupation of it than they have done. As the case stands, their aggressions have been considerable.

\* Dr Meyer on the Celtic Language, Rep. Brit. Assoc. 1847.

Not to speak of their coast stations, they have colonised the southern extremity of Africa, and the Caffres and Hottentots are falling before them, or are receding to the interior, to be finally crushed between the opposing forces of the Arabs and Europeans.

In Asia, the conquering Mongols long held extensive rule; but the semi-Caucasian power of Russia in the north, and the British in the south, have torn from them immense territories, and every few years behold additional losses on their part. Even at this time, the great Mongol power of China, which, by a policy cautious to an extraordinary degree, maintained for ages its independence, has been obliged to yield an admission to European settlements, which may be regarded as only the first footsteps of an invasion by which their power will be overwhelmed.

The truth of the view now taken is more remarkably borne out by the history of the Transatlantic continent than by that of any other country. Rapidly indeed have the Red Men of North America fallen before the march of Caucasian colonisation. The numerous islands of the Mexican Gulf have been so completely cleared of all traces of native population, that it has become a matter of doubt whether, on several of these islands, any native population ever existed. South America has been largely subjected to the same influences, and would have suffered more from them, had the Caucasians who went thither been a branch specially adapted for the business of colonists, and had not a considerable admixture of races peculiarised that colonisation. As it is, the natives have been thinned, though the amalgamation alluded to, arising from the comparative similarity between the races, renders the truth difficult of discovery. In short, if we look at the whole course of the past history of mankind, we shall find the Caucasian race through some of its families everywhere gaining the ascendancy, and slowly but surely renovating the population of the world.

In those instances where an amalgamation of varieties of men has taken place to a considerable extent (and there are a few prominent cases of the kind to be observed at present on the face of the globe), a people of a heterogeneous kind has been the result. In parts of South America and Mexico, not only Europeans and native Americans, but also Negroes and Malays, transported thither chiefly as slaves, have contributed to form the existing population. Europeans and Negroes produce a race called Mulattoes; the children of Europeans and native Indians are termed Mestizoes; and those of Negroes and Indians are styled Zamboes. Of course the sub-varieties are numerous—indeed almost numberless. The European and the Mulatto produce Tercerons; the children of the Terceron and the European are called Quarterons or Quadroon; and those of Quadroon and Europeans are Quinterons. In the Quadroon, little or no vestige of dark blood is visible; but in most countries where these admixtures take place, the rights of pure white blood are only assigned to the Quinteron. Mexico, and the greater part of the states of the South American continent, including Peru, Chili, and Brazil, with the colonies and islands of the West Indies, are the chief scenes of these amalgamations of blood. Undoubtedly their immediate consequences are pernicious. The white blood is everywhere haughtily disposed towards the dark, and all the jealousies and oppressions of *caste* are accordingly displayed to a dreadful extent. Whether, out of the numerous varieties and sub-varieties of species there at present to be beheld, one perfect and homogeneous race shall ever be formed, is rendered doubtful by the undiminished, if not increased, eagerness with which the purity of the white blood continues to be maintained. If we could suppose that the amalgamations of different varieties of mankind were never to produce happier consequences than in these instances, we might question whether such admixtures be desirable. The experiments of amalgamation and non-amalgamation may be said to have been tried on great scales in the two American conti-

nents, and it is of importance to notice the issue in the respective cases. In North America, we must ere long find the aborigines extinct; and in the place of hordes of savages, stationarily pursuing the wild and warring life led by their fathers from time immemorial, will be found a great and improving race, cultivating the arts of peace, carrying civilisation to the highest pitch, and extracting from their vast continent all the physical blessings with which the Creator has so liberally endowed it, and which He certainly meant not to be unused.

#### DIFFERENCES IN ANATOMICAL STRUCTURE.

##### The Skin.

It has been already seen, that the Caucasians are generally distinguished by a white or fair skin, while the Mongolians are yellow, the Ethiopians black, and the Americans red or copper-coloured:—The black races are localised in the warmest regions of the globe, and their skin and constitution are fitted for their allotment. A black man can lie exposed to the hottest sun, without injury, while the skin of the white man, if exposed to similar heat, breaks out in blisters. The black man can labour under a burning sun with impunity; but the white sinks under exertion made in such circumstances; and this is well known to be the cause why slaves were introduced from Africa into the settlements of Europeans in tropical America. Sir Everard Home, who made some laborious investigations into this subject, was puzzled by the obvious physical fact, that the black skin must absorb more heat than the white. But it has since been suggested by Dr John Davy that the black perspires most readily. 'In the Negro,' he says, 'the blood flows more readily through the vessels, so as to promote perspiration, and by that means contributing to the cooling of the surface, it contributes again, when it flows back to the heart, to the cooling of the internal parts.' After quoting this remark, Dr Glover of Newcastle says—'Were the inhabitant of the tropic not possessed of this organisation, his system could not respond to the stimulus of heat, by a determination of fluid to the surface of the body; and the heat absorbed by the skin being prevented from entering the system by the perspiratory process, the greater radiating power of a dark skin must be beneficial in cooling. Again, the dark skin places the Negro in the conditions of his climate, by causing him to radiate heat at night, and become at that time cooler than a white under the same circumstances.' Hence the love of the Negroes for night dancing and exercise.

In former times, when only two varieties, the white and black, were recognised or thought of, it was supposed that complexion was simply a result of the action of the sun's rays. This idea would naturally arise from its being observed that exposure to the sun darkened a white person, while seclusion tended to bleach or whiten him; and that the black nations were those which chiefly occupied tropical countries, while the whites were placed in the temperate zone. The views of naturalists on this subject were recently disturbed by the investigations of M. Flourens concerning the actual structure of the coloured skin.\* The white was represented as having a skin composed of three integuments. First, the outer or *scarf-skin*, a thin transparent pellicle, seemingly secreted by the parts below, and devoid of recognisable vessels or nerves; next below the *rete mucosum*, a soft pulpy net-work; next, or underneath, the *cutis* or true skin, a strong layer, abundantly vascular, and very sensible. It was supposed that the colouring matter of the dark races lay in the *rete mucosum*, and that the only difference between the two races in that respect lay in the one having a mucous integument charged with globules of colouring matter, and the other a mucous integument in which there were no such globules. Flourens asserted the difference to be considerably greater. He

\* On the Natural History of Man. By M. Flourens. Edinburgh New Philosophical Journal, July 1839.

states that, in a sufficient variety of experiments upon the skins of Negroes and red Americans, he has found beneath the *rete mucosum* two distinct additional layers, capable of being detached, and the outer of which is the true seat of the colour of those races. The discoverer considers this as a difference much more important than any depending on form. Being a structural difference, he thinks it should be held as one of the first class, while differences of shape ought only to be considered as secondary. Without following him in these speculations, we may readily allow the importance of a peculiarity which consists in a distinct and additional part. M. Flourens, it may be remarked, has found the two layers also in Mulattoes. He had not had an opportunity of experimenting upon Mongolians or Malayans; but he infers from the other cases that in them also the extra integuments would be found.

M. Flourens adds, that in the case of Europeans tinged by exposure to the sun's rays, the mucous web is what is affected, becoming, as it were, slightly dyed. No degree of exposure can, he thinks, confer the colouring layers of the Negro and other dark races. He remarks, that the African Moors, who have lived beside the Negroes for centuries, have never acquired the colouring apparatus of that race; and it has been observed by travellers (Captain Lyon among others) that the Tuarika, a race of African Caucasians, of a dark-brown complexion, are nearly as white on those parts of their bodies covered up from the sun, as most Europeans. It is also well known that the progeny of a European, however much he may have been tinged by the sun of a tropical climate, is invariably as white as he himself was at first.

M. Flourens deems the difference of structure between the white and coloured races as sufficient to prove that they are of different stocks, and he accordingly speaks of them as 'essentially distinct races.' But there are some considerations which greatly confound all such conclusions, as drawn from differences of colour alone. Colours, it is to be observed, are not invariable characteristics of particular races. Most Caucasians, it is true, are white; but then there are also black Caucasians. The Hindoos are undoubted Caucasians, being proved to be so by many characters of form, as well as by the infallible test of language; yet the Bengalees and Malabars, varieties of the Hindoos, are often as black as the generality of Negroes. Caucasians of similar colour are spread through Persia and Western Asia, into Northern Africa. It has indeed been said that the Hindoo branch of the Caucasians alone includes every variety of colour, from the deepest black to something very nearly white. There are similar variations in at least one of the other four races. 'Although the Americans,' says Dr Morton, 'possess a pervading and characteristic complexion [which he describes as more brown or cinnamon-coloured than red], there are occasional and very remarkable deviations, including all the tints from a *decided white to an unequivocally black skin.*' The white tribes have been found chiefly in the high regions in the northern part of South America. These facts are themselves sufficient to show that the colour cannot be, as represented by M. Flourens, an essential or specific distinction; and their purport is confirmed by some more recent investigations, which result in showing the so-called *rete mucosum* as nothing but an inner layer of the epidermis, liable to continual renewal as the outer is worn away, just like the bark of the tree. The hue of the Negro is now believed to depend on the presence of colouring matter in the cells of the epidermis itself, and to be a variable phenomenon, exactly like the appearance of freckles under the influence of sunlight.

#### Hair and Eyes.

The hair is a strong individual characteristic in man. Its colouring principle is evidently the same, speaking comprehensively, with that of the skin. The hairs issue from bulbs or roots beneath the true skin, where

vessels supply them with nourishment. An external horny covering, and an internal pith, constitute the body of each hair, and the pith is to some extent vascular, because liable to disease. It is doubtless in this vascular pith that the colouring principle lies. The fact of the pith being supplied both with vessels and nerves, is further proved by the effect which great grief can produce upon the colour of the hair. Dr Prichard had personally observed one case in which the hair grew white in a single night through grief, and many similar cases are on record. One distinguished French anatomist went so far as to assert, that in the bulbs of the hair lay the whole colouring matter of the skin; but admitting that minute hairs exist on the general frame, we could not thus explain the black hue of the inside of the Negro's lip, which is free from hair. However, when we consider that the woolly hair is usually connected with the jetty skin of the Negro, and the lank straight hair with the red skin of the Indian, we must believe in the existence of some strong bond between these physical characteristics.

In like manner do we trace a general correspondence between the colour of the eye and the skin and hair. The hue of the eye depends on a pigment or dye, lining the choroid coat or membrane. According to the tint of this pigment, is the eye blue, gray, brown, hazel, or black. Generally speaking, light-coloured eyes are conjoined with fair complexion and light hair, and the converse holds as commonly good. To this rule, it is well known, there are exceptions; yet Mongols, Ethiopians, Malays, and Americans, in ninety-nine cases in the hundred, show the extent of its applicability. The Caucasians display in this respect greater variations.

Albinos are individuals whose peculiarities depend on *defects*. Red eyes and white hair are their chief features, though these features vary a little according to the race to which the individual belongs; and there are Albinos to be found in almost all countries. The redness of the eye depends on the absence of pigment on the choroid coat, permitting the red blood-vessels to be seen. From a deficiency in the power of absorbing the rays of light, which purpose is served by the pigment, the eyes of Albinos are weak. The Albinos of the black race are called white Negroes, from the colour of their skin, and they have white woolly hair. Among the copper-coloured natives of the Darien isthmus, Albinos are common. Their bodies are of a milk-white tint, covered with a short down; and they have white hair, with red eyes. They love such light as the moon gives, and by night are all life and activity, while by day they are miserable, the rays of the sun making their weak eyes stream with water. The connection between skin, hair, and eyes, and the unity of the source of colour for all these parts, is very strikingly exemplified by the peculiarities of the Albino.

#### Skulls and Heads.

As, beyond all doubt, we ought to consider the form of the skull as in some degree indicative of the intellectual powers, the distinctions in this organ necessarily become of great importance. The most perfect type of the Caucasian skull was alleged by Blumenbach to be found in the modern Caucasians-proper, such as the Georgians. 'The head [of a female Georgian, described by the philosopher] is of the most symmetrical shape, almost round; the forehead of moderate extent; the cheek-bones rather narrow, without any projection, but having a direction downwards, from the malar process of the frontal bone; the alveolar edge well rounded; the front teeth of each jaw placed perpendicularly.'

The head of the perfect Mongolian type is described by Blumenbach as 'almost square; the cheek-bones projecting outwards; the nose flat; the nasal bones, and the space between the eyebrows, nearly on the same horizontal plane with the cheek-bones; the superciliary arches scarcely to be perceived; the nostrils narrow; the maxillary pit slightly marked; the alveolar edge in some degree rounded forwards; the chin slightly prominent.'

PHYSICAL HISTORY OF MAN—ETHNOLOGY.

In the Ethiopic variety of men, 'the head is narrow, and compressed at the sides; the forehead very convex, vaulted; the cheek-bones projecting forwards; the nostrils wide; the maxillary pits deeply marked at points; the jaws considerably elongated; the alveolar edge narrow, long, and elliptical; the front teeth of the upper jaw turned obliquely forwards; the lower jaw strong and large.'

In the American skull there is an approach in shape to that of the Mongol, with this difference, that the top is more rounded, and the sides less angular. The summit of the Malay head is narrowed, the forehead a little arched, and the upper jaw pushed somewhat forward. It would be superfluous to enumerate here the particular tribes marked by these varieties of skulls, as this has been done with sufficient distinctness in the general classification of the races. Of course, among Caucasians, Mongols, and Negroes, there are considerable individual differences in the form of the head, but the preceding descriptions give the type of each division.

The remarkable contrast in the promineny of the facial bones, conjoined, as it commonly is, with an equally striking difference in the anterior development of the skull, has been deemed by some physiologists a feature of the highest importance. Camper founded on these physical characters a scheme for estimating the degrees of intellect and sagacity bestowed by nature on the whole members of the animal kingdom possessing a skull and brain. The *facial angle*, as he termed the degree of promineny in the facial bones, was measured by him in the following way:—One straight line was drawn from the ear to the base of the nose, and another from the prominent centre of the forehead to the most advancing part of the upper jaw-bone, the head being viewed in profile. 'In the angle produced by these two lines,' says the physiologist, 'may be said to consist not only the distinction between the skulls of the several species of animals, but also those which are found to exist between different nations; and it might be concluded that nature has availed herself at the same time of this angle to mark out the diversities of the animal kingdom, and to establish a sort of scale from the inferior tribes up to the most beautiful forms which are found in the human species. Thus it will be found that the heads of birds display the smallest angle, and that it always becomes of greater extent in proportion as the animal approaches most nearly to the human figure. Thus there is one species of the ape tribe in which the head has a facial angle of forty-two degrees; in another animal of the same family, which is one of those *simiæ* approaching most closely to the human figure, the facial angle contains exactly fifty degrees. Next to this is the head of the African Negro, which, as well as that of the Kalmuc, forms an angle of seventy degrees, while the angle discovered in the heads of Europeans contains eighty degrees. On this difference of ten degrees in the facial angle the superior beauty of the European depends; while that high character of sublime beauty, which is so striking in some works of ancient statuary, as in the head of the Apollo, and in the Medusa of Tisocles, is given by an angle which amounts to one hundred degrees.'

Dr Prichard, in quoting this passage, remarks, that 'the faculties of each race of animals seem to be perfect in relation to the sphere of existence for which they are destined;' and hence, in as far as the measurement of the facial angle is applied to the determination of the comparative intellectual characters of different tribes of the lower animals, he holds Camper's scheme to be imperfect and ineffective. As a method of distinguishing varieties in the shape of the actual cerebral case, moreover, the measurement of the facial angle is not always a safe guide. 'I have now before me,' says Blumenbach, 'the skulls of a Lithuanian Pole and a Negro, in which the facial angles are nearly equal, but the difference between the shape of the two crania is otherwise prodigious.' Nevertheless, as a general test of the mental capacity of individuals, 'I think,' says Prichard, 'we must allow that experience

is in favour of the position assumed by Camper. It is certain that every man is struck with the expression of dignity or elevation of mind and character in the ancient busts, which have a great facial angle, and that this expression would be lost if the facial angle were contracted. The fact seems indeed to be a general one, that men of great intellect have fully-developed brains, as indicated by elevated and capacious foreheads.' Since the time of Camper, it is scarcely necessary to tell the reader, the subject of craniology has been amply investigated by Dr Gall and his followers, who have founded upon their inquiries a system of mental philosophy (Phrenology), in a great measure new to the world, and of which the fundamental principle is, that the size and form of the skull, as depending on the size and form of the brain within, denote, other circumstances being equal, the intellectual and moral character.

Having obtained a considerable number of the skulls of the various races of men, Dr Morton measured their internal capacity by means of white pepper seed, and found the following results:—

RACES.	No. of skulls.	Mean internal capacity in cubic inches.	Largest in the series.	Smallest in the series.
1. Caucasian, - -	52	87	109	75
2. Mongolian, - -	10	83	93	69
3. Malay, - - -	18	81	89	64
4. Aboriginal American, - -	147	80	100	60
5. Ethiopian, - -	29	78	94	65

It thus appears that the aboriginal Americans rank fourth with respect to the size of their brains, the Ethiopians being lowest and the Caucasians highest.

This result is certainly the precise one to be expected, considering the capacity of the cranium as an index of intellectual power. The Caucasian race, which stands highest in the scale, is that which has produced the most civilised nations; while the Mongolian, the next in order of capacity of cranium, has produced a number of nations which remain at a fixed point in semi-civilisation. The Malay is a degree more barbarous, and the American and Ethiopian the most barbarous of all.

The physical characteristic now under consideration varies considerably among the white nations or Europeans. The Turks, who, though originally a Mongol race, have had their primitive physical attributes modified by continual intermixtures with Greeks, Georgians, and Circassians, present a form of skull combining, apparently, the mingled characters of the two varieties. The square Mongolian head has been rounded off in their case, and we find it to be now almost a perfect globe. The Greek head approaches the same shape. It was long asserted that the globularity of the Turkish head resulted from artificial compression in infancy, but modern physiologists discredit this notion. 'A single glance at the Turkish head,' says Mr Lawrence, 'at the symmetrical and elegant formation of the whole fabric, the nice correspondence and adjustment of all parts, the perfect harmony between the cranium and face, in all the details of each, demonstrate most unequivocally that it is a natural formation, and a very fine work of nature, too.' The writer now quoted proceeds also to remark, that, although no sufficiently extensive examinations have yet been made, the probability is, that between the European nations, such as the Germans, Swiss, Swedes, French, and others, distinct differences in the shape of the skull would certainly be found to exist on inquiry. Mr George Lewis observed in travelling on the continent, that the French have the lower and anterior parts of the cranium large, while the upper and anterior region is more prominent in the Germans. The Italian head, though comparatively small for the most part, is marked by great elegance. The Jews have long been noted for the fine Caucasian shape of their heads.

Dr Prichard avows the opinion that the form of the head is less a feature of races, than an indication of stages in civilisation. He intimates, but in a very general way, and without pretending to make the observation as one which holds without many exceptions, 'that there are in mankind three principal varieties in the form of the head and other physical characters, which are most prevalent respectively in the savage or hunting tribes, in the nomadic or wandering pastoral races, and in the civilised and intellectually-cultivated divisions of the human family. Among the rudest tribes of men, hunters and savage inhabitants of forests, dependent for their supply of food on the accidental produce of the soil or the chase, among whom are the most degraded of the African nations and the Australian savages, a form of the head is prevalent which is most aptly distinguished by the term prognathous, indicating a prolongation or extension forward of the jaws. . . . A second shape of the head, very different from the last-mentioned, belongs principally to the nomadic races, who wander with their flocks and herds over vast plains, and to the tribes who creep along the shores of the icy sea, and live partly by fishing, and partly on the flesh of their reindeers. These nations have broad and lozenge-formed faces, and what I have termed pyramidal skulls. . . . The most civilised races, those who live by agriculture and the arts of cultivated life, all the most intellectually-improved nations of Europe and Asia, have a shape of the head which differs from both the forms above-mentioned. The characteristic form of the skull among these nations may be termed oval or elliptical. . . . There are numerous instances of transition from one of these shapes of the head to another, and these alterations have taken place in nations who have changed their manner of life.'

It should not be omitted that many of the tribes of North and South America are so partial to low and retreating foreheads, that they have long been in the habit of assisting nature in producing that form of the head. The comparative softness of the osseous texture at birth, and the partially mobile state of the cranial sutures, enable them to effect this object. 'The Caribbs,' says Labat, in his account of a voyage to the isles of the Caribbean Sea, 'are all well made and proportioned; their features are sufficiently agreeable, excepting the forehead, which appears rather extraordinary, being very flat, and, as it were, depressed. These people are not born so, but they force the head to assume that form, by placing on the forehead of the newly-born child a small plate, which they tie firmly behind. This remains until the bones have acquired their consistence; so that the forehead is flattened to that degree that they can see almost perpendicularly above them without elevating the head.' The consequence is, that the heads of these people, naturally somewhat depressed in front, become hideously so; and unnatural bulges behind show that the cerebral matter has been forced into new positions. The possibility of changing the form of the skull has been doubted by some physiologists, but the circumstance is authenticated beyond all question. In Morton's *Crania Americana* are delineated many specimens of skulls thus altered in form, some so greatly changed by a pressure which has been applied both before and behind, as to resemble half-moons. It is not necessarily to be inferred that injury results either to the mental constitution or the general health of those who submit to this process. Supposing the pressure to be slow and gentle, the ductile organs will easily accommodate themselves to it, and it is probable that the brain, as far as its size or volume is concerned, will remain unaffected. A skull in Dr Leach's possession, bearing the marks of extraordinary compression, is known to have been that of a Caribb chief distinguished for intelligence and prudence.

The Teeth.

The general differences of features, accompanying these variations in the shape of the skull, were pointed

out in going over the great divisions of the human race. The teeth of mankind differ very little in shape or position. 'The oblique position,' says Mr Lawrence, 'of the anterior incisors in the Negroes, and some other tribes who have prominent jaws, is the only national difference I know of in teeth. Their size and form exhibit merely individual differences.' The peculiarity here alluded to appears very distinctly to be only an effect of certain conditions, as it is found amongst our own population, where the diet is low and defective, and the general condition is unfavourable to the full development of the human being.

PHYSICAL CHARACTER.

The differences which exist among the races of mankind, with respect to Figure, Proportions, and Strength, form a branch of the present subject not less interesting than any yet noticed. It has long been attempted, in the civilised regions of the world, to ascertain and fix a standard of physical perfection for the human body; and there certainly does seem to be a model, the closest approach to which combines the quality of pleasing the eye with the possession of the greatest degree of corporeal power and activity. Artists have usually looked to the model-figures of the Caucasians of Greece, or, in other words, to their ancient statues, as exemplifying the finest possible proportions of the human frame. But the taste of man varies so much, and habit modifies to such an extent his physical powers, that any standard of the kind alluded to must be open to numberless objections and exceptions. If judged of by the common artistical standard of the civilised world, certain races of men would be set down as out of proportion, and yet they possess physical powers of the most perfect kind. The Hottentot and the American savage will outrun wild animals, and hunt down the deer; the slim and 'effeminate Hindoo,' as we call him, will keep up with the horse for days; and the South Sea islander feels himself at home in a raging surf, which would whelm a boat or vessel. Yet these races depart widely in many cases from the Grecian model. Such facts show that physical power is at least not confined to men moulded after the Grecian artistical standard, though it may be that individuals so moulded would surpass in the exercises mentioned, with equal training, those otherwise fashioned.

Stature and Proportions.

Different races of men exhibit considerable diversities of stature, though there are no varieties of stature in different nations so remarkable as those which frequently occur in the same family. The tallest race of men, authentically known to exist, are the Patagonians, a tribe occupying the coast of South America, between the Rio de La Plata and the Straits of Magellan. The territory occupied by them is of immense extent, and they are probably migratory in habits; hence a considerable degree of discrepancy in the accounts given of them by different writers. Magellan's companions declared the Patagonians to be commonly about seven feet four inches in height, English measure. Commodore Byron saw and conversed with many companies of them, and states that few were under seven feet, while others were considerably above it. Nearly six feet high himself, he could barely touch the top of a chief's head, though standing on tip-toe. Captain Wallis, again, having probably examined a different tribe, says that the majority of the Patagonians seen by him averaged from five feet ten to six feet, and that he only saw one man so tall as six feet seven. By later and accurate measurements, made by the Spaniards, we learn positively, that there are at least Patagonian tribes reaching the average height of from six and a-half to seven feet. Were they even somewhat less, they would be decidedly the tallest race of men existing on the face of the earth. All voyagers admit them to be large and muscular in proportion to their height.

A people situated in the polar circles of the north, stand nearly at the other extreme of the scale as re-

## PHYSICAL HISTORY OF MAN—ETHNOLOGY.

spects stature. The Esquimaux, or at least some tribes of them, are for the most part between four and five feet in height, and their congeners the Laps are also a dwarfish race. The Ehiopic variety also numbers some very small tribes, and in particular the Bojesmans, a race said to be also very commonly deformed. Among the American nations there are also dwarfish tribes, and in particular the natives of Terra del Fuego, near neighbours of the Patagonians.

These nations only present us with the extremes of the human race, as respects stature. The subject is worthy of more minute investigation. It would be highly interesting, and indeed instructive, to know the comparative average stature of each of the ordinary varieties and sub-varieties of mankind. Unfortunately, the observations of naturalists respecting stature have not been carried far. Quetelet and others have attentively examined the relative heights of individuals of single nations, at different ages, with a view to determine the general phenomena of man's growth; but few observations have been made upon the respective heights of different races or nations. The stature of the Caucasian has not been fully compared with that of the Mongol, or the Negro, or the Red Indian; nor have single nations belonging to any of these great varieties been satisfactorily contrasted with one another, as respects height. No accurate comparisons, for example, have yet been made of German with Spaniard, of Briton with Frenchman, or, in fact, of any one European nation with another. The following table, exhibiting the comparative heights of a small number of Englishmen and Negroes, is given in the work of Mr Lawrence upon the 'Natural History of Man.' The Negroes were from various regions.]

	Stature. Feet. In.		Stature. Feet. In.
An Englishman,	5 4½	A Negro,	5 10½
Ditto,	6 1	Ditto,	5 5½
Ditto,	6 0	Ditto,	5 8
Ditto,	5 9½	Ditto,	5 0
Ditto,	5 7	Ditto,	5 7½
Ditto,	5 4½		
Ditto,	5 0		

The Caucasian here has considerably the advantage of the Negro, the average height of the former class being nearly 5 feet 9 inches, while the black averages little above 5 feet 6 inches; and the advantage would still be on the same side, were we to leave the first Englishman, certainly a man of uncommon height, entirely out of the reckoning. But it must be admitted, that from such an insignificant amount of examples no satisfactory conclusions can be drawn. The accounts of recent travellers in Africa would lead one to imagine that the majority of the Negro nations, excepting in the case of a few particular tribes, such as the Bojesmans, are not below the Europeans in average height. The Caucasians have indeed the advantage in one respect; no tribe or section of them sinks so low in the scale of altitude as some of the other races do.

The stature of the Chinese, who must be regarded as amongst the purest specimens of the Mongol variety, was accurately and extensively measured by Mr Rollin, the surgeon who accompanied La Perouse. He found the ordinary height of the natives of the great Isle of Tchoka, on the east coast of China, to be *five French feet*.\* The natives of the mainland, near the same region, measured 4 feet 10 inches (French). This examination places the pure Chinese below the average height of Europeans, and, we believe, correctly. Other Mongol races have not been accurately examined, with a view to the point under consideration. In that variety of mankind, however, as in the Ehiopic division, there are individual races which stand much lower in the scale of height than any Caucasian tribe. The Esquimaux and Fins prove this assertion.

The Americans also present great differences in height; so much so, that it would be vain to attempt

\* The French foot slightly exceeds that of England, the proportions of the former to the latter being as 1.006 to 1.000.

to discover or strike an average for the whole variety—a variety which comprises the giant Patagonians and the dwarfs of Terra del Fuego. For determining the heights of individual tribes of Americans, we have at present no better authority than the loose reports of travellers. The same may be said of the Malays; and, such being the case, it would be a waste of time to attempt any comparative estimate having reference to these races. One conclusion may be drawn from the little which we do know, and that is, that civilisation equalises the stature of mankind, and keeps it near a steady mean. All the less cultivated races present extremes not to be observed among the Caucasians.

Professor Forbes of Edinburgh has made a series of experiments upon the physical differences between English, Scotch, Irish, and Belgians, the results of which constitute the most interesting information we are able to lay before the reader, with respect to the comparative heights of sub-varieties of the Caucasians. The following is a table drawn up by Professor Forbes, to exhibit the relative heights, at different ages, of the students attending his class during a series of years, and belonging respectively to England, Scotland, and Ireland. The Belgian measurements were probably derived from other sources. The number of individuals subjected to examination was very considerable, so many as eighty Scotch and thirty English being occasionally measured at once.

*Heights—Full dimensions with shoes.\**

Age.	English.	Scotch.	Irish.	Belgians.
	Inches.	Inches.	Inches.	Inches.
15	64.4	64.7	...	61.8
16	66.5	66.8	...	64.2
17	67.5	67.9	...	66.1
18	68.1	68.3	68.7	67.3
19	68.5	68.9	69.4	67.7
20	68.7	69.1	69.6	67.9
21	68.8	69.2	70.0	68.0
22	68.9	69.2	70.1	68.1
23	68.9	69.3	70.2	68.2
24	68.9	69.3	70.2	68.2
25	68.9	69.3	70.2	68.3

This table places the Irishman uppermost in the scale of stature, the Scotsman second, the Englishman next, and the Belgian lowest. The comparison seems to be fair as regards the parties taken, for, if there were any peculiarity in their condition as students, it must have been common to all. As a comparison of national heights, therefore, the table perhaps exhibits conclusions pretty generally applicable, and we shall find it borne out by similar comparisons of *weight* and *strength*. Professor Forbes's observations are confirmed, in one point at least, by the following passage in Quetelet's work upon Man:—'When in England, we chose the terms of comparison from rather higher classes of society [he has been speaking of English factory *children*]: we find the stature of man rather *higher* than in France or the Low Countries, at least for young persons between eighteen and twenty-three years of age.' Quetelet then alludes to eighty different measurements of Cambridge students, taken in groups of ten each. The average height of every ten was 58 feet, or 5 feet 9 inches and 3-5ths to each man. This is above Professor Forbes's average; but as the English universities are chiefly attended by the aristocracy, who are undeniably a section of the people above the average national stature, it is probable that, as a national comparison, Professor Forbes's table approaches nearest to the truth.

The table alluded to indicates the cessation of growth to take place at twenty-two, the case of the Belgians being the only exception. We learn from another of the valuable inferences made by Quetelet from his investigations, that the stature is materially influenced by residence in town or country. 'The stature of the

\* Half an inch may be reckoned as equivalent to the shoe.

## CHAMBERS'S INFORMATION FOR THE PEOPLE.

inhabitants of towns, at the age of nineteen, is greater than that of the country resident by 2 or 3 centimetres.' An examination, accompanied with vast labour, of not less than 3500 individuals living in towns, and 6000 residing in the country, brought Quetelet to this conclusion, which is therefore in all probability correct, and will be found to hold good in all situations. It was only at the age of nineteen, however, that the stature of the townsman was found by Quetelet to exceed that of the rustic; and he conceives it possible, though it was not in his power to obtain full proof on the subject, that 'the inhabitant of the country may attain to a greater height than the inhabitant of the town before the completion of the full growth.' The truth is, that circumstances greatly modify the rate at which the growth is developed. The law of nature on the subject is thus stated by Quetelet:—'The growth of the human being, from several months before birth up till the period of complete development, follows such a law of continuity, that the accessions of growth diminish regularly in amount, in proportion to the age.' Here, of course, each successive addition of growth is considered relatively to the growth previously acquired. 'We shall find,' he says, 'that the child increases in size 2.5ths from birth to the end of the first year; 1.7th during the second year; 1.11th during the third year; 1.14th during the fourth year; 1.15th during the fifth year; 1.18th during the sixth year, and so on; the relative growth always decreasing from the time of birth.' This simple law of nature, however, is liable to be greatly affected in its operation by circumstances. 'Dr Villermé remarks,' says Quetelet, 'that the height of man becomes greater, and the growth takes place more rapidly, other circumstances being equal, in proportion as the country inhabited is richer, the comfort more general, houses, clothes, and nourishment better, and labour, fatigue, and privations less during infancy and youth; or, in other words, the circumstances accompanying misery put off the period of the complete development of the body, and stint human stature.' There can be no doubt of the accuracy of these remarks. The simple exposure to the action of cold, not to speak of toil, materially influences the growth of man; and we see this proved, conversely as well as otherwise, in all the extreme climates of the world. The warmth and luxury of cities develop rapidly the growth of all but the lowest classes. Our British gentry bear out fully the conclusion of Quetelet, that 'individuals who enjoy affluence generally exceed the mean height: hard labour appears to be an obstacle to growth.'

### Weight of the Human Body.

The stature, weight, and strength of the human body, form but parts of one and the same subject. Each of these properties or characteristics, if not dependent on, is at least closely related to, both the others. As the object here is to make the view of the species comprehensive rather than minute, it were to be wished that the *weight* of the body, among the various races of men, had been inquired into with some attention by naturalists. But, as in the case of the stature, this has yet been done only to a very imperfect extent. Quetelet has fully examined the comparative weight of the human body at different ages, and of differently placed individuals in a single nation; but no attempts have been made to determine the comparative weights of Mongol and Caucasian, or American and Negro. The endeavour to do so would be attended undeniably with vast trouble, and some may think the matter not worthy of it. This, however, is not a correct view of things. In all undertakings that require the exertion of physical energy, and more particularly in war, bodily weight, it has now been clearly shown, is a most important element; and, wherever the superiority in this respect lies, thither will success, other circumstances being equal, almost infallibly tend. An observation of the various collisions of troops on the field of Waterloo, whether of horse or foot, has been found to substantiate this proposition.

Professor Forbes extended his inquiries among his students, English, Scotch, and Irish, to bodily weight, adding examinations of similar, and also of mixed classes of Belgians. The results were as follow:—

### Weight in Pounds, including Clothes.

Age.	English.	Scotch.	Irish.	Belgians (not mixed classes).
	lbs.	lbs.	lbs.	lbs.
15	114.5	112	...	108
16	127	125.5	129	117.5
17	133.5	133.5	136	127
18	138	139	141.5	136
19	141	143	145.5	139.5
20	144	146.5	148	143
21	146	148.5	151	145.5
22	147.5	150	153	147
23	149	151	154	149.5
24	150	152	155	149.5
25	151	152.5	155	150

Here, again, the superiority lies with the Irish, the others holding the same relative positions as in the case of stature. The mixed classes of Belgians, in whose case the weight of clothes was deducted, ranked exceedingly low—134 lbs. being about the average. We have it in our power, fortunately, to compare the conclusions of Professor Forbes with those of other inquirers, in as far as the English and Belgians are concerned. The eighty students of Cambridge, weighed (with the clothes) in groups of ten, gave an average, as we are informed by Quetelet, of 151 lbs.—the precise mean, it will be observed, of the Englishmen of twenty-five years of age weighed by Professor Forbes. The Cambridge students, however, were between eighteen and twenty-three years old, and therefore the Cambridge estimate is a little higher than that of Professor Forbes, as it also was in the case of stature. With respect to the weight of the Belgians, as examined by Quetelet, he states that the mean weight of the Cambridge students of eighteen and twenty-three much exceeds that of Belgians of the same age, being nearly the same as that of men of *thirty* in Brabant and the other departments of Flanders.

The superiority of the Irish in point of stature and weight is remarkable. We shall find it borne out by a corresponding superiority in physical power, as shown in the table of Professor Forbes having reference to that characteristic.

Quetelet's conclusions respecting the weight of the human being at various ages, and the general laws regulating his growth in this particular, are nearly as follows:—The mean weight of male children at birth is 3.20 kilogrammes.\* The weight of female infants is less, being 2.91 k. A child loses weight for the first three days after birth, and does not make any decided increase until about the seventh day. Ages being equal, man generally weighs more than woman; but at the age of twelve this is not the case. The sexes are then nearly equal in this respect. The period of complete development in man, as respects weight, is the age of forty; woman, again, does not attain her maximum till the age of fifty. According to observations made on the most extensive scale in Belgium, the mean weight of man at twenty-five is 62.93 k.; at the age of forty (the maximum period), it is 63.7 k. The mean weight of woman at twenty-five is 53.2 k.; at fifty (the maximum period), it is 56.16 k.† The maximum weight of the human being is nearly twenty times the sum of his weight at birth. The mean weight of the human being, neither sex nor age being taken into account, is 45.7 k. From the ages of forty and fifty, men and women begin respectively to sustain a decrease of weight, from six to seven kilogrammes being the usual loss before the close of life.

\* A kilogramme is as nearly as possible 2 1-5th lbs. English.

† The mean weight, therefore, of man in Belgium, at the maximum period, is little more than 140 lbs. English. This is much below the average of man in Britain.

## PHYSICAL HISTORY OF MAN—ETHNOLOGY.

### Strength of Men.

The strength of the human frame is a subject which has received much more attention than has been paid either to its weight or proportions. It is obviously, indeed, a subject of the utmost moment, whether we view it with reference to the comparative physical powers of different races, or simply as a question interesting to civilised man from its bearing on practical mechanics. Various methods have been proposed for determining accurately the strength resident in the loins and arms of the human frame; and the instrument called the *dynamometer*, invented by Regnier, is that most generally approved of and employed for the purpose. The dynamometer, however, though used by Quetelet, Professor Forbes, and others, in their experiments, is allowed to be far from perfect, and it is only by uncommon care and caution that results can be obtained from it worthy of being depended on. It is an instrument which cannot well be described in mere words, and all that may be said of it here is, that it is so contrived as to indicate to the experimenter, on a dial-plate, the physical power resident in the loins and arms of the parties subjected to trial.

Observing the extraordinary displays of physical power and energy frequently made by savages, scientific men were long of opinion that civilisation diminished the strength of the human frame. Other circumstances tended to foster this belief. The Negro is possessed of longer arms, or at least forearms, than the Caucasian, holding in this respect, it is worthy of remark, a middle place between the white and the ape, which latter creature has arms of great length. 'I measured,' says Mr White, 'the arms of about fifty Negroes, men, women, and children, born in very different climates, and found the lower arm longer than in Europeans, in proportion to the upper arm and height of the body.' The same writer says that whites of 6 feet 4 inches, whom he measured, had shorter arms than Negroes of middle size. Similar sources of physical superiority appeared to voyagers to be possessed by the Pacific Islanders, the Malays, and many other uncultivated races. But more attentive observation has disproved the supposition. The voyager Peron took with him to the southern hemisphere a dynamometer, with which he experimented on the following number of individuals: twelve natives of Van Diemen's Land, seventeen of New Holland, fifty-six of the island of Timor (a fine race of men), seventeen Frenchmen, and fourteen Englishmen. The following numbers express the mean result in each case, the strength of the arms and loins being respectively put to the test. It is by lifting a weight that the strength of the loins is tested with the dynamometer:—

	Mean Strength.	
	Arms.	Loins.
	Kilogrammes.	Myriogrammes.
1. Van Diemen natives, . . .	50.6	...
2. New Hollanders, . . .	50.8	10.2
3. Timorians, . . .	58.7	11.6
4. Frenchmen, . . .	60.2	15.2
5. Englishmen, . . .	71.4	16.3*

The highest power of arm shown by any of the Van Diemen natives was 60; by the New Hollanders, 62; while the lowest in the English trials was 63, and the highest 83. In *lumbar* power, or that of the loins, the highest point reached by a New Hollander was 13; the lowest of the English was 12.7, and the highest 21.3.

'These results,' says Mr Lawrence, 'offer the best answer to the declamations on the degeneracy of man. The attribute of superior strength, so boldly assumed by the eulogists of the savage state, has never been questioned or doubted. Although we have been consoled for this inferiority by an enumeration of the many precious benefits derived from civilisation, it has

always been felt as a somewhat degrading disadvantage. Bodily strength is a concomitant of good health, which is produced and supported by a regular supply of wholesome and nutritious food, and by active occupation. The industrious and well-fed middle classes of a civilised community may be reasonably expected to surpass in this endowment the miserable savages, who are never well-fed, and too frequently depressed by absolute want and all other privations.' Such is the case, as Peron's experiments show. But indeed the same thing is shown by a hundred historical facts. The Spaniards, on their first visits to the New World, found the natives much weaker than themselves; and this was proved not only by hand-to-hand struggles, but by the labour of the mines, in which the Indians were far deficient. The backwoodsmen of the States have always shown themselves stronger in single combats than the Indians. The Russians of Europe, also, are said by Pallas to excel the Mongol tribes of the empire to a remarkable extent in physical power.

Proper and extended comparisons are yet to be made of the relative physical power of the various Caucasian nations. The following table of Professor Forbes gives us at least a glimpse at the comparative strengths of English, Scotch, Irish, and Belgians:—

Age.	Lumbar Strength in Pounds.			
	English.	Scotch.	Irish.	Belgians.
15	...	290	...	204
16	336	314	...	236
17	352	340	309	260
18	364	360	389	280
19	378	378	404	296
20	385	392	416	310
21	392	408	423	322
22	397	410	427	330
23	401	417	430	335
24	402	421	431	337
25	403	423	432	339

The same relations are here preserved as in the previous tables, and as, with respect to weight and height at least, there could be no mistake, the probability that the last table is correct is much strengthened by the conformity in question. The difference between the Irish and Belgians is immense, the former exceeding the latter in strength by nearly one-fourth: while between the English and Belgians there is also a great difference, amounting to 62 lbs. The English, in Peron's table, showed a lumbar strength equal to about 376 lbs., a point considerably below that of the English in Professor Forbes's table. But we might expect such a difference between students and sailors, or stout colonists, which latter classes were those examined by Peron. Between the Scotch and Irish the difference is small comparatively. It is much to be wished that the example of the Edinburgh professor were extensively followed, both abroad and at home, so as to give us satisfactory views of the relative physical powers of the different European nations. Such questions, as already hinted, will be found to bear more directly on the prosperity of nations than has hitherto been commonly imagined.\*

Regnier, the inventor of the common dynamometer, was led to the conclusion, after many experiments, that between the ages of twenty-five and thirty man is at the maximum of his strength, and that he is then able, by pressing strongly with both hands, to make an effort equal to 50 kilogrammes, and to raise a weight of 13 myriogrammes. Man preserves (says the same observer) much of his physical power nearly till the age of fifty, when it diminishes progressively. The experiments of another Frenchman, M. Ransonné, made upon 345 of his countrymen, sailors of the port of Havre, give results somewhat different from those of Regnier.

\* Peron—Corrected Edition of his Voyages. (The myriogramme is nearly 23 lbs. English.)

\* We have been informed that the mere physical power of the different companies of men to whom the Duke of Wellington was opposed in his campaigns, was always with him an object of serious consideration.

## CHAMBERS'S INFORMATION FOR THE PEOPLE.

Ransonné found the mean manual power of these men to equal 46·3 kilogrammes; and the lumbar power, or that of the loins, to amount to 14·2 myriogrammes. There is every reason to believe, however, that the particular mode of using the instrument, employed by each experimenter, is the cause of such differences in its results. Quetelet's observations led to the following conclusions:—

### *Lumbar Power of Men and Women.*

Age.	Men.		Women.	
	Myriogrammes.	Myriogrammes.	Myriogrammes.	Myriogrammes.
9,	40	30		
15,	88	53		
20,	138	68		
25,	165	77		
30,	174	...		
50,	101	59		

The highest point which the dynamometer here gave, for the power of the loins in Belgian men, was 15·5, twenty-five being the age when the power reached this maximum point. The conclusion agrees very closely with that made by Peron on the French sailors of his party, who exhibited a lumbar power equivalent to 15·2 myriogrammes, falling below that of the English, which was 16·3. Other observations, however, would lead us to suppose that the difference is more in favour of the British, when compared with the Belgians, than this calculation would indicate; and this would probably have appeared had Britons been tested under Quetelet's own eye, and by his directions.

Leaving the question of comparative degrees of strength, whether in varieties or sub-varieties of mankind, a word may be said respecting the extraordinary physical powers which *individual* men of various nations have occasionally evinced. We learn from history, that Milo, a Greek, could fell an ox with his fist, and afterwards carry it home on his shoulders. Firmus, a man who lived in later times, being born in Seleucia about the reign of the Emperor Aurelian, could suffer iron to be forged on an anvil placed on his breast, his body being then in the position of an arch, with only the two extremities resting on supports. He exhibited other feats of muscular strength, nearly all of which were successfully imitated during the past century by a German named Van Ekeburg. This man sat down on an inclined board, with his feet stretched out against a fixed support, and two strong horses were unable to move him from his position. In imitation of Firmus, he lay down, with his body in the form of an arch, and allowed a stone, one foot and a-half long and one foot broad, to be broken on his abdomen with a sledge-hammer. He also stood on an elevated platform, and by means of a rope round his waist, sustained the weight of a large cannon, a burden for several horses. A flat piece of iron was likewise twisted by him into the form of a screw.

Dr Desaguliers, a scientific person who witnessed the German's feats, showed, however, that skill was more concerned in the matter than mere strength. With the aid of some friends, the doctor actually performed many of the same feats, on the very night on which he witnessed them. The simple sustaining of the stone, it seems, was the chief difficulty in the most striking of the experiments, as the breaking of it caused little additional annoyance; and in place of increasing, the arched position of the body greatly diminished the shock of the blows. In the case of many of the other feats, in like manner, a skilful application of ordinary physical powers was found competent to their accomplishment. There appeared, nevertheless, about the same time with the German, an Englishman, named Topham, who performed equally wonderful feats by sheer strength, unaided by skill. He out-pulled a strong horse by main force, though in attempting to pull against two, he ultimately got himself hurt, being totally ignorant of the contrivances which his German predecessor used in aidance of his muscular powers. Topham rolled up pewter plates with ease, and unrolled them; he struck an iron poker, three inches in circumference and three

feet long, against his bare right arm, till he bent it to a right angle; he placed a similar poker against the back of his neck, and with a hand on each end, twisted it round till the points met in front; after which he pulled it nearly straight again, his arms acting in a most unfavourable condition while he did so; and finally, among other feats, he lifted with his teeth, and held out for a time, a strong table six feet long, with half a hundredweight hanging at the farther extremity.

We have accounts of men performing more wonderful feats than those of Topham, but they are either ill authenticated, or seem to have resulted as much from skill as strength, as in the case of the German. Topham appears on the whole to have been gifted with physical powers as remarkable as any that we can believe any human being ever to have naturally possessed, judging from the details on such matters given in merely secular history.

### MENTAL CHARACTER.

It is only a recapitulation of much which has been stated in the earlier sections of this treatise, that great differences of mental character are exhibited by the various races of mankind. The black intertropical nations generally are decidedly the lowest in the intellectual scale. They are generally characterised by great indolence, apathy, want of foresight and perseverance, as well as by gross barbarism and superstition. The idea of a social community has made but a small advance amongst them, though more amongst some tribes than others. The lowest of the class are to be found in Australia and some of the islands of the Pacific. Yet there is scarcely any tribe of blacks so mean but they possess certain traits of mind calculated to produce respect, being in some instances surprisingly ingenious in fabricating particular articles of dress, or in the management of canoes and the use of hunting and warlike implements.

The red races of North America are a considerably superior race to the Negroes. Their associations for war and other purposes are upon a more complicated scale; they show many remarkable traits of ingenuity; are more persevering; are highly sensitive; and in many tribes we find kindness and courtesy approaching to our ideas of the chivalric character.

The Mongolians and the Indian branch of the Caucasians must be considered next in the scale. They have formed great states, and made advances in the arts and in science; but a stationary character appears to be impressed on them all, and ages pass without their manifesting the slightest moral or political advance upon the institutions of their predecessors. The Malayan variety exhibits a character somewhat inferior to the Mongolians, but not so different as to call for special notice.

The Caucasian variety, as a whole, stands greatly above all the rest. It is characterised by superior sagacity and sentiment, and, above all, by a progressive character, which other races have only shown in a very limited degree. The social arrangements formed by some branches of this race are the most calculated to insure the general happiness which have ever been known. Their industry and perseverance, aided by the lights which they have deduced from science, have led to the production of an amount of wealth beyond the dreams of Orientals. Their benevolence has led them not only to found institutions calculated to succour the poor and afflicted in their own country, but to exert themselves for the benefit of other nations in every region of the globe. Wherever this race sets its foot, it makes itself master—a result directly flowing from its superior energy, skill, and perseverance. Amongst the branches of the Caucasian variety, considerable mental differences prevail. The Indian branch approaches to the Mongolian variety in its want of inventive progression; and it is only in the Pelasgian branch in ancient, and the Teutonic or German in modern times, that we find the utmost development of the higher sentiments and faculties of the species.

## PHYSICAL HISTORY OF MAN—ETHNOLOGY.

### PERMANENCY OF TYPES.

This subject has been already touched upon; but it calls for some special consideration. We find some interesting light thrown upon it in a work entitled 'The Physiological Characters of the Races of Mankind considered in their Relations to History,' by Dr W. F. Edwards.

This writer cites the Jews as an example of a race who, for nearly two thousand years, have been spread throughout a variety of climes, yet have everywhere preserved their original features. In Leonardo da Vinci's picture of the Last Supper, painted three hundred years ago, the figures are represented with countenances exactly resembling those of the Jews of the present day. That the present well-known type of this people has undergone no change at any time, is proved by the paintings found by Belzoni in the tomb of an Egyptian king, probably not less than three thousand years old. These paintings represent four different races in procession—1. The natives, of a dark-brown tint; 2. Negroes, with black skins, thick lips, and woolly hair; 3. Persians; 4. Israelites, distinguished by their complexion and physiognomy. The paintings were exhibited in London, where Dr Edwards particularly examined them: he says, 'I had seen on the previous day Jews in the streets of London; I thought that I now saw their portraits.'

Dr Edwards endeavours to show that there is much error in our ordinary ideas respecting the effect of conquests in changing population. There is a tendency in savage races to sink under a superior intruding race, as the Guanches have done in the Canary Islands, the Caribbs in the West Indies, and a particular Indian race in Newfoundland; but when the original people are to a certain extent civilised, and therefore numerous in proportion to space, the law seems to be, that they continue to form the basis of the population, while the conquerors become the progenitors of an aristocratic class. Even when the cruel Ghenghis Khan deliberated as to the propriety of massacring the people whom he had subdued in the north of China, it was shown to him, and he yielded to the suggestion, that they were better spared, as being useful for producing victual and paying taxes. We see the Hindoos continuing to occupy their country on this principle, after being subjugated; and the British, though they have exterminated the intractable savages of Van Diemen's Land, seem to contemplate encouraging into their service the more docile races of New Zealand. Reason is shown by Dr Edwards for concluding that, in several European countries which have passed through the hands of various masters, the bulk of the people are still the same as in very remote times. Rome, and the Papal states, yet show a people of exactly the same type of visage with the ancient Romans, as represented in busts and upon bas-reliefs. A people of one type, supposed to be that of the ancient Gauls, were distinctly traced by Dr Edwards in eastern France and in northern Italy. He also adduces reasons for believing that the early Britons still form a large portion of the present population of England. History itself, rightly read, bears out these propositions. The Franks, who acquired the mastery in Gaul in the fifth century, were rather an army than a migratory nation. The Lombards, who overran and seized the northern half of Italy, are supposed to have only been about 100,000 in number. The immigration of the Saxons into England seems to have been upon a greater scale; but the Normans, led by the Conqueror, were only 60,000 soldiers.

The stability of the people on their original ground, and the permanency of their original character, are both shown in a striking manner by the description which Tacitus gives of the Gauls, Britons, and Germans. The Gauls he speaks of as 'gay, volatile, and precipitate, prone to rush to action, but without the power of sustaining adversity and the tug of strife; and this is the character of the Celtic portion of the French people down to the present day. He represents the Britons

as cool, considerate, and sedate, possessed of intellectual talent, and says that he prefers their aptitude to the livelier manners of the Gauls. The same mental qualities characterise the English of the nineteenth century, and they and the French may still be contrasted in similar terms. He describes the Germans, allowing for the state of their civilisation, as a bold, prudent, self-denying, and virtuous people, possessed of great force of character; and the same features distinguish them still.\* It is scarcely necessary to remark, that the blue eyes and fair hair which the Roman historian attributes to the Germans, are still widely-prevailing features of their external physiognomy.

The perseverance of national types is supported by circumstances favouring the same conclusion with regard to individual families. It has been repeatedly observed, in galleries of family portraits, that a particular style of face, or some shape of feature, is handed down from one generation to another, or, passing perhaps over one or two generations, revives in a third. A certain thickness in the under lip has been thus hereditary in the royal family of Austria for several centuries. The face of the British royal family has experienced nothing but minor changes since the Electress Sophia, if not from earlier generations. Mr William Howitt, in his work entitled 'Visits to Remarkable Places,' gives a portrait of a school-boy who was pointed out to him at Stratford-upon-Avon as a descendant of Shakespeare, and it is unquestionable that the face has a considerable resemblance to that of the great dramatist. The present writer may be allowed to state, that he has seen a claimant of the Wintoun peerage in humble life, bearing precisely the peculiar physiognomy of two or three of the children of the baron of Queen Mary's time, as represented in a family group painted by Antony More, and engraved in Pinkerton's Scottish Gallery. The likeness in this case was as great as is ever seen between brothers. Another circumstance, in which the writer was personally concerned, will perhaps be considered as a curious illustration of the same point. He was one day, while walking in the country, struck by the appearance of a middle-aged gentleman who passed in a carriage, and who strongly reminded him of the common portrait of Sir William Wallace. He had previously, as might be supposed, no inclination to attach any credit to that portrait, but he could not help being greatly surprised when, upon inquiry, he learned that the gentleman who had just passed was General Dunlop of Dunlop, whose mother he well knew to have been the daughter of Sir Thomas Wallace of Craigie, the last lineal descendant of a branch of the family of the Scottish hero. It may be added, that the rencontre took place sixty miles from the seat of General Dunlop. As Wallace is now known to have visited France, it is not impossible that his visage may have been painted; or, supposing the portrait not his, it is likely to be that of some early member of the Wallace-Craigie family, in which case the anecdotes would not be much less valuable as a proof of the long descent of a family face.

### Effects of Local Circumstances in producing Changes.

On the other hand, there are proofs of great alterations having been produced in the external features of races by peculiar local circumstances. The descendants of the English settlers in the American states display a considerable variation in general form and aspect from the parent nation. The children of European settlers in New South Wales, are tall, thin, and weaker than their progenitors. In the West Indies, some distinct new peculiarities of structure have been observed in the descendants of English settlers. Their cheek-bones are higher, and their eyes deeper set in the head, than those of the English nation generally. In these respects, they approximate to the form of the aboriginal races of the American continent and islands;

\* Essay by Mr Combe in Morton's *Crania Americana*.

and it has been pointed out that such a form is useful in protecting the eye-sight from the glare of the tropical sun. The Creoles have also cooler skins, and are keener of sight, and more supple in the joints, than the English. It has been remarked of the descendants of Africans in the United States, that, after three or four generations, their features lose much of the native African cast, and approximate to those of the white people, the mouth becoming smaller, the eyes lively and sparkling, the nose higher in the ridge, and the hair considerably longer and less crisp.

Analogous circumstances are observed amongst the lower animals. For example, the woolly sheep, brought into a tropical climate, loses its fleece, and retains only a thin coat of hair. The hogs of Cuba, all of which are descended from a European stock, are twice as large as modern European hogs. The horses which run wild in Paraguay, though all descended from variegated European races, are now of one peculiar colour, which we cannot doubt is the effect of some peculiar local circumstances. 'On considering these and analogous phenomena,' says Dr Prichard, 'we can hardly avoid concluding that the variations of animals proceed according to certain laws, by which the structure is adapted to the necessity of local circumstances.' If such be the case, it must be held as evidence favourable to the supposition that all the races are sprung from one stock. The variations might in that case be regarded as altogether produced by external conditions operating during a long course of ages. That the inhabitants of certain regions should be stamped with certain physical characteristics, is indeed nothing more than what may be expected; and hence the absurdity of laying hold of every little difference of dialect, every tint of skin or colour of hair, every mould of nose or contour of skull, as a warrant sufficient for a new type or subdivision of the human species.

#### CONCLUSION.

From all that has been written or learned on the subject of man's physical and social history, it appears evident that the constitutional character of the human being admits of a very high degree of culture and improvement. Nature ushers him into existence more weak and helpless than any of the lower animals, and, left uncultivated, he grows up an ignorant savage. In the most debased condition, however, in which he can be found, he possesses the rude elements of intelligence, and aspires to a destiny altogether beyond the reach of the creatures over which he has acquired dominion. His pre-eminence in the scale of being may be proximately traced to the structure of his brain, or organ of thought, which greatly exceeds in relative magnitude that of any of the lower animals; to his capacity for speech; to his upright posture; and to the mechanism of his hand, that most wonderful and multi-operative of all animal organs. His superior mental development, when operated upon by a combination of happy circumstances, usually classed under the name of education, enables him to trace effects to causes, to convey an account of his experience to his fellows, and, above all, to put not only this experience, but his numerous and varied thoughts, on record for the benefit of future generations. In this manner the savage, which man originally is, is gradually improved. Each new generation enjoys the benefit of an accumulated experience; and at last, as cultivation advances, man is found to be a highly intellectual being, with a frame more elegant and powerful than he possessed when his race was in a state of heathen darkness.

Under an All-wise Providence, man has assuredly been placed on this earthly scene to perform a part immeasurably more dignified than that assigned to the lower orders of animals, each of whose generations is in no respect advanced, and cannot possibly advance, beyond the precise and humble station which was first occupied by its race. 'In this point of view,' says the language of Lawrence, 'man stands alone: his faculties, and what he has effected by them, place him at

a wide interval from all other animals—at an interval which no animal hitherto known to us can fill up. The man-like monkey, the almost reasoning elephant, the docile dog, the sagacious beaver, the industrious bee, cannot be compared to him. In none of these instances is there any progress either in the individuals or the species.'

Elevated, however, as is the meanest among human beings above the higher of the animal tribes, it is evident that for the proper performance of his part he must employ means for advancement, else he rests in a condition of ignorance and barbarism most deplorable to contemplate. Placed in a large and beautiful world, abounding with animal, vegetable, and mineral existences at his command, and accountable for his conduct, it behoves him to pursue such a course of activity as will enable him to enjoy the full benefits of his situation. By pursuing that line of policy which leads to social melioration, he rises step by step to a high degree of civilisation, and bequeaths to posterity almost imperishable monuments of his greatness. Attaining this enviable height, should he pursue or be the victim of a contrary line of policy, he sinks in the same ratio, and perhaps with greater speed, down to the original and humble level from which he had formerly arisen.

To be assured that these are not merely conjectural speculations, we have only to direct our attention to history, wherein examples are offered of the gradual rise, the eminence, the decline, and the ultimate extinction, of civilisation. Again, like the growth of a new order of plants on the soil of an exterminated forest, we find on the spot once consecrated by deeds of human greatness, a different branch of the family of mankind, pursuing by toilsome steps a similar rise from barbarism, and asserting in their turn the exalted capacity for improvement common to all the varieties of our race.

Although it is established both by Scriptural record and geological discoveries, that man was placed on earth last in the series of animal existences, his race possesses a sufficient antiquity to embrace various instances of the rise and decay of nations at a period so remote as to be beyond the reach of ordinary history, and only known by the wrecks of man's inventive genius. Thus, in the East, are found remains of architecture and sculpture, of the origin or meaning of which the oldest known nations were altogether ignorant, and which are a puzzle to modern archaeologists. Thus, also, throughout North and Central America, there are found vast monuments of antiquity and objects of art, of a date long anterior to that of the earliest recorded nations, and which these nations looked upon with awe and wonder. The valley of the Mississippi, in particular, abounds in an immense quantity of artificial mounds of various shapes and sizes, and forts of different kinds, the origin of which is altogether unknown, but which are doubtless the remains of an extinct civilised race. This country, as is well known, was found, in the earlier periods of American discovery, in the possession of those red races usually called Indians, who are now retiring before the advance of the whites. These red races manifest no symptom of possessing, or of ever having possessed, either the power or the inclination to erect such works: they disclaim having erected them, and in their traditions speak of them as the productions of a people who were their predecessors in the country, and have long been extinct.

To close this brief and imperfect sketch of man's physical history, we have only to add, that from all the existing remains of antiquity, both in the eastern and western hemisphere, and from all written history, it conclusively appears that mankind, taken in the mass, have in no respect degenerated in physical structure; but that individually they are as tall, bulky, and powerful as they were in the earliest periods of their progress, while, as respects mental qualifications, they now, in all enlightened societies, occupy a station in the scale of being which it is reasonable to conclude was never before enjoyed.

# LANGUAGE.

LANGUAGE may include all signs, marks, or indications that are employed to signify or make known something different from themselves. The ringing of a bell, the hoisting of a flag, the sounding of a trumpet, are acts performed not for their own sake, but for the purpose of conveying some message or communication which has been connected or associated with them.

There is a well-known power in the human mind, called the Power of Association by Contiguity, which enables us to retain conjoint impressions of objects or occurrences that have been experienced together, and to revive the entire image of an aggregate whole through the presence of any one of its individual parts. By this power we can fasten together the notions of a sign and of a thing signified so firmly, that by seeing or hearing the sign we are reminded of the thing, and by witnessing the thing we can recall the sign; by what is seen we can be aware of what is unseen; and thus the operations of the human mind are extended from a narrow to a boundless sphere.

Language, however, properly means the particular system of signs universally employed and understood in the intercourse of human society, and applicable to every case of the communication of meaning or thought. Articulate speech, extended in civilised countries by the art of writing, is the contrivance everywhere answering to this description.

The signs made by human beings through their bodily organs are usually divided into *Natural* and *Artificial*. The natural signs are the instinctive and untaught movements of the body which arise out of the effort to express feelings, passions, or desires, and are what the lower animals are to some extent capable of producing. They consist of the tones of the voice, the play of the features, the movements of the limbs, and the gestures of the body. Every conspicuous passion or emotion gives a distinct expression to these various organs, by putting them into the state most in harmony with itself; and each different expression tends, by an instinctive operation of fellow-feeling, to call forth its proper emotion in those who witness it. The howlings and contortions of pain, the quakings of terror, the fixed gape of astonishment, the wallings and tears of wounded affection, the swellings of rage, the eagerness of pursuit, the cry of victory, the placid repose of contentment, the outburst of the ludicrous, the bending of reverential feeling, the urgent movements of intreaty, are all peculiar effects on the bodily organs, characteristic of the several feelings, and capable of communicating these feelings at once, and independently of all instruction, from one human being to another. But these signs are by far too limited to express the wide variety of thoughts and sentiments which the human mind can entertain, and which require to be communicated between man and man. Even in the most perfect development of this mode of expression, in the stage pantomime or dumb show, it is very obscure when it attempts to convey anything beyond the most obvious ideas and feelings. So far as it goes, however, it is the most powerful means of impressing one man's feelings on another, or of inspiring a multitude with a common enthusiasm. Hence it continues to be used along with artificial speech, as is seen in the gestures, grimaces, movements, and modulations of conversation and oratory. It is the resource of children, and of persons ignorant of one another's language; and it is partially employed by the deaf and dumb.

The artificial signs are made by means of certain sounds of the human voice, which are called Articulate, or jointed, because two or more of them can easily be joined together, or pronounced in unbroken utterance, so as to form combinations of sounds; and as

these combinations may be varied without end, it is possible by their means to obtain a distinguishable sound or separate name for everything which forms the subject of communication or thought.

The different ways in which language may be viewed, and the various purposes which it serves, have given birth to as many different sets of rules or principles concerning it. One of these classes of principles constitutes the subject of *Grammar*; another refers to *Pronunciation*; a third forms what is called *Rhetoric*; a fourth enters into the science of *Logic*; and a fifth takes a larger sweep than any of these, and includes *Universal Grammar*, together with the explanation of the origin and progress of language considered as a part of the *civilisation of mankind*.

*Grammar* shows how to arrange words into sentences in all cases when several different names have to be brought together in order to express a meaning. It classifies and describes the different kinds of names, such as noun, verb, adjective, &c.; explains the exact meaning and use of the changes or inflections that some of them undergo; and teaches the proper mode of joining them under all circumstances. The inflections and arrangements of words being different in different languages, each tongue has a grammar appropriate to itself. Thus we have English grammar, French grammar, Arabic grammar, and so forth. There is also peculiar to each language a system of pronunciation, which may be considered as a branch of knowledge connected with it. *Rhetoric* lays down maxims for giving language its highest possible effect in communicating ideas and sentiments from one person to another; it teaches how to use words for the purposes of exposition, persuasion, and pleasing, and for composing the works of art that are founded on speech, such as the various forms of poetry. *Logic* views language solely as an instrument of inference or reasoning—that is to say, for extending knowledge wider than experience, for discovering the past, the future, and the distant, from the present. General terms, classifications, and propositions, belong to the word-machinery of logic. *Universal grammar* is founded on a comparison of languages in general, and treats of the parts of speech and peculiarities common to them all. It distinguishes the primitive classes of names from such as are derived, and explains the process of derivation. But a still wider inquiry is requisite, in order to describe the manner in which the entire body of language has grown up and gradually shaped itself into the various forms which we find among the different languages of the globe. Universal grammar, coupled with this further investigation, forms the subject of the present treatise. It sometimes receives the name of *Philology*.

The branches of knowledge comprised under grammar, logic, and rhetoric, are of the greatest utility in the business of daily life; but philology is chiefly to be considered at present as a subject of high speculative curiosity. It gives a wide field for the human intellect to explore, and it derives a deep and mysterious interest, from touching on things transacted before the dawn of history, and from its attempting to search out the ancient seats of nations and the affinities of remote peoples.

We shall consider the subject under the following heads:—1. The human voice, and the formation of letters and words. 2. The parts of speech, and their relationships according to the doctrines of universal grammar. 3. The origin and progress of language in general. 4. The languages of the globe, their arrangement into families, and the peculiarities which distinguish them from each other.

## THE HUMAN VOICE—FORMATION OF LETTERS AND WORDS.

The vocal organs of man are formed by certain additions being made to the organs of chewing, swallowing, and breathing. For the purposes of sound they are set in action by the lungs, or rather by the chest compressing the lungs, and driving a current of air through the windpipe. The windpipe, instead of being a simple tube, is mounted inside with two flaps running from before backwards, and leaving a narrow slit between them. These flaps are attached to movable pieces of gristle or cartilage, that seem, as it were, to clasp the windpipe between them; and by muscles attached to these, the flaps or vocal chords can be tightened or relaxed at pleasure. In their relaxed state, the air passes through the windpipe with no other noise than we hear in simple breathing, or at most in whispering. But if they are tightened by muscles drawing the cartilages asunder, and are thus connected by firm muscular bands with the bones of the head, and if the breath is sent through the windpipe strongly, an audible and powerful sound is produced, depending on the resonance of the skull, in the same way that the sound of a violin depends on the vibrations being communicated by the strings to the whole solid mass of the instrument. By varying the tightness of the vocal flaps, and the size of the slit between them, and also by changing the strength of the blast from the lungs, tones of different strength and pitch may be produced. The whole of the *musical apparatus* of the human voice is contained in the windpipe with its cartilages and vocal chords.

It is found, however, that the sound in passing through the mouth may have its character altered, not in respect of musical pitch or strength, but in a way to give it a distinguishable effect on the ear. If a person singing any one note of the musical scale with the mouth gaping open, were to continue the same note with the mouth nearly shut, the sound would be identical in its musical effect, but in respect of character or expression, it would appear to be different. There would seem to be a change of shape in the sound itself. This peculiarity of sounds, which is dependent on the form and movements of the mouth during their utterance, is termed their *articulate character*; and sounds strongly marked with it are called *articulate sounds*. The musical and the articulate characters of sounds arise from different organs, and are governed by totally different principles. Their connection with the general framework of body and mind is also totally different. The windpipe sounds are combined into melodious successions, according to one class of feelings, while the mouth sounds are connected under the guidance of sensibilities which have very little in common with musical taste.

For articulate sounds, therefore, we have to refer to the construction and movements of the mouth. Every one knows its general form and parts, and we need only call attention to the movements performed in it. These are—*1st*, The movement of the lower jaw, which enlarges or contracts the height of the cavity, or its dimensions from above downward, and opens or closes the aperture of the teeth; *2d*, The movements of the cheeks, which distend or lengthen the mouth in the cross direction, and, along with the lowering of the jaw, open the cavity to its fullest dimensions; *3d*, The contraction of the ring of the mouth or lips, as exemplified in the whistling position; *4th*, The elevations and depressions of the upper and lower lips, which combine with and modify the other movements; *5th*, The movements of the tongue. These are very various:—*1st*, It may be protruded outwards, or drawn in to the back of the mouth; *2d*, It may be bent or curled either up or down; *3d*, It has a free motion from side to side. By these motions the tongue can come into contact with any point in the cavity, and make the touch by different parts of its own surface.

All these movements tend to alter the shape of the mouth, and with this the expression of the sound which

issues from it. Hence the possible variety of sounds that may arise is unlimited. The distinguishable sounds, however, are not very numerous. They are arranged into various kinds:—

*1st*, We have what are called the *vowel sounds*. When all the parts of the mouth are in one fixed position, giving a free opening outwards, and remain fixed during the emission of a sound, so as to exercise no other influence than arises from the mere shape of the cavity, a vowel is produced. Thus in sounding *ah*, the mouth is opened, and the jaws, cheeks, lips, and tongue are fixed dead in one posture; so in sounding *uw*, the posture, though different from the former, is still a quiescent or dead posture. By altering the shape, the sound is altered; but so long as it is an unalterable shape, a vowel is the result. The vowels that are most markedly distinguished from each other, are such as arise from the most widely different arrangement of the parts of the mouth. The five vowels, *ah*, *ee*, *ay* (*say*), *oh*, *uh*, are the five most distinct sounds resulting from the various extreme positions of the organs, and may be called the five fundamental vowel sounds, having a greater difference from each other than any one of them has for any other sound distinct from them. Thus the English vowel sound *awe*, arises from a middle position between *ah* and *oh*. The English sound of *i*, as in *sit*, is very little different from the fundamental *ee*; *set* is very near *say*; and even *u* in *but* is but one remove from the same sound. The *a* in *eat* is a modification of the fundamental *ah*. Every one of these sounds can be varied by a slight shading, so as to produce several that a fine ear can distinguish. In fact, no two nations pronounce similar vowels exactly alike, and even in the individuals of the same nation slight differences are very common: sometimes the people of one province can be distinguished by the shade that they give to the fundamental letters of the alphabet. Thus the Scotch sound of short *i*, as in *sit*, is often too near the *ay* sound, whereas in correct English pronunciation it should be nearer the *ee*.

But the varieties of vowel utterance can be immensely extended by combinations of vowels, or by changing from one to another within the same breath, as in *boy*. This gives rise to what are called *diphthongs*. There are some of these diphthongs so natural and easy, that they are adopted as regular alphabetical sounds, on which differences of words are founded. In English there are three proper diphthongs: these are the sounds in *sigh*, *now*, *boy*. The first is a combination of *ah* and *ee*; the second of *oh* and *uh*; the third of *oh* and *ay*. There are other diphthongs less perfect than these, or in which the sounds do not run together so completely. Thus the *wa* in *quake*, the *we* in *twined*, are regarded as diphthongs less pure than the others.

*2d*, Of the class of sounds called *consonants*, a great many divisions have been made. They differ from the vowels in requiring some of the parts of the mouth to perform particular movements, in order to their being uttered. A certain play of the tongue, teeth, or lips, is necessary to each of them. This play may vary from the mere quiver of the tongue in sounding *s*, to the forcible shutting off of the sound by the sudden closure of the lips in *p* final. The sounds, *p*, *t*, and *k*, are connected either with sudden closures or with sudden explosions of the sounding emanation, and are therefore called *mutes*, and also *explosive letters*: *p* is formed by the lips, *t* by the point of the tongue striking the roof of the mouth near the teeth, *k* by the back part of the tongue striking the back part of the roof. Of these, *p* is the easiest to sound, and the first learned by children, and *k* the most difficult. The *p*, being formed by the lips, is called a *labial*, *t* a *palatal*, and *k* a *guttural*, or throat-formed letter. And as all the consonants are formed more or less nearly in one of these positions, a general division can be made of them into labials, palatals, and gutturals. Six distinct labials are enumerated, depending on different ways of sounding with the lip closure. The mute or explosive *p* has

been mentioned; next to it is *b*, produced by a less violent closure, which allows the voice to be heard during the act, as any one will feel by sounding *cup* and *cab*. The third labial is *m*, which is still farther removed from the sudden extinction occurring with the *p*; a free communication is opened with the nose for the egress of the air, and the sound can be made continuous like a vowel; in other words, we have the humming sound; this is the *nasal* labial, while *b* is called the *vocal* labial. The fourth labial is *f*, produced by the upper teeth and the lower lip coming together, and the breath passing through them without voice; this is the whispered or *aspirate* labial. When the vocal chords are tightened up, and the hard sound of the voice sent through this closure, we have *v*, or a second vocal labial, called the *vocal aspirate*. Lastly, a sound may be sent through the closed lips, making them vibrate or shake like a reed, as in the sound *pr*; this is the *vibratory* labial, or the labial *r*. A similar series can be described in the palatals. The mute being *t*, the vocal is *d*; the nasal are *l* and *n*; the aspirates are *th* (*thumb*), *s*, *sh*, arising from slightly-differing positions of the tongue in its contact with the palate: the vocals, or audible forms of these, are *th* (*thy*), *z*, *j*; the vibratory palatal is the common *r*. The gutturals likewise show the same list of varieties. First, *k* mute; then the vocal *g*; the nasal *ng*, a simple sound, though spelt in our language with two letters; the aspirate *ch*, as in *loch*, together with the fainter form *h*; the vocal aspirate *gh* unknown, and almost unpronounceable by us; and the vibratory *ghr* occurring as a burr in some people's utterance. This classification, which was first proposed by Dr Arnott, may be summed up in the following table:—

	Labials.	Palatals.	Gutturals.
Mute, . . . . .	<i>p</i>	<i>t</i>	<i>k</i>
Vocal, . . . . .	<i>b</i>	<i>d</i>	<i>g</i>
Nasal, . . . . .	<i>m</i>	<i>l, n</i>	<i>ng</i>
Aspirate, . . . . .	<i>f</i>	<i>th, s, sh</i>	<i>ch, h</i>
Vocal Aspirate, . . . . .	<i>v</i>	<i>th, z, j</i>	<i>gh</i>
Vibratory, . . . . .	<i>pr</i>	<i>r</i>	<i>ghr</i>

Besides these there are two letters essentially of the nature of vowels, but having in many cases the force of consonants. These are *w* and *y*; the one a prolonged or double *u*, the other a prolonged *e*. The peculiar effect of each is brought out when followed by another vowel, so as to make a diphthong. The *w* has a labial character, the *y* a guttural.

The nasal letters may be so attenuated as to lose the character of consonants, and merely give a nasal twang to the vowel adjoining. This is the case in the French pronunciation.

Speech is generally a mixture of vowels and consonants. The utterance most easy to sustain, and most agreeable to the ear, is formed by a vowel and consonant alternating. Vowels alone produce too feeble an impression to make a distinct language. As a general rule, abrupt sounds have the most marked effect on the ear; so that a mixture of these is necessary to make a clear and intelligible series of sounds. Hence the mute consonants *p, t, k*, have a high value, as characteristic and unmistakable letters; but the hissing sound of *s* is remarkable for its piercing effect on the ear, and for its being so peculiar and distinct, that no other sound can be confounded with it; and it is therefore an exceedingly useful member of the alphabet. The same remark, in a less degree, applies to *r*, which leaves a vivid impression, and is not easily mistaken for any other sound. The aspirates generally, *f, sh, ch, h*, have a certain amount of the hissing peculiarity, but none of them are so intense as the pure *s*. They have all, however, a distinct and sharp effect on the ear.

The three mutes, *p, t, k*, and the three vocal sounds corresponding, *b, d, g*, cannot be pronounced without the help of some vowel; hence in their pure form they are abstractions rather than realities. Almost all the others permit of themselves a constant passage of the breath, and can therefore be sounded without the addi-

tion of vowels. Thus *m, n, l, r, ng, f, s, &c.* can all be sounded each by itself alone, although the addition of a vowel will in general make the exercise more easy. Thus *mnee* is easier and pleasanter than *mmm*. The passing into a vowel is a passing from a forced to a free posture of the parts of the mouth. But as these letters can be sounded with more or less difficulty by themselves, a number of them have been called *semivowels*, or we might call them thick or viscid vowels. They have a middle character between the vowels and the six consonants above-mentioned. They demand a less violent exertion than the abrupt consonants, but a greater exertion than the vowels.

Each of the vowels, standing alone, may have a distinct meaning attached to it, or be an intelligible sound—the name or expression of an object or thing. But, in general, intelligible sounds are made up at the very least of a vowel and consonant. The vowels alone would yield very few names, even if each were made significant; and no consonant by itself is the name of anything. So essential is the union of a vowel and consonant to make an intelligible sound, that it has been proved that the letters of the Hebrew alphabet (which used to be reckoned an alphabet of consonants without vowels) have really the force of a vowel and consonant taken together; hence in writing with them vowels were unnecessary, but when the letters came to be accounted pure consonants, it was requisite to imagine vowels to complete the spelling of the words. A single articulate union of a vowel and consonant makes a syllable, as *ab, be, up, me*; but it is possible to have a greater number of letters, and yet make one unbroken sound. A consonant can be sounded with a vowel before or a vowel after it; hence a vowel may be set between two consonants, as *bad*, making no more than one syllable. A syllable can be extended still farther by joining a semivowel consonant with another, it being possible to sound both along with a vowel, as in *blend*; and in some cases three consonants can be joined, as in *strength*. The letters *l, m, n, r*, have a great facility in going along with the more abrupt consonants to make single syllables; and from their effect in softening down the sudden harshness of the mutes and vocals, they were called by the Greeks *liquids*, and were very much employed in their language, for the sake of melody and softness, both as the single consonants of syllables, and in union with other consonants. The power of making syllables begin or end with double consonants enables us to increase to a manifold extent the number of distinct syllables which it is possible to form out of the letters of the alphabet, and thus enlarges the scope of articulate language.

Each distinct vowel may be the basis of a range of syllables, by being bedded in all the different varieties of consonants and their combinations. Thus we have *a, e, i, o, u, &c.* syllables. Each diphthong may also yield a train of syllables. It is possible further to vary some of the vowels without changing their essential expression, so as to produce a new class of syllables that shall be distinct from those founded on the ordinary form of the vowel. For example, there may be a long and a short form of several of them; as in the case of *not, nought*, where the vowel is the same, but short in the first word, *not*, and long in the second, *nought*: so also in *meet, mete*, where we have the short and long *e*.

If we revert again to the table of consonants, we may remark that, as regards ease of pronunciation, the labials are before the palatals, and these before the gutturals. It is easier to perform the articulate movements of the lips than it is to perform the movements of the palate and throat. Children can sound *m* very early; and before being able to pronounce *thumb*, they say *fumb*. But looking at the table in the other direction, or according to the classes, *mute, vocal, &c.* it may be observed that the mutes and aspirates, *p, t, k*, and *f, h, ch, &c.* are more easy than the same letters made vocal, *b, d, g*, and *v, dh, gh, &c.* and also more easy than the nasals *m, n, ng*. Hence some nations use the mutes

and aspirates where others employ the vocals in sounding the same words. Horne Tooke, whose philological work, 'the Diversions of Purley,' is one of the most instructive of its class in our language, gives a version of an English sentence by a Welshman, who turns *vow* into *fow*, *by* into *py*, *that* into *dhat*, *Jehin* into *Shenkin*, *is* into *iz*, *God* into *Cot*, and *wizard* into *wissart*.

The tendency of some nations to prefer one class of articulations to another, is one of the causes of difference of speech when the language employed is substantially the same. Examples of this will be given when we come to speak of the peculiarities of the Asiatic and European tongues.

There are certain combinations of letters, both vowels and consonants, that are more easy to articulate than others; and in the usages of speech there are preferences of one combination to another. If we take the leading vowels in the order *ee*, *ay*, *ah*, *oh*, *uh*, there is a gradual lengthening of the mouth outwards in their utterance: with *ee* the mouth is flattened and shut; with *ay* it lengthens out to some extent; with *ah* it is still longer; and with *uh* it is longest of all. Now, in pronouncing the consonants, it is found that the labials may be best pronounced with the mouth lengthened, and the gutturals with the mouth shortened—that is, a labial utterance is very conveniently combined with a *u*, as *mu*, *fu*, *pooh*; and a guttural combines readily with an *ee* or *ay* sound, as *kee*, *kay*; *eke*. So there is a certain conformity of position between the palatals and the middle vowels *ay* and *ah*, but this is not sufficient to make a conspicuous harmony out of their combinations. The training of the human voice is, however, in general, sufficient to get over the partial incompatibilities here spoken of, and to enable it to combine labial consonants with guttural vowels without any sense of difficulty. The word *peep* will seem as natural to most people as *poop*. But it is possible that this principle may have acted to some degree in the early formation of languages.

We have already spoken of certain cases of the union of consonants, and have described the classes of consonants which can most readily go together in the same syllable. A different case of union arises when syllables are joined together in words. The union of different syllables is apt to be less perfect than the union of vowels and consonants in the same syllable; but the endeavour of all highly-improved languages is to make the one as perfect as the other. The Greek and Latin uniformly adopted the plan of changing the first or last letters of syllables to make them join easily with others. The preposition *in* becomes *im* in Latin when it has to go before a word beginning with *m*: thus we have *imminent* instead of *inminent*, which would have been a harsh combination. So the word *syllable* itself, which is Greek, begins with the preposition *syn*, which would have made *synlable*; but the *n* has been changed into an *l*, and the sound of the word becomes much more melodious. The most perfect of all ways of uniting two syllables is to make them join upon the same letter; the union in this case even exceeds the union of the most nearly related vowel and consonant; in fact, it is a complete fusion. When the two touching letters are not the same, the next best fusion is when they are of the same class, as mutes, vocals, aspirates, &c. Thus in *picture*, the *k* and *t* sounds being both mute, make a much more natural succession than if one had been mute and the other vocal, as *pickture*; the change from the guttural mute *k* to the palatal mute *t*, is far less violent than the change from the guttural mute to the vocal palatal. So the word *diphthong*, whose proper pronunciation is *diphthong*, would be more easy to utter if it were *difthong*, which is in fact a very common way of pronouncing it. The Greek word for seven is *hepta*; but in the word *hebdomadal*, derived from it, there is a change from the mute to the vocal form of both consonants: such a combination as *hebdomadal* is not to be found in the Greek language. For mere shortness of pronunciation, the fusion of syllables is had recourse to, as well as the omission of letters that can be spared,

or whether they can be spared or not; and this practice, which prevails in all languages, has the greatest sweep in those which have not been fixed by alphabetical writing, written literature, and a code of grammatical rules. Thus in English the proper name *Saint Clair* becomes *Sinclair*; the ancient termination *like* has been universally shortened into *ly*; *goodly*, *truly*, are instead of *goodlike*, *truelike*. Additional syllables are, moreover, swamped entirely by breaking down the middle barrier of consonants, or by absorbing the vowel of one of them: the first is common in the ancient languages, the last is seen abundantly in English, as in *cleft* for *cleaved*, *learnt* for *learned*.

The interval between word and word is of course more decided than between syllable and syllable. There is supposed to be something like a distinct pause of the organs between one word and another. But there is a sufficient closeness in the articulation of successive words to demand a certain degree of attention to the harmonising of the letters that are concerned in the transition. It so happens, however, in this case, that a harsh transition is formed by the very succession which is the most flowing of all between two syllables—that is, when one and the same letter ends one word and begins the following: as when we say—has seen, run now, call low. This succession is too flowing to admit of the necessary pause, and hence the awkwardness of it. In languages where vowel endings of words are common, there is a regular practice of eliding or sinking one when two come together—one of them at the end of the first word, and the other at the beginning of the word following; it being in general not so easy to sound two vowels in close and yet distinct succession, as when a consonant divides them. In English, this principle is observed in the use of the indefinite article, which is *a* before a vowel, but *an* before a consonant.

The vowels and consonants which are allowed to go together, and the laws that govern the succession of the various letters, are different for different languages, and have to be stated among the peculiarities of each. This is called the vocalic harmony of a language, and we shall see examples of it afterwards.

Words are sometimes of one syllable, sometimes of two, three, four, five, or upwards. When a word has several syllables, it is usual to put more stress on some of them than on others in the act of pronunciation; the superior stress being called *emphasis* or *accentuation*. In English, the singling out of one syllable for especial stress is carried to a very great length, perhaps farther than in any other tongue; and the effect of this is to make our speech the extreme opposite of singing or chanting, which lays equal stress on all syllables alike, and varies only the time and the musical note of each. Thus our pronunciation of the word *difficulty*, is as far removed from the action of singing as any utterance can be. The Latinised languages of the continent—the French, Spanish, and Italian—have a more near approach to the sing-song; and we are taught to believe that the ancient Latin and Greek had still more of the same peculiarity; at least we are accustomed in our pronunciation of these languages to abstain from the discriminating emphasis of our own speech, and to draw the successive syllables of the words, keeping as closely as we can by the sole distinction of long and short.

In English, it does not always happen that each word has an emphatic syllable. The monosyllabic particles, *a*, *an*, *the*, *to*, *and*, &c. are rarely emphatic; they usually fall in with the unemphatic syllables of the adjoining words. Thus when we say, 'Beauty is a thing to be sought for and admired,' there are only four syllables that receive a full emphasis. Among the others there is a slight difference of accentuation, but at best it only rises to a secondary emphasis; as in the word *is*, coming between the short syllables *y* and *a*, and in the first syllable of *admired*; it being impossible to pronounce a train of short syllables without increasing the stress on every second or third.

It is probable that one of the changes gradually coming over human speech has been from the music of tone to the music of syllables and varied emphasis; in other words, we have advanced more and more into the proper qualities of speech as distinguished from song. To produce a succession of articulate vowels and consonants that harmonise in their utterance and effect on the ear, and vary the stress of the voice in pronouncing them, has nothing whatever to do with the art of giving pleasure by a succession of musical notes; and consequently the perfection of each follows its own peculiar laws without interference with the other.

## UNIVERSAL GRAMMAR.

Under this head we have to consider what are the essential parts of speech common to all languages, and how far they seem to be formed out of one another. Notwithstanding the innumerable varieties of dialect that we find in the peopled earth, there are some respects wherein all languages must coincide, from the identity of human nature and the external world. The things to be expressed are in a great measure the same everywhere; the organs of human speech and hearing, and the structure of the human understanding, have an essential similarity throughout the human family. The purposes to be served by speech are very much alike; and the attributes of perspicuity, clearness, brevity, strength, beauty, &c. which give it all its efficiency, are attained by very much the same devices.

1. In the first place, language must be governed by the nature of the things to be named and described by it. If the world around us were very different from what it is, all our sensations, thoughts, reasonings, and modes of discourse would be different. In a dead frozen universe there would be no need for active or passive verbs; if no two things were alike in any respect, there would be no such thing as general terms; if every object had only one single quality, or affected the human mind in only one way, adjectives and adverbs would be wholly unknown. The same dependence holds between the parts of speech and the wants, desires, purposes, and peculiarities of human nature. If there were no dependence of one man on another, and no common action, we should not have an imperative mood nor a plural number. If God had not made man male and female, the three genders would have been reduced to two. The tenses of the verb are a device expressly adapted to a being who looks both before and after.

Mr John Stuart Mill, in his great work on logic, has given an account of the fundamental kinds of names and of nameable things, which serve as a basis of universal grammar as well as of logic. A name may be defined as an articulate utterance associated with a thing, for the purpose of recalling the thing to ourselves or suggesting it to others. Articulate utterances, we have seen, are divided into letters, syllables, and words; these last being identical with intelligible names. It is not, however, universally true that each word is the name of a single thing, and neither more nor less: it often takes several words to name a single thing, as when we say, 'a burial-ground,' 'a wolf in sheep's clothing,' 'an officer that distinguished himself at Waterloo.' The most perfect scheme of naming which has yet been devised for any class or species of things—that is to say, the nomenclature of natural history—employs uniformly two names to each object, as *populus alba*, the white poplar.

The first division of names, according to Mr Mill, is into individual and general; the second into concrete and abstract; the third into positive and negative; and the fourth into absolute and relative: but for the detail of these we must refer the reader to the number on Logic (73).

The things denoted by names fall under two great classes, which it is equally important to recognise both in grammar and in logic. The one class refers to objects considered simply as existing, or as conceivable, each by itself apart; the other class contains the names of

affirmation, which uniformly connect together two or more objects. Thus the various feelings, thoughts, passions, volitions of the human mind, the mind itself, the things without us, forming the external universe, may each have a name appropriated to it, and connected in our minds by association, so as to recall the thing or convey the notion of it at pleasure. For example, when we simply pronounce the names sweetness, recollection, anger, resolution, star, pint, horse, John, we do nothing more than fix attention upon the objects named: beyond assuming their existence, and reviving the idea of them, we do not say or affirm anything about them. This class of names is well known in grammar as the *nouns*. But when we bring two objects together, and declare some invariable connection to exist between them, we make an additional effort of mind, and we require a mode of marking it. Thus when we say, 'honey is sweet,' we name two objects—one an external substance, the other a sensation: but we do something more—we bring them together in such a way, that a listener would not merely have the notions of both brought to his mind, but would be induced to put himself into a train of actions in consequence. Sweetness is a thing to excite human desire; and if a peculiar object is declared invariably to possess it, and if that object is accessible, it is sought after and used for the sake of the sweetness. Now a word that connects two different things with so secure a bond, that we feel sure of finding both if we find one, is a totally different thing from a mere name of an isolated object: the one indicates only a conception, the other causes belief, trust, confidence, and the readiness to pursue a train of actions in consequence. This second class of names is termed in grammar *verbs*, or words by pre-eminence. *Action* resides in them, whereas in the nouns there is nothing but mere contemplation. All the powers, properties, activities, and laws of nature require verbs in order to express them; there is no such thing as truth, or its opposite, falsehood, in any set of words not containing a verb. Hence verbs are essential to knowledge, belief, and action; and they grow out of the effort to express or indicate these. All the sciences have verbs for the connecting links of their propositions; all history and narration demands the use of verbs; all commands, purposes, desires, volitions, must be expressed by their help. 'Circle' is a mere thing, exciting only a notion; 'a circle contains the largest space of any figure with the same circumference,' is a proposition, a truth, a law of nature, a thing that human beings can rely and work on; and a verb is essential to its expression: omit the word 'contains,' and the adamant link is dissolved out of it; it is neither a truth, nor a law of nature, nor a groundwork of human action: it is two notions set loose from one another. As nature has bound bodies and properties together by the ties of creative energy, so verbs bind them together in human thought and confidence.

The distinctions of names into individual or general, concrete or abstract, positive or negative, absolute or relative, do not so uniformly apply to verbs. Verbs can scarcely be individual to the extent of being proper names, like the names of persons among nouns; but they may have various degrees of generality. Thus 'burn' expresses a certain action; 'combine chemically' expresses a mere general and comprehensive action. The auxiliaries *have, do, shall, may*, may be reckoned verbs of a highly abstract nature. The most general or abstract of all verbs is the verb 'to exist,' or 'to be.' The distinction of positive and negative applies more directly to verbs than to nouns, inasmuch as these terms imply *affirmation*, which is the essence of the verb. Thus we have to make, to unmake; include, exclude; burn, quench; is, is not, &c. Verbs are absolute and relative when they correspond to absolute or relative nouns: thus when we make the noun 'father' a verb (to father), it is still a relative word.

Since all possible information or knowledge could be expressed by means of nouns and verbs, it has been supposed by many grammarians that these are the two

fundamental parts of speech, and that all the other parts mentioned in grammars—the adjective, pronoun, adverb, preposition, and conjunction—may be resolved either into nouns or into verbs, and actually grew out of them in the progress of human speech. Thus Horne Tooke pointed out the verbs which he conceived to be the originals of the words—*and, but, unless, that, &c.*; and it is generally admitted that his analysis was to a great extent very successful. But recent philologists, German and English, have decisively shown that the pronouns and the leading prepositions had an origin quite independent of any other class of words, and were not derived from either nouns or verbs. Although it is true that nouns and verbs may serve all the logical purposes of speech—that is, may suffice to express all kinds of truth, and all matters of knowledge and fact—yet the *dramatic* nature of speech demands something more. Language is in its very origin the system of forms observed between two intelligent beings when directing their common attention to some third object; and it must act so as to enable the one person to indicate to the other what and where is the thing to be attended to. It is impossible to divest human speech of this character of a threefold reference. It is only in the most advanced stages of the human reason that truth assumes a logical, to the exclusion of a dramatic shape, or that the personality of the speaker and the person spoken to is omitted from the forms of statement. ‘Do thou give me to eat’ is a genuine expression of primitive man. ‘The planets move in ellipses’ is an expression of the human understanding after ages of scientific and logical cultivation. Hence among the earliest terms of language are to be found words for denoting—*me*, the speaker; *thee*, or *you*, the person spoken to; and *him, her, it, or that*, the person or thing spoken of. The advance of ceremonial politeness, as well as of scientific cultivation, causes a departure from the most direct mode of representing self and addressing others: thus *I* passes often into *we* even for a single person, or into the indefinite pronoun *one*; and in writing, to the *writer, the author, or the undersigned*: and *thou* or *thee* passes into *you*, or is substituted by the proper name of the individual; and *you*, in a case of plurality, is converted into some generic name of the assembly—as men, brethren, countrymen, &c. In like manner the third person comes to be dismissed in favour of the actual name of the object, and is then employed only to save too many repetitions of this name. In consequence of these substitutions, and the throwing of the pronouns into a secondary position, it was not unnaturally supposed that names were invented first, and pronouns afterwards; but it is now ascertained that the contrary is the fact.

The celebrated German philologist Bopp, who was the first to discover the distinct origin of pronouns and prepositions derived from them, states that, ‘From the dissection of the pronouns, and of the prepositions connected with them, we get the following monosyllabic stems, partly consisting of a mere vowel, which either occur in Sanscrit only, or are found in the connected European languages with more or less exact correspondence in form—namely, *a, i, u, é; ha, hi, hu; na, ni, nu; ma, mi (-mu), mu; ya, yu; va, vi; ta, da, sa*. The compound pronouns—meaning thereby not derivatives like *lá-va*, “so much;” but primitives, which the grammarians consider as simple, but which we have endeavoured to reduce into their real elements—show as their first member in Sanscrit a stem consisting of a single vowel; they are the following—*a-va, i-va, é-va, a-na, é-na, a-da, i-da, é-ta, é-ha, é-sha*.’ Mr Donaldson,\* who has followed up and extended this discovery, maintains that the three distinct persons and positions essential to an actual dialogue are expressed in the Indo-European languages (which include Sanscrit, Persian, Greek, Latin, German, English, &c.)

by words that may be reduced to the three mute consonants, as their characteristic sounds, varied by the vocal, nasal, and aspirate forms of each: thus the labial *p* he ascribes to the first person, with its corresponding mute and vocal aspirate, which yield with a connected vowel, *ma, mi, mu, va, vi*. The guttural class of consonants he considers the originals of the second personal pronouns, giving *ha, hi, ya, yu, i, u*: and the dentals furnish the third person, or the remainder of Bopp’s roots, *ta, tu, ni, na*. It can be shown that these forms prevail in one or other of the languages of the Indo-European class, and are at the foundation of all the pronouns, and many of the prepositions and numerals, as well as of the inflecting syllables of nouns and verbs. As they are the most simple, they may be reckoned among the very first and most essential utterances of human speech: they are the earliest auxiliaries of inarticulate signs and gestures, and the first sounds that become significant and intelligible. Being in existence from the very beginning, they would be extensively mixed up and combined with the other classes of names—the nouns and verbs proper—and would give the means of varying these to suit variety of position, circumstances, and other particulars. The first person denoting *self* would be extended to mean *here*, as distinct from *there*, which would be marked by the third person; and the second person would be connected to denote something intermediate, *near here*, as distinct from both *here* and *there*. Such is the explanation given of the common origin of the pronouns and the prepositions of place—such as *to, from, near, &c.*

Nouns, verbs, and pronominal words, being considered thus the primitive classes of names, or the primary parts of speech, we have next to show how the other parts of speech, as well as the various kinds and inflections of the primitive words themselves, are formed from these. According to the usual classification, invented by the Greek grammarians, and adopted by the modern nations, the parts of speech are—the article, noun, adjective, pronoun, verb, participle, adverb, preposition, interjection, and conjunction.

But for our present purpose, it is more convenient to arrange the parts of speech according as they fall under the three great divisions—of pronominal words, nouns, and verbs. Under the first, Mr Donaldson classes personal and other pronouns, numerals, prepositions, negative and other particles; under the second, nouns, certain of the prepositions, and adjectives; under the third, verbs and all their tenses, moods, conjugations, auxiliaries, and participles.

1. The personal *pronouns* are the words, *I, me, we, us, thou, thee*, for the first and second persons; and *he, she, it*, for the third person, which are also what is called demonstrative pronouns. The oldest form of the first person in all the languages of the Indo-European stock is *me*, or an utterance whose essential part is the labial consonant *m*. This sound we must regard as the natural and primeval expression of our common progenitors for denoting one’s self; it is perhaps among the very first efforts of human speech, or one of the first sounds that was connected with a meaning. The nominative case of the pronoun *I*, used when an action begins with one’s self, as the cause or mover, is of secondary origin: when its forms, as seen in the Sanscrit and classical languages, are examined, they seem to show that it was formed out of the *m*, with certain additions. It is in Sanscrit, *aham*, which is resolved into three parts *a-ha-m*, each with separate force: the first *a* is supposed to be a form of the demonstrative pronoun, corresponding to our *that*; *ha* is a relative, like *who*, and *m*, the radical of *me*; the whole expression, therefore, is an emphatic *me, that which me, me* as distinguished from all other agents, movers, or causes of the act in question.

The plural *we*, when we ascend to its most primitive form in Sanscrit, is supposed to be resolvable into ‘*I and you here*,’ it is *va-ya-m*: *va* being one of the labial utterances of the first person; *ya*, a faint guttural, standing for the second person; and *m*, a first

\* See Donaldson’s *New Cratylus*, a very able and important philological work, from which the above exposition of pronominal roots, &c. has been chiefly derived.

personal root, meaning also the *here*. By a like analysis of the most primitive form of *us*, it has been supposed to mean *the here taken together*; in Sanscrit it is *asmán*: the *s* sound shows the presence of a primitive meaning which came to have the force of *together*, as in the preposition *syn*, *with*, which we find in many of our words obtained from the Greek; for example, *synthesis*, *synonymy*, *syntax*, &c.

A similar method is applied to show how the second personal pronoun, with its plural and cases, arose out of a primitive guttural consonant, which had the force of *thou* and *there*, but which in our language has become a dental vocal aspirate. The *r* sound, in our *there*, is also a primitive element of the Indo-European stock, and indicates motion: it is of great use in forming words of motion like *from*, *fro*, by combining with the sounds of mere position; *from* being like the Greek *para*, and being considered as made up of a labial, or first personal word, and a sound containing *r*, its literal meaning would be as we find it, *motion away from me or from here*.

The third personal pronoun, and the demonstrative element, or the thing by which the person speaking points out to the person addressed the subject that he is speaking of, is in Sanscrit *sa*; in Zend or ancient Persian, *hó*; in Greek, *ho*; in Gothic, *sa*; with us, *he*, *hit* (old form of *it*). Like the first and second persons it is a primitive utterance, and the source of various other words. It gives birth to the reflex pronoun *se*, *self*; *himself* being of the force of *him where you are*. The relative *who* appears likewise to be derived from it; and the turn of thought leading to the transition seems not unnatural. The Latin *quis*, *kui*, contains the most primitive sound of the second person—the mute guttural *k*. The interrogative pronoun *who*, *quis*, and the indefinite pronoun *any one*, which in Greek and Latin are the same as the interrogative, must also be supposed to spring from the same source.

The numerals have been shown to be derived in the first instance from the pronouns. The vulgar expression of 'number one,' meaning one's self, is the counterpart of the original derivation of *one* from the first personal pronoun, as is proved by examining the old languages. Another derivation of *one* has been traced from the word *moon* or *month*, as one of the divisions of the year; it being found that, besides the decimal notation derived from the fingers, there has also been used a duodecimal notation from the courses of the moon and sun. Number *two* is the second personal pronoun, *thou*. The third numeral has in all our tribe of languages the two consonants *t* and *r*: the first being the simplest root of the third personal pronoun, and the other the sound for motion away from: it is something like *it away there*. The *four* seems to have been a combination of the original forms for *one* and *three*. The only others of the ten numerals supposed to be formed from pronouns are *six*, *seven*, and *eight*: of these it is thought that the first has been originally formed of *three three*, and the second of *three four*. For *five* and *ten*, and their multiples, it has been proved that the same root as signifies the *hand* has been extensively employed; the only one of them where it appears in our language is *hundred*. *Ten* can be shown to come from *two hands*. The *nine* is a form cut down from *one less ten*, just as *eleven* has been *one more ten*.

The large numbers *thousand* and *million* seem to be names of vast aggregates. The Greek for *thousand* is derived from *chilos*, a heap of fodder; for ten thousand it is *myriad*, or a flood of water.

The ordinals *first*, *second*, *third*, &c. are derived from the cardinals in the early languages by means of a termination also used as the superlative termination of adjectives (in Greek, *tos*), meaning apparently the last of a series going on from the speaker.

The word *middle*, *medius*, is one of the many derivatives from the *me*, the *here*.

The prepositions have been analysed down to pronominal stems combined with one another, and with the syllable *ra*, signifying motion. Our *from*, *fro*, the

Latin and Greek *pro*, is an obvious instance of the combination, being a labial for the first person or the *here*, and an *r* for motion away from. In the classical tongues and Sanscrit, a like analysis has been made of the others. Thus *me-ta*, *here-there*, expresses *with*, and also close succession and change. One preposition in Greek, *dia*, in English *through*, is derived from the second numeral *two*, which gives it its meaning of division into two parts.

Of the parts of speech called *particles*, the most prominent is the negative *no*, *not*. The consonant *n* is the chief sound of this negative through all the Indo-European tongues; and it is supposed to be a strong form of the third personal pronoun, an emphatic *there*, in contrast with *here*, or an expression of *not here*. *Yes* is a form of the second personal pronoun. The disjunctive *or* is derived from the expression of removal or separation belonging to the *r* sound.

II. Under the head of the *noun* we include also the adjective. In both we have a system of genders, cases, and numbers; and in the adjective the comparative and superlative degrees.

III. The *verb* presents the varieties of persons, numbers (singular and plural), tenses, moods, voices, and conjugations.

Both nouns and verbs are compound words—that is, any word coming under either of them may be divided into two parts: one is called the *root*, and the other is an addition to it before or after. The root may be supposed to express the naked thing for which the word stands; the additions are for the purpose of expressing circumstances regarding it, such as may attach to it in common with any other object. By these additions the cases and numbers of nouns are formed, and the tenses, &c. of verbs. Thus if the English word *pure* were supposed to be a root, the words formed by adding syllables to it—such as *purity*, *purification*, *impure*, *purest*—would present examples of the addition of new general meanings to the original idea; that is, meanings that may be added to a great number of different primitive ideas; for the same terminations *ty*, *fication*, *est*, and the prefix *im* or *in*, may qualify adjectives at large. One of these terminations, *fication* (itself a compound), is seen at first sight to come direct from a word that can act a separate part—namely, the Latin verb for 'to make,' seen in *faction*, *fact*. The English word *make* is used in exactly the same way, as in *merry-making* (compared with *jollification*).

This example will show the nature of inflected words, such as the cases of nouns and the tenses of verbs. These are made up by adding to the root one or more syllables, which are themselves significant names, although often cut down, for the sake of rapid and easy pronunciation, so as to become difficult to be identified or traced to their original. Where the original was a syllable of several letters, the inflected syllable of the compound may be only a single letter, or may disappear altogether, while leaving its meaning behind it.

The Greek, Latin, and Sanscrit languages were inflected to a very surprising degree. For 'they might have written,' the Latin can say in one word, *scripsissent*, which is a coagulation or conglomeration of words expressing four ideas, each having a separate word in English. It is still possible to trace each of them, notwithstanding the shortening and other changes that have taken place. The bare root, or word for 'write' in the abstract, is *scrib*; all the rest of the letters are employed in giving the circumstances of conditionality, past time, and action, by a plurality of persons.

The *noun* in English has only three cases, and of these the nominative and objective are spelt the same. The possessive is formed by an inflection containing the letter *s*. The plurals are in great part formed by adding a syllable, also marked by the presence of *s*. In the Greek language there are five cases, in Latin six, in Sanscrit eight; that is, besides being inflected to signify possession, a noun in these languages is inflected to signify other relations, such as those we denote by our prepositions *to*, *by*, *with*, *from*, &c. If

we take the Latin noun *homo*, a man, we shall find it to be declined thus—

<i>Singular.</i>		
Nominative,	<i>homo,</i>	a man (as in 'a man goes').
Genitive or Possessive,	<i>hominis,</i>	of or belonging to a man.
Dative,	<i>hominī,</i>	to a man.
Accusative,	<i>hominem,</i>	a man (as in 'I saw a man').
Vocative,	<i>homo,</i>	man (used in calling out to a person).
Ablative,	<i>hominē,</i>	by, with, or from a man.

Now grammarians have been able to show what the words are that have most likely been added to, and fused with, the roots of nouns, to make these different cases. For example, the accusative is supposed to be formed by the locative particle, whose characteristic letter is *m*, signifying in a place, or placed, fixed, situated, which is itself of pronominal origin. The dative is supposed to be filled up by the addition of an ending signifying *in* or *on*, and the ablative by a word derived from the second personal pronoun (the thou, or near here) with motion, so as to come to mean away from; the genitive or possessive is considered as merely another form of the ablative, and made up on a similar idea. In the Indo-Germanic tongues, the *s* is a prevailing letter in the genitive termination, as we see in English. The plurals, which are also frequently in *s*, have not been very distinctly accounted for. With respect to the genders, which affect both nouns and adjectives—and in the classical languages have each a separate termination—it is supposed that the neuter is merely a diminution of the masculine, whereas the feminine is formed by a separate addition, which in Sanscrit is the long *i* sound, mostly changed in Greek and Latin to *a* and *e*. The terminations of the masculine and neuter are apt to be short, while the feminine is long. *Bonus, bona, bonum*, are the masculine, feminine, and neuter of the Latin adjective for good; *bonum*, the nominative and accusative of the neuter, is the accusative of the masculine.

The adjective is merely a form of the noun, expressing in a somewhat abstract way the class peculiarity of the things designated by the noun. A noun, if not an individual or proper name, is the name of a class of objects that have some common features—as *man, lion, water*; that is to say, there are certain constant peculiarities attached to each object that we name—a man, a lion, water; and when we wish to speak of the peculiarities by themselves, we alter the form of the noun, or use it without alteration to signify these: thus *manlike, human*, express simply the attributes of man, and not the object—man. These words are in the form that may be used in predication or affirmation, as when we say 'forgiveness of injuries is manlike,' or that 'such a one is lionlike.' This class of names is what we call adjectives: they qualify nouns, or help nouns to make out a desired meaning—as 'fair hair;' and they make the predicates of propositions. But a great number of adjectives are derived not from nouns, but from verbs, or from the words expressly adapted for making affirmations or propositions: thus *just* is from the Latin verb to order; *right* from the verb *rego*, to rule; *left* is from the verb to leave. These adjectives are of the kind called participles, and are reckoned a part of the verbs they come from, being one of the regular products of the verb, which in all languages makes provision for supplying one or more adjectives having its meaning, and capable of qualifying nouns. We say, 'he has given me a torn book,' where the word *torn*, derived from a verb, seems merely to assist in defining the character of an object that we wish to express. So 'a ruined man,' 'a fallen house,' 'a broken limb.'

Adjectives in qualifying substantives, in the inflected languages, become masculine, feminine, or neuter to harmonise with the gender of the substantive. This is still seen in French: in English it is unknown.

The comparison of adjectives is one of the earliest products of language. In the Indo-European languages the letters *tr*, one or both, are almost the invariable consonants of the comparative degree; they may be

derived from *ta* and *ra*, the third personal pronoun, and the particle of motion, as if implying one thing farther off than another. The superlative in its oldest form is *ta-ma*, the third and first personal pronouns, interpreted to mean the last in a series; in Greek it is *tos*, in Latin *tus*, in English *st*.

We have already described the intrinsic character of the verb. We must now endeavour to show how its various parts are built up by such additions to the root as serve to express all the differences of person, number, time, condition, and action, which may attach to any one verb.

The person endings of the verb, or the syllables for expressing *I, thou, he*, singular, plural, and dual, have been done away with in modern languages, if indeed they were ever used in all of them, and in their stead the actual pronouns are used. We say, 'I give,' when the Greeks would have said *didomi*; and for the other persons a single word expresses verb and person in Sanscrit, Greek, and Latin. On examining the syllables which distinguish the persons, it is found that they are the three personal pronouns in their original form as used in the objective case: in their oldest shape they are the syllables *mī, si, ti*: *dido-mī*, I give; *dido-si*, thou givest; *dido-ti*, he gives. Great modifications and abridgments came to be made on these primary forms, but they still continued to be traceable. Thus in Latin, *m, s, t*, are the ending letters of the three persons singular in most of the tenses of the active verb *dabam, dabas, dabat*—*I, thou, he, was giving*. The tenses of the passive voice—as *didomi*, I am given—are supposed by some to have had originally for their terminating syllables a stronger form of the same pronominal syllable as makes the endings in the active voice: the *mai* may be an abridgment of *mami* or *mama*, a doubling or more intense expression of the *ma*. The oldest form of the ending of the first person plural is *mes*, which may be regarded as made up of *me* and *se*, the first and second pronouns, or 'I and you,' which is not an improbable derivation of the expression for *we*. In the passive voice this person contains in Greek a *th* sound (*methon*), which is thought to belong to a locative particle, or a particle of place, and to furnish some contribution to the passive meaning—that is, the meaning of being acted upon, or being fixed in a position, and therefore passive, or capable only of being exposed or subjected to action. This idea of adding a locative particle to make the passive voice generally, is a supposition thought to be confirmed by the use of the letter *r* to make the passive tenses of the Latin verb. The second person dual and plural in Sanscrit and Greek is evidently derived from a repetition of one of the forms of the second person singular. In the third person plural termination, a syllable equivalent to *they* has been traced through several languages.

Next to the formation of the persons is the making of tenses, or forms of the verb, to signify the varieties of time and action. An act may be considered, and requires to be expressed, as present, past, or future; as complete or incomplete; as momentary or continued; and all these properties are expressed in the inflected languages by syllables added to the naked root. Mr Donaldson has shown that, in the Greek, continuance is denoted by a reduplication of the chief syllable of the root. Thus *do* is the root of 'give;' and the present tense, meaning 'I am now continuously giving,' is *didomi*; and the perfect, 'I have been giving up to the present time,' contains the same repetition, *dedoka*. For past time the letter *e* is prefixed to the verb, a particle signifying what is remote or at a distance. For future time the letter *s* of the second pronominal element is mostly what is used, and may be interpreted 'the near,' or 'the coming.' The position of the particle of past time at the beginning, and of the particle of future time at the end of the root, serves to assist each in pointing out the direction that it has to express; the prefix is most proper for the past, the suffix for the future. The future, the indefinite past (as I gave), and the perfect, have all for their terminations some

form of the second personal pronominal word. In French, an indefinite past tense is regularly derived from the future—as *lirais*, from *lirai*.

In English, the system of inflecting is very limited, and must have been so always. There is only one tense inflection, and that is for converting the present into the indefinite past; or we may say that an English verb has only two tenses; all the other varieties of time and mood being made up by the auxiliary verbs *do*, *have*, *will*, *shall*, *can*, *may*. There are two different ways of forming the past tense from the present—one by adding the syllable *ed*, which often passes into a *t* sound; the other by a change in the internal vowel of the verb. The first is the simplest, and is called the weak declension; the other is called the strong declension. The use of *ed* must be explained on the principles already illustrated in the Greek verb: it is a significant syllable, implying some such idea as distance, or a thing done and departed. It may spring from the same original root as our words *there* and *thou*, which are characterised by the aspirated *d*. The other change, as in *come*, *came*, *speak*, *spoke*, *fall*, *fell*, is more difficult to trace to its first origin: it is analogous to the style of inflection in the Hebrew language as distinguished from the system of the Latin, Greek, and Sanscrit; which last proceeds by adding syllables, as in the case of the *ed*. There must no doubt be something natural in altering the stress and direction of the voice, as by changing from a short vowel to a longer, or from a weak to a strong, when we wish to distinguish a thing past and gone from an act now going on; and although the impulse which leads to internal inflection is different from the one leading to external inflection, being more emphatic and determined, it is still a genuine and not inexplicable impulse of the human mind. The past termination *d* is common to all the Gothic languages.

The various moods of the verb—the subjunctive, optative, imperative, and infinitive—require and admit of explanations of the same tenor as the tenses, especially in the inflected tongues. Our own language, which forms the subjunctive and potential moods by auxiliaries, shows the connection of these with the tenses of the indicative: thus from ‘I shall go,’ or the future, we have ‘I should go’ of the conditional or subjunctive mood. The imperative mood is generally a very naked form of the verb—that is to say, it contains the root with a very weak addition when there is any at all. The infinitive is the form suited to the grammatical use of the verb as a noun; the participle is the form of the verb that acts the part of an adjective. The infinitive, in our language, *to do*, *to come*, expresses the mere state of action without circumstance of any kind; the participle expresses the state of action without reference to person, but with the other circumstances that would be expressed by a tense, such as time present or past, action finished or unfinished. In English, there is only one inflected participle, which ends in *ing*. It corresponds in time and action to the present tense: *I come* and *coming* are the same in these two respects. A past participle active is formed by the auxiliary *having*, and the past tense *came*; a past participle passive by *being*, and the same past tense. In Greek, there are numerous participles and infinitives both; the infinitives being varied to suit time and action. The English participial termination *ing* is said by Richardson to be formed by the Anglo-Saxon infinitive *an*, and the termination *ig*, which is reckoned of the same primary meaning as the past termination *ed*; in other words, the participle or adjective form of the verb arose out of the infinitive or noun form.

The *adverb* is a form of the adjective, used in qualifying verbs as the adjective qualifies nouns—as ‘he fought bravely.’ The termination *ly* is the word *like*. Verbs not being susceptible of masculine, feminine, and neuter forms, as in the case of nouns, adverbs cannot have the same inflections of gender as adjectives, neither can they have the case inflections. They are mostly derived from adjectives; but some of them, as

*now*, *then*, *here*, *there*, must be reckoned of pronominal origin.

The *prepositions* have already been alluded to as the immediate offshoots of the pronouns. In English, they are *in*, *on*, *of*, *at*, *up*, *by*, *to*, *for*, *from*, *till*, *with*, *through*, &c. They can all be traced to a few simple relations of position, such as we have seen in describing the primary pronominal situations.

The *conjunctions* were successfully identified by Horne Tooke with the imperatives of verbs: *and* is *add*; *if*, *give*; *yet*, *get*; *though*, from *allow*; *but*, *be out*, &c.

*Interjections* can scarcely be called parts of speech: they are not the names of objects, nor are they used for giving information about anything. They are mere isolated exclamations, like the howl of a dog, or the song of a bird, inspired by some present feeling or sensation, but not subject to the laws of articulate speech. Some forms of them are derived from regular names of objects, such as the various forms of interjunctory oaths and asseverations.

#### ORIGIN AND PROGRESS OF LANGUAGE IN GENERAL.

Having discussed the various classes of words called parts of speech, and shown that there are certain of them that give birth to all the others, we have now to consider the actual process of the invention, and gradual improvement of language as a whole. The first beginnings of human civilisation are necessarily very obscure, from their being anterior to history, and unlike any experience that we now possess. This is almost as true of every other department as of language. The first use of tools, the origin of the forms and ceremonies of social intercourse and religious worship, the commencement of the fine arts—of music, dancing, painting, sculpture, architecture, &c., the primitive organisation of human society, the beginnings of scientific speculation and knowledge, are all exceedingly dark and doubtful. We can but dimly imagine how humanity made the first step in any great walk of human life; and yet we have experience enough of the inventive genius of man, to know that all that has been done is within the range of its powers.

It has been usual to call language a thing of purely divine origin, proceeding as directly from the Creator of the world as the being of man himself. This opinion has been sought to be supported partly by a peculiar mode of interpreting the Mosaic account of the creation, and partly by the supposed incapability of mere human genius to give birth to such a wonderful structure. But this view cannot be maintained without endless perplexities and assumptions. We cannot show that the difference between language and other inventions is so great that the one surpasses, while the other comes within, the powers of the human mind; and so much of language can be shown to be the result of man’s own agency, that it is impossible to draw any line between what he received by inspiration and what he formed by art. At all events, if the origin and progress of language is to be subject of investigation and inquiry, like the history of any other branch of civilisation, we must proceed on the principle, as put by Chevalier Bunsen, that ‘in philology, as in geology, no forces are to be assumed but such as are still known to operate.’ If this is not granted in reference to any subject, it is put beyond the bounds of the human intellect. We must endeavour to determine how far the inventive capacity of man, so wonderfully exhibited within the periods authentically known, and from its very nature equally strong at all stages of civilisation, may have sufficed to originate the machinery and institutions that preceded the dawn of recorded history. It must be distinctly kept in view that the ancestors of the civilised races were not savages in the same sense as the Africans, New Zealanders, or Red Indians, who must be regarded as the imbeciles of the human family: they were men of the same natural capacity as their own descendants, and produced, every now and then, superior geniuses in all departments of life, and by these they were initiated into all the works of improve-

ment that they handed down to their posterity. Original genius is most powerful and fresh in the infancy of the world. When a great deal has been once established, the necessity of creation is less felt, and the force of routine is opposed to innovations. But an inventive mind, in circumstances where everything has to be done, works without check or obstruction from existing interests, and puts forth its highest powers with full effect. The invention of a vocabulary of words is not a thing utterly unknown to modern men. The technical names of trades and crafts are the invention of the workmen, and are often as independently created or invented as the very earliest words of human speech. No one will venture to say that the slang of thieves is of divine origin, and yet a great part of it is wholly undervalued from the language of common society, and purely the invention of the profession itself, or rather of that class of original minds in the profession whose genius lies in the way of expression. We must therefore endeavour to account, on the principles of human nature, for the invention of words, and their combinations; or we must show how it is possible that the thing could have been done, and confirm our explanation by what is actually found in the languages with the origin of which we are acquainted.

I. In the first place, the principle of imitation can account for the invention of a certain number of words; especially such as are the names of sounds, or of things that have some sonorous accompaniment or effect. Thus *cuckoo* is a palpable imitation of the cry of the bird. *Buzz, whizz, crack, clap, hiss, murmur*, are also produced by the force of direct imitation. All men have this faculty, and some men have it in a very high degree: and it is possible to produce by the human voice an articulate sound similar to, or in imitation of, the greater number of natural sounds. A single man of fine ear and delicate organisation—such a man as we commonly find in a good speaker or actor—could furnish imitative articulations for sounds to any extent that might be required; and we can have little doubt that the existing imitative sounds were first suggested by such more than ordinarily-gifted men. It is not every one that could create such imitations as *crack, buzz, hiss, rumble, &c.*; but every tribe among the superior races would now and then produce an individual capable of the effort.

The names of the parts connected with the articulating organs themselves would be formed by sounds associated with those parts. Thus it might be expected that to express the *lips* and *mouth*, *labial* letters would be chosen; to express the *teeth*, we ought to find a *dental* sound; and for the *throat* something *guttural*, as appears from the fact in all these instances. So the words *gape, yawn, chew*, are most obviously formed by articulations as nearly as possible coinciding with the actions that they describe.

II. It is only a very limited class of objects, however, that give forth an imitable sound, such as to suggest their articulate designation or name. The sun, the stars, the sky, the earth, the mountains, rocks, trees, and flowers, are distinguished by expressive silence rather than by audible accompaniments. This, however, only leads us a step farther into the powers and capacities of the human mind. Mere imitation, as when we mimic the cry of an animal, or chalk out the resemblance of a visible thing, or carve a fac-simile of any material object, is but an inferior effort of the human powers, although it is the utmost that some races are capable of. There is, over and above this faculty, a deeper and grander power, which is vaguely represented by such terms as creative art, artistic genius, the capacity of making harmonies, and many other phrases, which signify that there is such a thing as a common effect upon the intellectual and artistic faculties of man, by objects that are very different to the outward sense, and that the human mind has the power of recognising and of producing such harmonious concords of the unlike. Sound and motion are very different sensations, and yet it is well known that a set of sounds can

harmonise with, and coincide with the effect of, a set of motions on the mind, as we see in march and dance music. So there are strains of music that suit each different kind of outward spectacle or scenery; the impressions of sight and sound, however different on their first entrance through their respective senses, may have a closely-agreeing or harmonious effect on the inward mind. So it is with all the senses; there is scarcely an impression made on any one of them that would not be suited or harmonised by some one impression on every other. The finer the organisation of the mind, the more keenly alive it is to such harmonies, and to their contradictions or to discords.

But man can not only feel these harmonies of things sensibly unlike, he can also create them; at least some men, who are gifted above their fellows, are able to do so. An artistic genius can make objects of a totally different outward form and character agree in producing a harmonious feeling. They may be things of the same sense, as the parts of a temple, or the objects of a picture; or they may be objects of different senses, as when music is composed for marching, dancing, or stage spectacle; or when words are used to celebrate actions, events, and natural grandeur. Present any visible object to an artist of genius, and he will, according to the turn of his genius, either find another visible thing to chime in with it into a beautiful whole, or utter a sound that is felt to accord with its impression on the mind. Suiting the sound to the sense, the word to the action, is well known to be one of the characteristics of the poetic faculty. The following stanza from Keats's 'Ode to the Nightingale,' exhibits this quality in a degree that has probably never been surpassed. The language descriptive of each object is felt almost to realise the object itself—

' Oh for a draught of vintage, that hath been  
Cooled a long age in the deep-delved earth,  
Tasting of Flora and the country green,  
Dance, and Provençal song, and sunburnt mirth!  
Oh for a beaker full of the warm south,  
Full of the true, the blushful Hippocrene,  
With beaded bubbles winking at the brim,  
And purple-stained mouth;  
That I might drink and leave the world unseen,  
And with thee fade away into the forest dim.'

Now there is no difference between efforts of human genius such as this, and the invention of the first sounds used in connection with nameable objects; except that in the one articulations already formed are made use of to make new combinations, whereas, in the other, the articulations themselves are struck out for the first time. But this makes no difference in the nature of the effort itself. All our poetic geniuses could create original words at pleasure, if that were still necessary and allowable; and in fact they occasionally do so. Any one acquainted with the works of Burns will remember many such instances, which it is not necessary to quote here; and it will be easily seen that it was quite within the range of the poet's genius, and was even a tendency that it had to deal more largely in this kind of creation. If Burns had been produced among some of the weak-minded African tribes, he would have given them not merely a new poetry, but a new and expressive vocabulary; and would have been delighted with an opportunity so congenial to his faculties. The same remarks might be applied to Chaucer, Shakspeare, Keats, or any other poet whose genius lay strongly in power of diction.

What we assert, therefore, is, that the words not derived by direct imitation could have been formed by the genius of man through the deeper harmonies of things, and through the power of creating such harmonies. Moreover, it can be shown that every language does tend to harmonise with the things expressed by it, and did so perhaps still more at an early period of its growth. For it must also be taken into account, that when a name has a felt harmony, or mental coincidence with the thing, it is easily retained in the

memory, and easily diffused and caught by the various individuals of a society; in fact, every such name is a stroke of art, received and relished as such, as well as being a handle to an object, and useful in social intercourse. It would be impossible, by any power ever exercised over a multitude of men, to get them to adopt a set of insipid, inexpressive, or discordant vocables; and it would be equally impossible for human nature to produce them; nor can it be supposed that the Creator, granting Him to have been the direct author of speech, would have inspired such a species of sounds; it is more likely that He would have surpassed the genius of man, and made our languages more harmonious than we find them, which they could very well afford to be. The highest genius being but rare in all ages, this work must often have been done, or left undone, by an inferior order of minds.

It will not require many examples to show how deeply the principle of harmony enters into the vocables of speech. The 'ohoi' of sailors is a familiar instance of an articulate accompaniment to an action, and prepares us to expect that the current name of it and similar actions should contain the same sound, as we actually find in 'hoist,' 'heave,' 'haul,' 'hurl,' 'hurry,' 'high,' and in 'head,' if this be derived, as Horne Tooke suggests, from 'heaved.' The Scotch words 'sich' (sigh), and 'pech' (pant), show the same suiting of the word to the action. The words 'bound,' 'burst,' 'quick,' are obviously suggested by the character of the movements they apply to; 'strength' and 'stress' are the natural accompaniments of strong exertion, like the 'ohoi.' The word 'vast' is an expression of the speaking organs suited to the effect of a certain kind of spectacle on the organs of sight. 'Rough' and 'smooth' are the harmonies of peculiar sensations of touch; 'smack' is a word accompanying a peculiar flavour or relish. The word 'fresh' has a very strong coincidence of effect with the quality which it represents. 'Raw' is also a very expressive utterance for one of our sensations. The *r* sound, from its vibrating character, is the natural expression of any effect that causes a shivering or tremor of the flesh.

Many more examples of the same kind will suggest themselves to the reader. We have been able to give but a very limited illustration of such a wide ranging principle. It might be shown, in addition, how every emotion of the mind which objects can produce inspires an appropriate articulate harmony.

Mr Richardson, the author of the English Dictionary, has made an ingenious attempt to connect a few of the letters of the alphabet with extensive classes of allied meanings. Thus the labial sounds *b, m, v, f,* are the first uttered by children, and enter largely into the terms for the parental relations, and into the expression of life, mind, motion, &c. Thus we have *father, mother, filial, babe, boy, mind, motion, vital.* So he finds in the gutturals *g, k,* the notion of *eke,* or *increase*; in the *n, one, union, unite,* and the general idea of these. *R* is much connected with the expression of motion, and frequently gives the force of *before*; *ss* has a wide application as a disjunctive syllable.

Having illustrated the origin of sounds by imitation and harmonious creation, we have next to trace the extension of these primary sounds by the force of the associating principles of the human intellect. The two fundamental laws of association are expressed by the terms contiguity and similarity, and both are of extensive operation in the growth of language.

III. When two things frequently accompany one another in our view, the one comes to be able to suggest the other. The name of a person may be formed by the creative faculty direct, or it may be the name of some adjunct inseparably connected or associated with him, as his territory or land, his office, or some of his deeds or attributes. In this last case there may be no essential harmony between the sound and the aspect of the person. Many objects are named by contiguity in this way: churches are named from saints, and parishes and villages from churches. Towns are named from

wells, rivers, mountains, or other adjoining objects that have been able to originate a name for themselves. Objects discovered for the first time are called after their discoverers; effects are named from their causes; and causes from their effects. Rhetoricians have an express designation for this process of naming: it is said to be by *metonymy*, or by *acompaniment*.

IV. Equally extensive is the operation of *similarity*, or the extension of a name from one thing to another resembling it; which will in some cases tend to preserve the harmonious character of the original name. Thus the word *mouth* is applied to a great number of objects that are supposed to have the character of an opening: so *yawn* is extended to outward things, analogous to the original action. The whole range of what is called *metaphorical terms*, of which every language is full, are formed on the same principle.

V. Sometimes names are constructed out of several words or syllables taken from different objects, it being necessary in some cases to apply the names of several qualities to describe what is meant; as when we say, 'a coat of many colours,' 'black beetle,' 'moss roe,' 'steamboat.' The commonest case of construction is when a noun is qualified by an adjective, as 'green fields;' in the systematic naming of objects of natural history this combination is adopted. Another extensively used instance is the addition of qualifying terminations to words—*good-ness, god-like* or *godly, flaming.* The class of inflected words already alluded to exemplify the same principle: they result from the desire of the human mind to give a unity to each compound name, and for that purpose to fuse the syllables into one continued utterance. The creation of compound names is a work of human genius not unlike any other effort of constructive combination.

It has been repeatedly shown by writers on language, that individual and concrete names are the first invented, and that general and abstract names are subsequently formed out of them. There is a word invented for some one river before there is a general name for rivers; and the term for some particular white object would be likely to give the abstract terms *white,* and *whiteness.* We see this still exemplified in a few of the names of colours—as 'claret,' 'orange,' 'sky-blue.' The very abstract property of 'electricity' is named from amber, one of the first objects that the property was observed on. 'Geometry' is the measuring of land, to which particular case the science was originally applied.

With respect to the formation and growth of the several parts of speech, we have already seen that nouns, verbs, and pronominal words, are the original stems, and that all the others are derived from these. The pronominal words are the direct suggestions of the human faculties in the circumstances that they express. The nouns and verbs are the names of objects at large; and it would happen sometimes that the first name that an object suggests is a verb, and at other times it would be a noun. Verbs express action, and, as such, they are most in harmony with the articulate expression of man, which is itself an action. In fact, when a thing perfectly lifeless and motionless suggests a harmonising utterance, it must be in consequence of some secondary impression that it produces, relative to motion or force, such as the effect of a heavy mass, a confined cavity, or an open space. Perhaps in the greater number of cases a verb is the first form of the word, which is subsequently turned into a noun. Thus the word 'stamp' is evidently the harmonic of an action, and is primitively a verb; being afterwards used as a noun to express the thing left or produced by the action. It has been remarked that many of the roots of the Hebrew language are impersonal verbs, or verbs that express merely the action without the person or object, like our verbs, 'it rains,' 'it mows.' The imperative mood of the verb is generally the least inflected, and it may be supposed that some of the earliest expressions of action would be in the form of command. But with respect to the derivation of nouns from verbs,

Horne Tooke has pointed out a great number of cases in English where the past participles of verbs are converted into nouns; and many of those so derived are among the most important in the language. Thus *faint, gift, joint, drift, theft, want, draught, rent, malt, stern, heaven, dawn, yarn*, are all of this character; and it is easy to see that the objects they express are, or are supposed to be, the results of the actions designated by the verbs they proceed from. On the other hand, there are undoubtedly many cases where the noun has been the primitive form, and has given birth to a verb; a process we still see exemplified, as when we speak of *labling, flooring, housing, &c.* The association of ideas is very obvious in these instances.

Of the formation of the other parts of speech, together with the inflections of verbs and nouns, we have already spoken. The laws of the human intellect can fully explain the tendency to make inflected or compound words; that is to say, the process is one of the well-known operations of the human mind. We frequently require to construct an object that will have many qualities, or serve many purposes: every machine, every plan of complicated operations, every discourse, is such a construction. When we wish to express an idea that has many particulars, we seize a number of separate names, and join them together in the best way we can, or according to our taste, so as at once to include what we mean to affirm, and exclude what is foreign to the purpose. We may at the same time desire brevity of utterance, and in that case we fuse and contract the separate words as much as possible; we may wish for melody or fine cadence, and as our ability serves us, we impress this character on the combination. Different peoples have had different fancies and very unequal capacities in respect to this constructive operation. Some, like the Chinese, have not been able to combine elementary words into perfect compounds that sound as flowingly as a single syllable; while the Greeks and their ancestors could do so to the utmost perfection. Our own language is about midway between the Chinese and the Sanscrit, or between the system of the eternal separation of roots, and the system of harmonious aggregation into inflected words carrying multiple meanings.

Inflected languages, if the inflections are subject to the laws of harmonious utterance (which in many cases they are not), serve the purposes of oratory and poetry in a very high degree. Uninflected languages may have the superiority as the medium of prosaic communication and scientific analysis, if they are well formed in certain other respects.

Sentences or successions of words naturally follow the order of the things to be expressed: if they relate to events, it will be in the order of time; if actions, the order of cause and effect. But the natural order may be reversed from the feelings of the speaker, or from a wish to make a certain musical effect on the language, in addition to the communication of the thought.

The progress and development of a language are influenced by many causes. Besides enlarging the basis by inventing new words, and extending the applications of the old, there is a constant tendency to abbreviation which goes on modifying the original sounds. A people's language is expanded by their discoveries in the material or mental world, and by their advance in science, arts, and civilisation in general. It is also made an object of express cultivation for its own sake in all improving nations, and is controlled by artistic genius, and by artificial laws of pronunciation, grammar, rhetoric, and criticism. The love of novelty will cause innovations, and produce fashions in speech as in other matters; but being a thing impressed upon the minds of men at their most susceptible season, and being intensely riveted by daily use, it comes to be among the most permanent of human acquisitions.

Language is also exposed to many changes and modifications by the intercourse of different nations. This cause has sometimes gone so far as to suppress one language almost entirely, and to substitute a foreign

tongue in its stead. But the amount of this influence may be more or less, and it has been exemplified in many different degrees in the history of the world. If one nation merely trades with another at some distance, it will import, with the foreign commodities, the names that are given them by the other nation; if the opportunity of intercourse leads to the exchange of customs, ideas, and institutions in general, the names of these may also be acquired, just as the French use many of the English phrases for the steam-engine. Colonisation in a country already peopled is a further step, and has a still greater influence; but the peculiar effect that takes place will depend on the characters of the two peoples. If the one is more intellectual and more advanced, more resolute and more wedded to its practices than the other, the language of the stronger will be likely to be imposed more or less on the weaker. But if the colonists are not accompanied by women, and are obliged to adopt wives from the inhabitants that they settle among, the next generation will have more of the language of their mothers than of their fathers, and a modified form of the aboriginal speech will be maintained. The same fact holds true of invasions and conquests like the Saxon and Norman settlements in England. On the other hand, in the German conquests of the Roman Empire in the fifth century, which were made by nations migrating in mass, the tongue of the invaders was more likely to be sustained. It would then depend upon the relative numbers of conquerors and conquered, and their relative energy, general superiority, and self-will, which of the languages should give way, and to what extent. In general, in every invasion, the portions of the conquered people's language which are most liable to alteration are the names of ranks, offices, forms of administration, and everything connected with the general government of the country. The spread of religion among a people affects their language along with their whole manner of thinking and feeling. The same obtains in a minor degree in any new sciences, arts, knowledge, doctrines, or institutions that may be communicated to a nation in anyway whatever. If conquest or intercourse change the character of a people, it will by that fact alone change their language. Any other circumstance modifying national character, such as emigration to new settlements, will have the same effect.

Among the circumstances which act in modifying the use of speech, none is more important than the art of writing. It would be interesting to imagine the origin and progress of written language, in the way we have endeavoured to explain the career of spoken language. We might, in so doing, show the action of the same laws of human nature in a different class of circumstances. Every people of superior character would, in addition to their spoken signs, create an independent class of written signs, which last would, in fact, in some respects be the easier effort of the two. Mere imitation, or picture-drawing, would suffice in this case, for there is no object but what has a visible form, or may be easily associated with such; and after the mechanical art of drawing has been once acquired, the means of indicating the objects of communication and thought would be unlimited. The weak point of picture-writing is seen in attempting the expression of action and chains of events; but this difficulty has not been found insuperable. Examples of successful picture-writing have been furnished by many nations—such as the Egyptians, Mexicans, and Chinese. The abbreviations that would necessarily be made for the sake of saving time would very much diminish the exactness of resemblance; but so long as the meaning was understood, this would be of little moment to the people themselves. This, however, renders it difficult now to trace each mark or symbol to its original imitative form; but not so much so as to obliterate altogether the evidence of the fact.

The invention of an alphabet is a totally distinct step from the formation of a picture language. It is a vast stride in advance, arising out of the simultaneous

use of both spoken and pictured signs for the same objects. To illustrate this process we shall imagine an instance of a familiar kind. Suppose the sound *bee* were adopted as the harmonic articulation, or spoken name of the insect so called with us; and suppose also that, quite independent of the spoken name, a pictured imitation had been formed of the same object, and abbreviated or simplified as much as was consistent with characteristic distinctness. The object would thus have two marks, one to the eye and one to the ear; and by the association of ideas, the two marks would be connected in peoples' minds, so that on seeing the picture they would be reminded of the sound, and on hearing the sound they would be reminded of the picture. Suppose, next, that some other object had acquired a name where the *b* sound occurred, without having yet acquired a pictorial representation. In such a case it would be very natural, instead of making a new drawing, to employ the one already corresponding to the sound in a well-known instance: this would not picture the object to the eye, but it would suggest its name to the ear, and be at least as effectual as the mention of the name in speech. If the word contained two characteristic sounds, as *bed*, and if the character for a *b* were joined with another character derived in the same way for the *d* sound, an alphabetic representation of *bed* would be the result. In the first stages of the alphabet, the vowels and consonants were not perfectly distinguished; each letter was a simple syllable, having the force of a vowel and consonant joined. This explanation of the origin of the alphabet is completely confirmed by the structure of the Hebrew letters, which are the originals of all the European alphabets.

The art of writing tends to fix a language, and erect for it a standard of grammar and spelling, by placing it under the control of the learned classes of a nation.

#### THE LANGUAGES OF THE GLOBE.

After expounding the essential *structure* of language, and the principles of the human mind that determine its origin and *growth*, the next object should be to enumerate and classify the actual languages of the human race, to specify their distinctive peculiarities, and to illustrate by means of them the general principles previously laid down. But, not to speak of the limits of this treatise, the complete examination of the languages of the globe is at present very far from being complete, and the analysis of such as are known is spread over many hundreds or thousands of volumes. We must be content, therefore, with stating the usual classification that has been adopted, with a few remarks on a limited number of individual tongues. The grand divisions correspond with the divisions of races and nations described under ETHNOLOGY.

#### Indo-European Languages.

The names *Indo-Germanic* and *Indo-European* are given to a class of languages that prevail from the East Indies, through the west of Asia, and across the whole of Europe to the Atlantic. They are also called *Iranian*, from *Iran*, the ancient name of Persia, and the name of the lesser of the two table-lands of Asia, nearly coinciding with the empire of the ancient Medes and Persians. This Persian table-land is supposed to have been the original seat of the Indian and European nations, from which they migrated and conquered, some eastward upon Hindoostan, others westward upon Europe, giving rise to the chief of the modern European nations.

These languages and nations have been divided into High and Low, from the supposed primitive geographical position of the different peoples. The high languages are believed to have sprung more immediately from the high land of Persia, and the low from the adjoining lower country of Media. The Classical, Germanic, and Celtic stocks of the tribe, are each divided into a high and low division; and there is found to be a closer analogy between the high and the low divisions respectively of each stock, than between a

high division of one and a low division of another. We shall first state the individuals of the tribe in a geographical order, and next indicate the high and low divisions:—

I. The *Sanscrit*, containing all the dialects of Hindoostan derived from the Sanscrit.

II. The *Persian*, ancient, middle, and modern; the ancient Persian, of which books still remain, is called the Zend, and is the language chiefly used in making comparisons with the ancient Sanscrit, Greek, Latin, and other tongues of the Indo-Germanic family. It includes the allied tongues of Curdistan, Afghanistan, Beloochistan, and Bocharia.

The Armenian and Georgian stocks have a geographical position adjoining the Persian, but their extent and importance are comparatively small. The *Ossetic*, a language spoken by an insulated tribe of Mount Caucasus, and a supposed remnant of the ancient Median, is Indo-European.

III. The *Classical*, embracing the Greek and Latin, and the tongues allied to these in ancient and modern times. The modern French, Italian, Spanish, and Portuguese, are derived from the Latin.

IV. The *Slavonic*, including the Russian, Polish, and Bohemian languages, and those of a great part of the countries in Europe subject to the Turkish empire—the Servians, Croatians, Transylvanians, &c.

V. The *Lithuanic* stock, including the Livonian (or Lettish) of Livonia and Courland, the old Prussian, and the Lithuanian of Lithuania.

VI. The *Gothic* or Germanic languages, including the Scandinavian branch, or the Norwegian, Swedish, Danish, Icelandic, and Feroic; and the Teutonic branch or the High German (whose ancient form is called the *Mæso-Gothic*), and the Low German tongues—namely, Dutch, Anglo-Saxon, and English.

VII. The *Celtic*, which has six different branches—the Cymric or Welsh, the Cornish (extinct), the Armoric, or dialect of Brittany in France, the Irish, Scotch Gaelic, and the Manx of the Isle of Man.

It is understood that in a historic point of view the so-called low languages are the oldest of the two; an opinion which contradicts many beliefs formerly prevailing, such as that Greek is a more ancient formation than Latin.

The high languages of the family are considered to be High Persian or Parsi, the Greek branch of the classic stock, the High German, and the first three Celtic tongues mentioned above—Welsh, Cornish, and Breton. The low languages are the Sanscrit, the Zend or Low Persian, Latin, Slavonian, Lithuanian, Low German, and Low Celtic or Irish, Scotch, and Manx. This classification is found to be supported by the closer analogy that exists throughout each class, than if no such distinction was made.

Other European languages not of this family are the Albanian, the Basque or Biscayan, the Turkish, the Maltese, the Calmuck of the Crimea, the Hungarian or Magyaric, the Ethonian, the Finnländic and Lapponic. It has been attempted to include all or most of these in another great family or tribe along with the Tartars of Central Asia.

The most interesting point in reference to the Indo-European languages, is the fact of their family resemblance. Considering the remoteness of the various peoples from one another, the very little intimacy that there has been among them, and the mutual unintelligibility of their spoken tongues, it is surprising to learn that there is at bottom a very close identity of words and forms between the most distant members of the family. We shall here present a short table of words running through all the languages, choosing such as are the names of the most prominent and indispensable objects of human speech. The following list is selected from Winning's 'Manual of Comparative Philology':—

*Father*.—Sanskrit, *pitar*; Zend, *patiar*; Persian, *pader*; Greek and Latin, *pater*; Slavonic, *bat*; Gothic, *fadrein*; Low German, *fader*; Old High German, *vatar*; Erse, *athair*.

*Mother*.—Scr. *matar*; Z. *matar*; Pers. *mader*; Greek, *meter*; Latin, *mater*; Lithuanian, *moter*; Lettish, *mate*; Old Prussian, *muti*; Germ. *muotar*, *mutter*, *moder*; Erse, *mathair*.

*Daughter*.—Scr. *duhitar*; Z. *dughdhar*; Pers. *dokhter*; Greek, *thugater*; Slav. *dochter*; Lith. *dukter*; O. Pr. *dukti*; Goth. *daughtar*; Germ. *tochter*; Erse, *dear*.

*Brother*.—Scr. *b'ratar*; Z. *bratar*; Pers. *brader*; Lat. *frater*; Greek, *fratra* (a fraternity); Slav. *brat'*; O. Pr. *brati*; Goth. *brothar*; Scandinavian, *brodur*; O. High German, *pruodar*; German, *bruder*; Erse, *brathair*; Welsh, *brawd*.

*God*.—Scr. *devas*; Z. *dēvas*; Pers. and Russ. *diw* (the evil spirit); Lith. *diewas*; Lett. *deews*; O. Pr. *deius*; Lat. *deus*; Greek, *theos*; Erse, *dia*; Welsh, *duw*; Scandinavian, *ty-r*.

*Eye*.—Scr. *ak'si*; Z. *as'i*; Lith. *akis*; O. Pr. *ackis*; Lett. *aze*; Slav. *oko*; Lat. *oculus*; Goth. *augo*; Germ. *oge*, *auge*; Dan. *oje*.

*Tooth*.—Scr. *dantas*; Pers. *dendan*; Lith. *dantis*; Gr. *odontes* (teeth); Lat. *dens*; Goth. *thuntus*; Dan. *tand*; O. Engl. *tain*; Erse, *dend*; Welsh, *dant*.

*Foot*.—Scr. *padas*; Z. *pad'as*; P. *pa*; Gr. Lat. *podes*, *pedes* (feet); Lith. *padas*; Lett. *pehda*; Goth. *fotus*; Germ. *fuss*.

*Sun*.—Scr. *hailis*; Gr. *helios*; Welsh, *haul*, *heol*; Lat. *sol*; Slav. *solnze*; Lith. *saule*; Lett. *ssaule*; Goth. *sunil*; Scand. *soel*; Erse, *saule*.

*Water*.—Scr. *uda*; Lat. *udus*, *unda*; Gr. *hudor*; Slav. *voda*; Lith. *vandu*; Lett. *udens*; O. Pr. *unds*; Scand. *udr*; Goth. *vato*; O. H. Germ. *wazar*; Germ. *wasser*; Erse, *dqr*; W. *dwr*.

*Light*.—Scr. *aloka*; Gr. *lukē*; Lat. *lux*, *lucis*; Slav. *luc'*; Lett. *lukotees* (to look around); Goth. *liuhath*; Germ. *licht*; W. *llwvej*; Erse, *leos*.

*Door*.—Scr. *dwarā*; P. *dar*; Slav. *dwer*; Lith. *durrys*; Lett. *durris*; Goth. *daura*; Germ. *thur*; Gr. *thura*; Erse, *doras*; W. *dor*.

*Ox, Cow*.—Scr. *go*, *gaus*; Z. *gaos*; P. *gau*; Sabine, *gaus*; Lett. *gows*; Erse, *geo*; Scand. *ku*; O. H. Germ. *chuo*; Germ. *kuh*; Gr. *bous*; Lat. *bos*; Slav. *buik*; W. *buw*.

*Worm*.—Scr. *kirmis*; P. *kirm*; Lith. *kirmele*; Lett. *zehrms*; Lat. *vermis*; Goth. *vaurns*; Scand. *orms*; Germ. *wurm*.

*Thin*.—Scr. *tanus*; P. *tenuk*; Gr. *tanus*; Lat. *tenuis*; Slav. *tanok*, *tanam*; Scand. *thunnr*, *tunn*; Germ. *dunn*; W. *denau*.

*New*.—Scr. *navah*; P. *nu*; Lat. *novus*; Gr. *neos*; Slav. *novii*; Lith. *naujas*; O. Pr. *nauns*; Goth. *nivis*; Germ. *neu*; Erse, *nuadh*; W. *newydd*.

*Red*.—Scr. *rud'ira*; Lat. *ruber*; Slav. *rdjti* (to reddens); Lith. *ruddas*; Scand. *rod*; Engl. *ruddy*, *rud*; Erse, *ruadh*; Gr. *eruthros*; O. H. Germ. *rot*; Germ. *roth*.

*First* (feminine singular).—Scr. *prat'ama*; Z. *frathema* and *paoriya*; Gr. *protā*; Lat. *prima*; Goth. *fruma*; Lith. *pirma*; O. Pr. *pirmoi*; Slav. *pervaja*.

*To know*.—Scr. *g'na*, *ganami*, *gnotas* (known); Gr. *ginosko*; Lat. *gnosko*, *gnarus*; Slav. *znati*; Lith. *zinoti*; Lett. *sinnat*; Goth. *kanu*, *I know*; O. H. Germ. *chnata*, *I knew*; Germ. *kennen*; Engl. *to ken*, *to know*; W. *gwn*, *I know*.

*Stand*.—Scr. *st'a*; Z. *histami*; Gr. *histēmi*; Pers. *astaden*; Slav. *stati*; Lith. *stoweti*; O. Pr. *staninti* (standing), *po-stat*; Goth. *standan*; O. H. Germ. *stantan*; Erse, *stadam*; W. *eistedh*. *to sit*.

*Bear*.—Scr. *b'ar*; Z. *baraiti*; P. *berden*; Goth. *bairan*; Saxon, *bearan*; O. H. G. *peran*; Erse, *bheirim*, *bearadh*; Gr. *phero*; Lat. *fero*.

*Eat*.—Scr. *ad*; Gr. *edo*; Lat. *edo*; Slav. *jadmi*; Lith. *edmi*; Lett. *ehmu*, *ehde*; O. Pr. *idia*, *food*; Goth. *itan*; O. H. G. *izan*; Germ. *essen*; Erse, *itheadh*; W. *ysu*.

*Be*.—Scr. *b'u*; Z. *bu*; P. *bu-den*, *to be*; Slav. *bu-ti*; Lith. *buti*; Lett. *but*; O. Pr. *bout*; Low Germ. *beon*, *to be*; O. H. Germ. *pim*, *I am*; Erse, *bhith*, *to be*, *bu mi*, *I was*; W. *bod*, *to be*; Greek, *fuo*; Lat. *fui*.

*Mind*.—Scr. *manyati*, *he thinks*, *manas*, *mind*; Z. *man*, *to think*, *mans*, *mind*; Gr. *mnaomi*, *I remember*, *think*; Lat. *mones*, *memini*, *mens*, *mind*; Slav. *mjeniti*,

*to think*, *po-mjanu*, *I remember*; Lith. *meneti*; Lett. *pee-minne*, *I admonish*; O. Pr. *po-miniana*, *thought*; Goth. *munan*; O. H. Germ. *manon*; Germ. *meinen*; Engl. *to mean*; W. *menw*, *mind*.

The amount of coincidence which may be thus observed in such primary and universal words through so many languages, is rendered still more striking and instructive by the discovery, that the differences in the same word observed between one language and another are subjected to regular laws. It was discovered by Grimm, that a regular interchange of consonants takes place between the words of the German languages, so that when we know how a word is spelt or pronounced in one, we can almost predict with certainty how it will be pronounced in another; so that, in fact, the different languages are in a great measure composed of the same words articulated in different ways. We have seen that the Sanscrit, Greek, and Latin, give as the word for *father*, *pitar*, *pater*, where the consonants are *p*, *t*, *r*; while in the Low German dialects or the Gothic, it is *fadrein*; the mute labial *p* being turned into the aspirate labial *f*, besides the change from the mute to the vocal dental, or from *t* to *d*. The Old High German has a still farther change of the same labial to the vocal aspirate *v*; in it the word is *vatar*. So we observe *tres*, *threeis*, *ari*; or dental mute, aspirate, vocal, in the Latin (as well as the Greek and Sanscrit), Low German, Old High German respectively. Again, when the Latin has a vocal for the characteristic letter of a word, as *d*, the Low German (including English) has a mute, thus *doem*, *ten*. The change from mute to aspirate is exemplified in the gutturals, in *cor*, *heart*. In the same way other changes might be exemplified of an equally uniform character. The discovery of such principles stamps a certainty upon the etymological tracing of words which could not otherwise be attained. It is not enough that one word in one language should sound very like a word in another language; they must differ according to the laws established between the two languages, and in no other way.

There are thus for each member of the Indo-European family certain general principles of the formation of words, which, though not without accidental deviations and exceptions, govern its mode of pronouncing such of the words as are common to the whole family. The determination of these laws, therefore, enables the vocabulary of one to be immediately applied to interpret the vocabulary of another. We shall cite a few more examples of pervading peculiarities attaching to individual tongues, in touching briefly upon the leading members of the family in succession.

The Sanscrit, which can be most immediately compared with the Greek, wants entirely the two vowels *e* and *o*, having only the three *a*, *i*, *u*, and certain vibratory vowel modifications of *r*. These three are the most strongly marked of the vowel utterances, and are therefore the primary vowels; the *e* and *o* being evolved from them at a subsequent stage. The Sanscrit has usually *a* where the Greek or Latin has *a*, *e*, or *o*, which gives an immense predominance to the *ah* sound in the Indian languages. The Sanscrit has also sometimes a guttural, which is transmuted in the classic languages, but remains in the Gothic, as *laghu*, *lux*, *leicht*, *light*. A somewhat unexpected change is occasionally made from *d* to *l*—as *dipa*, *lamp*.

The Zend language is remarkable for wanting the *l*, as the Chinese wants the *r*, and hence all its forms must be subject to this omission; but in modern Persian the letter is found. The *s* in Sanscrit is apt to be replaced by *h* in Zend—as *sā*, *hā*, *they*; *sapta*, *hapta*, *seven*; *sva*, *hva*, *his*. This corresponds to an interchange that is frequent between Latin and Greek—as *sus*, *hus*, a *swow*; and also between Gaelic and Welsh; and it is worth remembering that Latin, Sanscrit, and Gaelic are of the low division, while Zend, Greek, and Welsh are of the high division of languages. The Zend also differs from the Sanscrit in possessing the vowels *e* and *o*.

The comparison of the German languages among

themselves was the first occasion of bringing out these uniformities of interchange, and has completely established the existence of two distinct German stocks, having nearly the same vocabulary differently articulated; one of which, including the low dialects, is the older and softer of the two. Although the two stocks branch out into subordinate divisions, the characteristic difference of pronunciation follows them throughout. Thus where we say *day*, the High German says *tac*, *tag*; where we say *sleep*, they say *slafan*, *schlafan*. The Scandinavian tongues rank with Dutch, Flemish, Frisian, Anglo-Saxon, and our own language, among the low German class. Each of these tongues has its distinctive and assignable peculiarities of vocables and grammar, showing an independent growth subsequent to their separation from the parent stem, and doubtless determined by the characters and fortunes of the separate peoples. The only point touching on their connections or differences to which we can here allude, is that relating to Anglo-Saxon and English. It is customary to assert that Anglo-Saxon was the only Gothic language in this country prior to the Norman invasion; and that shortly after this event, it became transmuted into English, a language differing from it in some of the most durable peculiarities of grammatical structure. But when we consider the difficulty there would be in inducing a whole people accustomed to say, *to bear*, *to die*, &c. as the infinitive forms of the verb, to change to the form *bearan*, where the preposition is at the end, there being no assignable motive for making such a change, we may safely assert that no sufficient proof has hitherto been adduced that the opposite change took place within a century, and that a large class of other changes of a kind equally difficult and uncalled for was made within the same period. Hitherto, the growth of English out of Anglo-Saxon has been tacitly assumed as a thing hardly requiring any evidence farther than the affinity of the languages, and the known disappearance of one of them; the steps adequate to effect so stupendous a revolution in the habits of articulation over a large empire have never been suggested by any one.

In the English language there are computed to be about 53,000 words, of which 3820 are primitives; of these primitives, 2513 are common to English and the German tongues; and 1250 common to English and the classic tongues. This calculation will serve to show how far the knowledge of English avails us in acquiring Greek and Latin, as well as the modern European languages.

The Celtic tongues have only of late been shown to belong to the class of Indo-European languages; but the proof of their being so related is now considered complete. They suffer the same division into high and low as the rest of the family. The high are the Welsh, Cornish, and Armorican; the low are the Erse division, or the Gaelic, Irish, and Manx. The high languages are also the youngest, and the peoples they belong to are believed to have been the latest to occupy their seats in the west of Europe. The periods of the westerly migrations of the Celtic nations have not been clearly made out; one set of movements are traced to the sixth century before Christ, and others preceded this epoch by an unknown interval.

One striking characteristic of the Celtic tongues is their adhering to the same letters as the Sanscrit, Greek, and Latin, in the words that are regularly changed in the Gothic tongues. Thus in the word *tooth*, which is spelt with a *d* (danta) in Sanscrit, changed into *to* in all the German languages, the Celtic adheres to the Sanscrit; in Welsh it is *dant*, in Irish *dead*. So *pada*, Sanscrit; *ped*, Welsh. This peculiarity has enabled Dr Meyer to specify certain English words that have been obtained direct from the Celts, and not from the common ancestry of the Indo-European tongues. Thus *take*, *tread*, *taper*, *time*, are examples of words so derived; also *bake*, *bath*, *basket*, *bride*.

Another Celtic peculiarity is the regular alteration of certain consonants when preceded by vowels, evi-

dently to suit a certain habit of articulation. Thus the Welsh word *trav* (a house), when preceded by the prefix *a*, becomes *a-throv*, the mute being rendered into an aspirate. The Welsh *marw* (dead) becomes *di-avrus* (immortal), the labial *w* being changed into the vocal aspirate. This is the reverse of a Cockney peculiarity, which makes *divide*, *di-wide*.

Dr Meyer concludes, from a careful examination of the Celtic tongues, that while they are of the Sanscrit class, they have decided affinities with the Egyptian, the Semitic, and the Finnish languages, and may be regarded as more primitive or ancient than any of the other Indo-European tongues; that is to say, they broke off from the parent stem, and took a fixed set before any of the others had reached their characteristic development.

#### Tartar, Tatar, or Turanian Languages.

These languages belong to the vast group of nations that have received the name of Tartars, and are commonly understood to lead a pastoral and migratory life. They have never attained a high degree of civilisation, and what they have seems only in part their own. Their celebrity in the world has been owing to the conquests that they have achieved over civilised nations by the brute force of numbers. They cover the immense plains of Central and Northern Asia, and extend into the Polar regions of Europe. The name *Turanian* has reference to the high table-land of Asia, called *Turan*, as the lower table-land is called *Iran*.

M. Abel Remusat, in his work on the Tartar languages, divides them into four great tribes radically distinct from each other. Beginning at the east, where they are in contact with the Chinese, the first division is the *Tongous*. Their territory is divided into two halves by the line that fixes the frontiers of the Russian and Chinese empires. From them have proceeded, among others, the Mantchou Tartars, at present the ruling dynasty of China. The second division is the *Mongols*, celebrated for their conquests under Ghenghiz Khan. The greater number of their tribes are now under the power of China. The third division, more numerous than either of the other two, is the *Turks*, whose origin is more westerly: they also are known from their vast conquering career, and from their still possessing one of the largest empires of Europe. The fourth division is the *Tibetans*, or Tartars of Thibet, the more exclusive occupants of the table-land of Central Asia, and having, from their position, close connections with China, Persia, India, and Tartary. The Mongols have for a long time governed their country, but at present the Chinese exercise over it a preponderating influence.

Respecting the Tartar languages, M. Remusat sums up the conclusions of his researches as follows:—The words that refer to objects of the first necessity and prominence are radically different in all the four, and are not analogous to any other known language. The resemblances that may be traced throughout them all refer to the objects of the arts, to titles, dignities, and religious or philosophical ideas: they prove that there have been some common influences of commerce, war, politics, and religion; and they are of the same character as the words introduced from foreign languages. The grammatical forms are few in number and very little complicated; the relations of names are marked by affixes or annexed words, without elision or fusion; the verbs are in general without conjugations; the tenses most used are impersonal; the construction is rigorously inverse; their literature, like all their philosophical and religious ideas, is entirely borrowed.

Another class of nations, named the *Ugriak* tribes, are considered as having affinity with these four Tartar races. Their original country reached through northern Europe, from the Danish islands to the North Cape of Asia; but they have been driven from the greater part of this region, and the only portion of them now extant in the heart of Europe is the Magyars of Hungary. The Finns, Laplanders, &c. are of this race. The relations above alluded to, of some of the Celtic peculiari-

ties to the Finnish languages, may be connected with the fact, that the Celts, in marching through the European continent, most probably encountered Finnish or some of the Ugrian tribes. The Celts being the first of the Indo-European peoples to occupy Europe, they must have borne the chief brunt of the battle with its previous occupants of the Turanian family. It has even been supposed that the Celts must themselves be considered as a mixture of an Indo-European tribe with one of Finnish or Lappish descent.

The Old Iberian language of Spain, of which the Basque is supposed to be a relic, is likewise classed among the primitive languages of Europe, prior to the advent of any Indo-European people.

The aborigines of India, who were subdued from the west by an Iranian tribe, speaking the Sanscrit language, are also reckoned of Turanian or Tartar descent. In the south of India they are still traced as a separate race, having a speech allied to the Tartar.

Attempts have been made to include other scattered tribes in the same great family; but the evidence for such alliances is at best but precarious. For example, the languages of Australia have been supposed to have some affinity with the Tamulian or aboriginal Tartar of the south of India.

#### Semitic Languages.

The prominent members of this tribe are the *Hebrew* and the *Arabic*, to which are added the *Aramaic*, or the languages of the ancient nations of Aram, Syria, Mesopotamia, and Babylonia, which were Syriac in the west and Chaldaic in the east; and also the Ethiopic, or the ancient and now sacred language of Abyssinia.

The Hebrew language is remarkable on a great many accounts. Its alphabet has been adopted by European nations, whose own languages are of a totally different tribe. It is of a structure considerably different from the Indo-European tongues, and supposed to be in some respects more primitive than theirs. The roots are for the most part verbs; that is to say, action is the primitive idea of each—which circumstance, however, we have seen to be the most natural, or the most accordant with the operation of the human faculties in the invention of articulate sounds. What is more remarkable about these roots, is their being dissyllabic or trisyllabic; that is, they are made up of three consonants, or consonantal syllables. The inflections are formed by internal changes in the words, more than by affixes and prefixes, as in the Iranian tongues, being similar to the strong conjugation in English—as *come, came, brake, broke*. There is no verb of general affirmation like our verb *is, are, were*.

The Hebrew language has been found capable of the highest order of poetry, and the Arabic has served the purposes of scientific expression, as well as literary uses in general. The ancient Phœnicians and Carthaginians spoke a Hebrew dialect.

#### African Languages.

These languages are still a subject of active research, and are far from being completely known. The fullest account of them appears to be what was given by Dr Latham to the British Association in 1847. Dr Latham divides them as follows:—

- I. The Coptic class, containing the extinct dialects of Egypt.
- II. The Berber class, embracing the non-Arabic languages of Northern Africa.
- III. The Hottentot class.
- IV. The Caffre class, extending from the limits of the Hottentot country as far northward as Loango and the river Juba, west and east.
- V. An unnamed class falling into eleven subordinate groups:—

- |                       |                             |
|-----------------------|-----------------------------|
| 1. The Nubian group.  | 7. The Howassa group.       |
| 2. The Galla group.   | 8. The Mandingo group.      |
| 3. The Borgho group.  | 9. The Woloff group.        |
| 4. The Beharml group. | 10. The Fulah group.        |
| 5. The Boru group.    | 11. The Ibo-Ashantee group. |
| 6. The Mandara group. |                             |

In addition to these are six other languages still unplaced. Dr Latham gives copious lists from the vocabularies of these various tongues, and discovers a great many cases of coincidence, such as to show the probability of the common descent of many of the remotely-situated tribes.

The ancient Egyptian language is perhaps the most celebrated and interesting of the African tongues. The study of its structure has led some to the belief that it has a midway position between the Indo-European and Semitic languages, and forms a connecting link between the two, as if it were a branch from a very old and primitive language from which both these great tribes alike sprung. The affinities and resemblances of the Celtic, the most ancient of the Iranian tongues, to the Egyptian, have been brought forward to support this view. It is one of the points respecting ancient Egypt especially urged in the recent erudite work of the Chevalier Bunsen.

#### The Malay Languages

form a class by themselves. They are spoken in Malacca, and the islands of the East Indian Archipelago (Java, Sumatra, &c.), and are also found, in close proximity with Africa, on the island of Madagascar. The dialects of the Polynesian Islands in the Pacific Ocean have been lately identified with the same class; thereby furnishing an important clue to the peopling of these remote localities. A difficulty still remains with the Papua language, spoken by the black and woolly-haired tribes in Australia and New Guinea, who are also the aborigines of the island of Borneo, and who occupy a few small Polynesian islands.

#### Chinese Language.

Like other portions of their civilisation, the language of the Chinese is peculiar, and contrasts with all other nations. It has been called monosyllabic, not only to distinguish it from the trisyllabic roots of the Semitic tongues, but to show that it has not adopted the expedient of adding syllables to one another in the way of inflections, as in the Iranian languages. For denoting the connections, and relations, and circumstances expressed by inflections, it uses separate words; and in showing the exact force of these words, dependence is placed on their arrangement in the first place; and in the second place, on the tone and accent of their pronunciation. The words are all names of objects, and they require to stand for nouns, verbs, adjectives, or prepositions, as the case may be. There are said to be no more than a few hundreds of these syllable words to compose the language; these being multiplied three or four times by variety of accent.

The writing of the Chinese is wholly independent of their speech, and is the only language universally understood over the whole empire. It is exactly in the predicament of our numerals 1, 2, 3, &c., which are of no particular language, and have a different sound in each; being universal to the eye, but not to the ear. The process of comparing picture-marks with sounds, which gave rise to the alphabet, has never been performed by the Chinese.

#### American Languages.

These languages received the name 'Polysynthetic,' from their excessive tendency to agglutinate syllables into long words; and this being supposed to be a kind of inflection like the Greek or Sanscrit forms, it was thought to indicate a high order of speech. But in fact nothing could be farther from regular inflections than such a process; it being nothing but an indiscriminate huddling of syllables; sometimes two or three put on for the same meaning, evidently caused by a habit or instinct of flowing articulation. No satisfactory attempt has yet been made to classify these languages, or to trace an affinity between them and the other great families above-mentioned. Alleged affinities are denied by those most intimately acquainted with the languages themselves.

## CONSTITUTION OF SOCIETY—GOVERNMENT.

In the two preceding numbers we have drawn attention to the physical and mental constitution of man, and to the great instrument of thought by which he is enabled to give scope to the development of that constitution either in an individual or in a collective capacity. We devote the present sheet to a review of man's social nature—to that condition in which he lays aside the sole consideration of self, and enters upon a scheme of union and co-relation, whereby he finds his own happiness in the happiness of those with whom he is associated; and advances in civilisation and refinement not as an individual only, but as a nation or race, and that in proportion to the perfection of the social system he has been able to eliminate.

### CONSTITUTION OF SOCIETY.

Man is a gregarious animal; that is, he loves to herd together with his fellows—to live in society. There are, indeed, instances of men fleeing society, and spending existence in solitude, but these unhappily-disposed individuals form only an exception to a general rule. 'Man,' observes Dr Thomas Brown in his *Philosophy of the Human Mind*, 'is born in society, and dependent on it, in some of its most delightful forms, for the preservation of his infant being, which, without the protection of those who love him the more for the very helplessness that is consigned to their protection, would seem thrown into the world only to suffer in it for a few hours, and ceasing to suffer, to cease also to exist. If man be dependent on society for the preservation of his early existence, he is not less dependent on it for the comfort and happiness of his existence in other years. It is to be the source of all the love which he feels, of all the love which he excites, and therefore of almost all the desires and enjoyments which he is capable of feeling. There is not one of his actions which may not, directly or indirectly, have some relation to those among whom he lives; and I may say even that there is scarcely a moment of his existence in which the social affection, in one or other of its forms, has not an influence on some feeling or resolution, some delightful remembrance of the past, some project of future benevolence or resentment.'

Of a society to which man thus owes all his strength, as well as all his happiness, it is not wonderful that nature should have formed him desirous; and it is in harmony with that gracious provision which we see realised so effectually in our other emotions, that she has formed him to love the society which profits him, without thinking of the profits which it affords; that is to say, without regard to this benefit as the primary source of a love that would not have arisen but from the prospect of the selfish gain. We exist in society, and have formed in it innumerable affections, long before we have learned to sum and calculate the consequences of every separate look and word of kindness, or have measured the general advantage which this spontaneous and ready kindness yields, with the state of misery in which we should have existed if there had been no society to receive and make us happy. These affections, so quick to awake in the very moment almost of our waking being, are ever spreading in the progress of life; because there is no moment to the heart in which the principle of social union is cold or powerless. The infant does not cling to his nurse more readily than the boy hastens to meet his playmates, and man to communicate his thoughts to man.

What is every language but a proof of the agency of that feeling which makes it delightful to us to speak and to listen, because it is delightful to us to make

our thoughts pass into other hearts, or to share the thoughts of those other hearts! We use speech, indeed, in its vulgar offices to express to each other the want of bodily accommodations, which can be mutually supplied by those who know each other's necessities; and as a medium by which these wants can instantly be made known, it is, in these vulgar offices, unquestionably an instrument of the highest convenience, even though it were incapable of being adapted to any other purpose. But how small a part of that language, which is so eloquent an interpreter of every thought and feeling, is employed for this humble end! If we were to reflect on all those gracious communications, and questions, and answers, and replies that, in a little society of friends, form for a whole day a happiness which nothing else could give, the few words significant of mere bodily wants would perhaps scarcely be remembered in our retrospect of an eloquence that was expressive of wants of a very different kind; of that social impulse which, when there are others around who can partake its feelings, makes it almost impossible for the heart, whether sad or sprightly, to be sad or sprightly alone; and to which no event is little, the communication of which can be the expression of regard. In that infinite variety of languages which are spoken by the nations dispersed on the surface of the earth, there is one voice which animates the whole—a voice which, in every country and every time, and in all the changes of barbarism and civilisation, still utters a truth, the first to which the heart has assented, and the last which it can ever lose; the voice of our social nature bringing its irresistible testimony to the force of that universal sympathy which has found man everywhere, and preserves him everywhere, in the community of mankind.'

### Family Relationship—Marriage.

Human society is composed of families. A family consists of husband, wife, children. This is not an accidental or arbitrary arrangement. The family compact originates in the necessities of our nature; has existed since the creation; and, by the good providence of God, will continue till the end of time. Accordingly, all attempts to encroach on the obligations, as well as the privileges of the family relationship, have proved less or more nugatory, and must ever inevitably do so.

What is the fundamental object of the family compact is abundantly evident: a due provision for the affections, and for the nurture and education of children. This latter is insured by the matrimonial engagement—a solemn covenant between a man and a woman to attach themselves to each other through all the contingencies of life till the death of either dissolve the union. In every nation removed from barbarism, marriage is a recognised ordinance, guarded by law and custom. In some eastern countries, *polygamy*, or the marriage of a man with many wives, has long been tolerated; but that loose instances of this kind are a violation of a just and reasonable principle, is testified by the fact, that polygamy is not favourable to the rearing of children, and that it is inconsistent with the due equality of the sexes. In all countries in which polygamy is tolerated, woman occupies a degraded position, and society is rude and unexpansive in its character. Nature has designed woman to be the equal of man as a moral and intellectual being; and confined to the exercise of her own proper duties as a wife and mother, she is placed in a favourable position as relates to her own happiness and the happiness of her husband. And all this can only be realised by *monogamy*—the marriage of a man with but one wife. We have deemed it necessary to state thus unequivocally at the outset.

what appears to be the primary principles of human relationship; for there are not wanting parties who would endeavour to rear systems of society in which the family compact is to have no place, and parental care is to be absolved from its duties—a dream of the imagination, which the common sense of mankind will ever reject as visionary, and consider, for all good and enduring purposes, to be utterly impracticable.

Society, as has been shown, is necessarily composed of distinct families. The manner, however, in which these families should associate with respect to each other, is a question which has been often agitated, and here deserves some degree of notice. The true explanation, we think, lies in an appeal to nature.

It would appear that from the beginning of the world every nation has consisted of a certain number of families, and that each family, in its general circumstances, has been independent of others. Families, as in the patriarchal times, may have been less or more dependent on or connected with the head of a tribe; but we nowhere read of families yielding up their individual identity, and living in private community with each other. Each family has always had its own house, its own joys, sorrows, hopes, and fears. Each father of a family, a sovereign within his own domain, has been left to govern his little realm, and to undertake the obligation of finding his wife, children, and domestics in the means of daily subsistence.

A practice so universal cannot be supposed to be a violation of either nature or convenience. It has sprung up from the wants and feelings of mankind, and may be said to be a spontaneous result of unalterable circumstances. Tracing it to its true source in the mental constitution, we find that the independence of individual action affords the widest scope for personal enterprise, perseverance, and other useful emotions. No doubt it is selfish in principle, but selfishness may be productive of good as well as bad ends, and is acknowledgedly allied to some of the nobler aspirations. It is at least certain that individual independence, so far as family government, location, and industrial pursuits are concerned, is the basis of all which commands respect in civilised society.

In reply to this, it is urged that, by leaving society to spontaneous arrangement, there comes a time when each nation is consumed by its internal disorders. The clever, the industrious, and the persevering, become wealthy; vast numbers, either from lack of capacity or opportunity, sink into a state of extreme indigence; and a number become criminals, and prey on the others. There is truth in this severe statement of facts; for in every nation there are rich and poor, good and bad. Nevertheless, such a mingled tissue is only an inevitable consequence not of the mere structure of society, but of human nature, on which society is founded. If there be anything wrong, we must seek a remedy in the improvement of man's moral and intellectual constitution, not in subverting the whole organisation of society, and attempting to reunite it on fantastic, or, at all events, new and untried principles. Nor should any alarm be entertained respecting the lamentable evils which seem to be the doom of society as it at present exists. These evils, and they are great, will never utterly disappear, because human perfection is unattainable, but they will in time be much modified. In every region society goes through a period of infancy, during which many cruelties are perpetrated and privations endured; after this, as men become enlightened, the worst kind of evils gradually disappear, and others of lesser severity remain. At present, society in Great Britain and most civilised nations is in a transition state from barbarism to enlightenment. Within even the recollection of men now living, the steps in advance have been considerable, and every year adds to the number of both physical and social ameliorations. Can there be any reasonable doubt that society will continue in all respects to improve, and that much that is now matter for regret and reproach will be amended or removed?

#### Utopian Communities.

Ingenuous men have at different times conceived to themselves the idea of a state of society, or republic, in which vice, sorrow, indolence, poverty, and other evils shall either be unknown, or at least reduced to a scarcely perceptible amount. None of these theories has gained so much celebrity as that announced by Sir Thomas More, under the name of Utopia (from a Greek word signifying *no place*). The author was chancellor of England in the reign of Henry VIII., and was a man of the highest and most honourable character. His work on Utopia was written in Latin, and the elegance with which he propounded his apparently benevolent but really satirical scheme, has made the name of his imaginary republic to be adopted in our language as a current expression to denote any plan of social economy which is founded on too favourable views of human nature to be practicable.

The work was written not long after the discovery of America, near which continent, south of the line, the island of Utopia is supposed to lie. The story of discovering this island is represented as being told by a venerable traveller whom the author met at Antwerp, and may be condensed as follows:—

'Among other countries through which the traveller with his companions passed, there was one which appeared particularly worthy of attention: this was an island situated not far from the mainland, and called the Utopia, from an old chief of the name of Utopus. The island was about five hundred miles long, and about two hundred in the broadest part; but it lay in the form of a crescent, bent together at the ends, which were narrow, and not more than eleven miles apart; so that there was a large bay of the sea, as it were, in the very centre of the country. The entrance to this vast natural harbour was, however, obstructed by rocks, and hardly safe to any except natives, who were acquainted with the landmarks in view. The other side of the island had a number of harbours; but the coast being generally rocky, the roads leading from them into the country were steep and difficult. There are in the country twenty-four large towns, all magnificently built, and spacious; the situation of each is chosen so like that of the rest, that in the very arrangement of their streets, and their general appearance, when you see one, you have a complete idea of all the others. The same language is spoken over the whole island; and the laws, institutions, and manners of the towns are similar throughout. There are none of them above a day's walk from each other, and several only about twenty-four miles. The chief town is Amaurotum, which has been chosen on account of its central situation, as being convenient for the general meeting of deputies, of whom three are chosen from each town, generally men of some age and of experience in business, for deliberating on the public affairs. The cities are so situated, that each has a large country district lying around it, which is well stocked with farm-houses, and all the materials of a thriving husbandry. The land is cultivated by the townspeople themselves, who take it in turn, one set going to labour in the country, while another remain at their occupations in the town.

The cultivators are arranged, while in the country, into families of forty free persons and two slaves; with each family there is an elder and a matron of respectable characters; and over every three hundred families there is an officer called a Phylarch. Of the forty persons who compose a family, twenty return each season to the town, and are replaced by twenty others sent from thence; so that each person remains on the farm two years together, where by this means there is always a moiety acquainted with country labour, and able to instruct the others; numbers, however, request to remain a longer time, from the pleasure they take in farming and field-work. Their business is to attend to the crops, to rear domestic animals, and to prepare wood, and take it to the towns. They rear immense flocks of chickens, which, however, they

## CONSTITUTION OF SOCIETY.

hatch not in the usual way, but by the heat of an oven—a process in which they are very expert and successful. They raise corn for bread only, not for brewing or distilling; and for drink they have the vine, as we have, as well as the liquor of apples and pears. In laying out their land, they calculate how much corn, meat, and other produce will be wanted for a city and its dependent territory, and take care always to have a much larger quantity than is necessary, that after each district has supplied its own demand, they may be able to afford a portion in any quarter where there may be a deficiency. Whatever articles of the manufacture of the towns are wanted, the cultivators receive them on demand, without offering anything in exchange; and when the crops are ready for harvesting, the country phylarchs or overseers give notice to the authorities in the towns, upon which the whole population is set to work, and the crops are secured almost in a single day.

A description of the city Amaurotum will give a complete idea of all the others, which are as exactly like each other as may be. This place, then, is situated on a gentle slope, with a river flowing along the bottom of the declivity, which is navigable, with the waters of the tide, as far as the town; and there is a stone quay all along the bank, at which vessels lie to for delivering their cargoes. The town is of a square form; the streets long and straight, with a row of well-built houses on each side, before which there is always a paved footpath; in the rear, every house has a garden, with a door opening into it. The doors, both in front and behind, are made in such a way as to open readily with the hand, and to shut again of their own accord; but they are never locked, so that no one has any place of secrecy. They pay the greatest attention to their gardens, in which they raise abundance of the finest fruits, flowers, and herbs. Nothing can be more splendid or useful than the treasures of vegetable beauty exhibited there; and the founder of the town seems to have paid particular attention to the laying out of the gardens and garden-grounds, which the successive generations of inhabitants have continually improved.

With regard to their magistrates, every thirty families in the towns elect yearly a representative, who is called a Syphogrant; and to every ten syphogrants, with their constituencies, there is an officer or representative, who is styled a Tranibor. Lastly, the whole of the syphogrants, who are two hundred in number, after taking an oath to select the most useful candidate, choose by secret votes a chief magistrate, who is always one of four, of whom a list is given them by the people, each quarter of the city naming one. This chief retains his office during life, except there be reason to suspect his aiming at arbitrary power; but the tranibors, and all the other officers, are elected yearly. The chief meets with a council of the tranibors every third day, or oftener, if there be occasion, to deliberate on public business, or the suits of individuals; and there are always two of the syphogrants (or inferior representatives) present. It is a capital crime for the magistrates or chief to discuss public business anywhere except in the senate or great assemblies; a regulation which is enforced, that the authorities may not conspire in secret against the public liberties. In matters of great moment, a communication is made to the syphogrants, who consult their families (constituencies), and give in their opinion to the senate.

All the people are acquainted with farming, which they learn from their infancy, partly by instructions in the schools, and partly from practice, when their families are in the country. Besides this, every one is taught some other business—such as weaving, carpentry, or smith-work; and these constitute the most of their crafts. There being little variety of dress used in the island, except that those of the men and women are different (and both of them are very becoming), each family makes their own clothing. But of the other businesses, every person, male or female,

learns some one, the women generally performing the lighter portions of the work; and every person for the most part following the profession of his ancestors. Their labour is not heavy; for if the day be divided into twenty-four hours, there are only six of these devoted to work—three in the forenoon, and three in the afternoon. All the remainder of the time they have at their own disposal, not for idleness or dissipation, indeed, but for any rational amusement, such as reading, or hearing lectures on various subjects, delivered by persons who make literature their business. It may be supposed that, if they labour only six hours a day, they must be very poor, and that the country will be ill supplied with everything; but this is far from being the case; and the few hours which they devote to work are quite sufficient to procure all that is wanted for the necessities and comforts of life; of which you may be convinced, if you have remarked in other countries what immense multitudes of people go entirely idle, and produce nothing; or what a vast number, again, are employed in arts which are mere luxury and superfluity, or which injure the community instead of benefiting it; and yet these idle people and triflers consume much more of the labour of others than those who exert themselves to produce something really useful. In Utopia, on the other hand, there are but a very few persons in each city who are not employed in useful labour; even the syphogrants themselves, though exempt from working by the law, give what time they can spare from the public business to some profitable occupation, that they may afford an example to others. Students, who have been selected by the syphogrants and priests, and approved by the people, in order to follow the pursuits of literature, are exempted from manual labour; but if any of them disappoint the hopes entertained of him, he is returned to his work; and, on the contrary, any tradesman who in his leisure hours displays a talent for learning, is admitted into the class of students, and enjoys all their privileges. It is only from this class that ambassadors, priests, the senate (or tranibors), and the chief magistrate are selected.

Another circumstance contributes to the abundance of everything useful in Utopia; which is this—that no more labour is employed upon any matter than is necessary to make it useful. In other countries, the pulling down, remodelling, or rebuilding of houses, which have no fault but that they do not please the heir of the person who originally built them, occupies an immense number of workmen; among the Utopians, however, such waste of labour would be held ridiculous. In respect to dress, also, each person while at work wears a suit of clothes made of leather, or other stout materials, which will last for several years; and when they go abroad, they wear an upper garment, which is everywhere of the same colour and fashion; so that the only attention required for their clothes is to keep them clean, and in good repair. That waste of labour which is elsewhere expended upon the changing of fashions and different colours of dress, is never wanted in Utopia; and no one would either feel himself more comfortable, or be more esteemed by his neighbours, by having those endless changes which occupy so much idle time and expense in other countries.

I must now tell you about the way in which they carry on their intercourse with each other, and how the labour of one set of tradesmen procures them the necessaries which are manufactured by others. The whole people, as I mentioned, is divided into families, or small clans; and I should add, that when marriages take place between members of different clans, the females, who are not allowed to marry till the age of twenty-two, leave their own, and live with that into which they are married; while the sons, who must not marry till twenty-six, remain in the paternal family, under charge of the oldest surviving parent: no family, however, is permitted to have more than sixteen members, or fewer than ten. The city being

divided into four quarters, there is a market-place for each: to this rendezvous every family brings the produce of its labour, for each species of which there is a separate storehouse. At the same time that they thus deposit what they have produced, they take away with them what they have occasion for at home; and there is no danger that they should either bring too little or take away too much. Why should they be indolent when they have so little labour! or rapacious, or greedy, when they know that there is abundance, and to spare, for all!

Through the different parts of the town there are public halls, where the inhabitants eat together, every thirty families having a common table. They are summoned to their meals at stated hours by a trumpet or coach; but every person has liberty to eat at home if he pleases—a permission of which very few avail themselves, since the dishes at the public table are prepared by far more skilful cooks than they are themselves. The old and young are intermingled together at table, so that the latter may hear and profit by the conversation of their seniors. For the sick there are public hospitals in pleasant airy situations without the walls, where they are nursed with all care, and where every person is sure of meeting with more attention and skill than he could command at home, so that no one is reluctant to go and reside there while affected with any disease.

The Utopians have but a small number of laws, society being so regulated among them by their excellent customs, that a very few are sufficient to preserve order. They think that there is nothing more absurd among other nations than the innumerable multitude of volumes which are occupied with laws; and they ask with great reason, how can people obey rules which are either so obscure that no one can understand them, or so numerous that they cannot be read? With regard to their own laws, they think them useless if they seem obscure to the duller peasant; and none but the plainest and most obvious meaning is admitted, all subtle and refined interpretations being cast aside.

They never make war but for some gross injury done to themselves, or more especially to their allies; but they carry on their hostilities in a very singular manner. A Utopian general would gain no credit by a bloody victory, however complete: if he cannot overcome his enemies by stratagem and artifice, with little loss of lives, he is reckoned an unskilful commander.

There are different kinds of religion in Utopia: sometimes there are even different forms of worship in the same city. The sun is adored by some, and by others the moon; while a third class pay adoration to some of the planets, reckoning these as in some sort images or representatives of the Deity. When they were informed by us of the nature of the Christian religion, it is impossible to conceive the eagerness with which many among them listened, and made inquiries. A goodly number became Christians, and no one belonging to the old religion offered the least hindrance or obstacle to any of the converts. I recollect, indeed, no instance of any person being molested on account of his religion, it being an ancient law in the state of Utopia that no man's religion shall be made a reproach to him.

The stranger recounted to us a number of other circumstances regarding Utopia, which cannot be mentioned now. I was much inclined to dispute the propriety of a number of the regulations of the community, which appeared to me exceedingly absurd; such as their mode of carrying on war, and some of their ideas as to religion; but more especially that which seemed the keystone of the whole, their custom of possessing all things in common, and prohibiting the use of money—two regulations which would overthrow, according to the common opinion at least, everything which makes the splendour and power of a commonwealth desirable to its subjects.

Such is an account of the far-famed Utopia of Sir

Thomas More. In later times, schemes not very dissimilar have been seriously proposed by benevolent speculatists for the reconstruction of society, and partly carried into practice, though with no prospect of permanent continuance. At the head of this class of projectors stand Robert Owen and Fourier, the latter a religious enthusiast in France. The plan aimed at consists in causing fifty or a hundred families, as the case may be, to live in one community, in which all are to labour for the general behoof, and all to be supported on equal terms out of the common stock. Individual property is to be unknown; all personal feelings are to be sunk in that of the community. How it is proposed to meet differences as to the education of children, religious belief, and other important matters, how evil passions are to be universally extinguished, or what is to be the consequence of the idle preying on the industrious, has never been satisfactorily explained. According to Fourier, we believe, members seriously transgressing the rules are to be expelled the community, which amounts to a giving up of the whole principle: if the community cannot reclaim and retain its evil-disposed members, the scheme is confessedly worthless. Defective as ordinary society is allowed to be, it does not eject the most vicious or the most improvident of its members—for the criminal it finds prisons and penitentiaries, and to the poor and starving it offers workhouses; even the most dissolute can pick up an alms.

#### Patriarchal Society—Clanship.

The patriarchal condition of society has prevailed in Arabia and other Eastern countries from the most remote periods of history. It is the most simple kind of social union. A patriarch, so called from a word signifying father or head of a family, is the head or governor of a tribe, who obey his orders, and depend in a great measure on his judgment. Generally, the office of patriarch is hereditary, but it is also sometimes elective. The most distinguished of the ancient patriarchs was Abraham, the great progenitor of the Hebrew nation, and who was originally a dweller in Arabia. The leaders of tribes in these pastoral regions are now known by the title of *Sheiks*—the word sheik in Arabic signifying the elder or eldest.

In this rudimental state of society, the tribe has usually no fixed residence, but wanders from place to place in company with its flocks and herds, in quest of pasture, or for the sake of hunting wild animals. In making their long and toilsome journeys through the wilderness, the families and tents are carried on the backs of camels. From leading this wandering life, the members of these tribes are called *Nomades*; or are said to be *nomadic* in their habits, from a Greek word signifying to wander without a fixed habitation. The wildest of the modern Arabian nomades are termed *Bedouins*, which means inhabitants of the desert. They are good horsemen, and are reputed to be little better than robbers; for they seldom scruple to waylay and plunder travellers. The only chance of passing safely through their territories consists in purchasing the favour of their sheiks, and procuring their promise of protection. All expect, even for a trifling courtesy, a present in money, called by them *bucksheeah*. These forced presents are a serious tax on European travellers in Egypt, Syria, Arabia, and other Eastern countries.

From the accounts given of the patriarchal ages in the Bible, a much more favourable idea is formed of nomadic life than a close inspection is found to warrant. Carried away with pleasing fancies respecting pastoral simplicity and freedom from the cares of civilisation, we are apt to forget that human passions are the same in all ages and countries, and that every condition of life has its own peculiar difficulties and vexations. The truth seems to be, that this roving, haphazard mode of existence is full of miseries, and that force is the only law. Mr Stephens, an American traveller, who lately journeyed through Arabia Petrea, under the hired protection of a number of Bedouins,

## CONSTITUTION OF SOCIETY.

headed by their sheik, thus destroys the gloss which had been thrown over the nomadic social system:—

'One by one I had seen the many illusions of my waking dreams fade away; the gorgeous pictures of Oriental scenes melt into nothing; but I had still clung to the primitive simplicity and purity of the children of the desert, their temperance and abstinence, their contented poverty and contempt for luxuries, as approaching the true nobility of man's nature, and sustaining the poetry of the "land of the East." But my last dream was broken; and I never saw among the wanderers of the desert any traits of character, or any habits of life, which did not make me prize and value more the privileges of civilisation. I had been more than a month alone with the Bedouins; and to say nothing of their manners, excluding women from all companionship; dipping their fingers up to the knuckles in the same dish; eating sheeps' insides, and sleeping under tents crawling with vermin, engendered by their filthy habits, their temperance and frugality are from necessity, not from choice; for in their nature they are gluttonous, and will eat at any time till they are gorged of whatever they can get, and then lie down and sleep like brutes. I have sometimes amused myself with trying the variety of their appetites, and I never knew them refuse anything that could be eaten. Their stomach was literally their god, and the only chance of doing anything with them was by first making to it a grateful offering; instead of scorning luxuries, they would eat sugar as boys do sugar-candy; and I am very sure if they could have got poundcake, they would never have eaten their own coarse bread.

One might expect to find these children of nature free from the reproach of civilised life—the love of gold. But, fellow-citizens and fellow-worshippers of Mammon, hold up your heads! this reproach must not be confined to you. It would have been a pleasing thing to me to find among the Arabs of the desert a slight similarity of taste and pursuits with the denizens of my native city; and in the early developments of a thirst for acquisition, I would have hailed the embryo spirit which might one day lead to stock and exchange boards, and laying out city lots around the base of Mount Sinai or the excavated city of Petra. But the savage was already far beyond the civilised man in his appetite for gold; and though brought up in a school of hungry and thirsty disciples, and knowing many in my native city who regard it as the one thing needful, I blush for myself, for my city, and for them, when I say that I never saw one among them who could be compared with the Bedouin: I never saw anything like the expression of face with which a Bedouin looks upon silver or gold. When he asks for bucksheesh, and receives the glittering metal, his eyes sparkle with wild delight, his fingers clutch it with eager rapacity, and he skulks away like the miser, to count it over alone, and conceal it from all other eyes.'

The same species of patriarchal society prevails, as is well known, among the tribes of North America; each tribe being governed by its chief, and exposed to all the calamities of a state of untutored nature.

Out of the patriarchal condition of society in the East, sprung the system of clanship, long prevalent among Celtic nations. The word *clan* signifies family, and is applied to a tribe claiming to be descended from one head; the lineal descendant of which is the chief. All the members of the clan consider him as a common father and protector, to whom they owe an implicit obedience. This form of society was brought into western Europe by the Celts in exceedingly early times, and disappeared slowly before the encroachments of the Teutonic races. The last of its strongholds were the Highlands of Scotland, where it was finally abolished by law in 1748, and where it is now only known as matter of tradition or private feeling.

### Slavery.

That every human being possesses a free and inalienable right of property in his own person, seems an unde-

niable proposition. And yet it is one which even till this day is by no means universally recognised. In certain countries, there are individuals—men, women, children—who are not proprietors of themselves; they are bought and sold, and treated as cattle; and they possess no civil rights whatsoever. A person in such circumstances is called a *Slave*—a word of modern origin, supposed to be derived from the Slavi or Sclavonians, whom the Venetian merchant state had the cruelty to sell into bondage.

Slavery, in one form or other, has existed in the world from the most remote period of history. It existed, as we know, among the patriarchs. Joseph was sold by his brethren to a party of Midianite merchants, who carried him to Egypt, and there sold him to Potiphar (Genesis, xxxvii). A grievous famine having occurred in Egypt, the people, after disposing of all their property in exchange for corn, came to Joseph and offered their own bodies and their lands for food. Joseph complied with their request. 'Behold, I have bought you this day, and your land, for Pharaoh,' (Genesis, xlvii. 23.) These occurrences alone, mentioned without comment, show that selling and buying human beings was customary in those early times. From other parts of the Scriptures, we learn that a state of bondage, which was nearly equivalent to modern slavery, was a recognised institution among the Jews. So also did slavery exist among the ancient Pagan nations—the Phoenicians, the Greeks, the Romans.

Nothing is more certain than that, in all countries in ancient times, there was a mass of the population in a state of compulsory and perpetual servitude. Even in what are termed the freest states of antiquity, a large proportion of the people were slaves, and possessed no civil rights. At one time Athens contained four hundred thousand slaves, and only twenty thousand freemen. The practice of slavery arose out of the selfishness of barbarism, and did not appear to its perpetrators either sinful or unjust. Debtors were seized, and, in liquidation of petty claims, sold like ordinary property by their ruthless creditors. Gamblers, having lost everything, staked their persons as a last chance; and being unsuccessful, became the bondsmen of the fortunate winner. Men, for their crimes, were deprived of liberty, and publicly sold into bondage. In cases of famine, parents disposed of their children, to relieve their own wants. And lastly came war, the scourge of mankind, and the fruitful cause of slavery in all ancient nations. 'It was a law established from time immemorial among the states of antiquity,' says a Greek author, 'to oblige those to undergo the severities of servitude whom victory had thrown into their hands.' There was an exception, however, in the case of civil war, the prisoners taken in which were not made slaves, but generally massacred. Besides the regular wars between nation and nation, it sometimes happened that a vagrant population overran an adjoining country, and made the peaceful and dispossessed inhabitants their slaves. Thus the Spartans were served by a race of hereditary bondsmen, the old inhabitants of the district, called Helots—a term afterwards used by the Romans to designate men in a servile condition. The unfortunate Helots of Sparta occasionally rose in rebellion against their masters, and attempted to gain their liberty; but these efforts were always suppressed with merciless slaughter.

We have, in these and other circumstances, the most conclusive evidence that slavery in ancient times existed on no ground of philosophy or morals—was not sustained on any fine-spun plea that one man was radically inferior to another; but was, as it is still, only a result of rapacity and force. It was long, indeed, before mankind could be brought to recognise its iniquity or impropriety; and even yet certain nations find a difficulty in viewing it in its true light. There being thus still some controversy on the subject, and liability to misconception, we think it proper to state that, according to an enlightened philosophy, each human being retains inherently the right to his own person, and can neither

sell himself, nor be legally bound by any act of aggression on his natural liberty. 'Slavery, therefore'—we quote from the *Conversations Lexicon*—'can never be a legal relation. It rests entirely on force. The slave, being treated as property, and not allowed legal rights, cannot be under legal obligations. Slavery is also inconsistent with the moral nature of man. Each man has an individual worth, significance, and responsibility; is bound to the work of self-improvement, and to labour in a sphere for which his capacity is adapted. To give up this individual liberty, is to disqualify himself for fulfilling the great objects of his being. Hence political societies, which have made a considerable degree of advancement, do not allow any one to resign his liberty, any more than his life, to the pleasure of another. In fact, the great object of political institutions in civilised nations, is to enable man to fulfil most perfectly the ends of his individual being. Christianity, moreover, which enjoins us, while we remain in this world, to regulate our conduct with reference to a better, lays down the doctrine of brotherhood and mutual love, of 'doing as we would be done by,' as one of its fundamental maxims, which is wholly opposed to the idea of one man becoming the property of another. These two principles of mutual obligation, and the worth of the individual, were beyond the comprehension of the states of antiquity, but are now at the basis of morals, politics, and religion.'

Regardless, or ignorant of such principles, the most enlightened nations of antiquity, as we have said, gave the broadest sanction to slavery; and to this, among other causes, was doubtless owing their final dismemberment. The influence of Christianity modified slavery, and finally contributed to extinguish it in European nations; but till the present day, as is well known, the slavery of negro races, or of persons of colour, is maintained in all its horrible rigour in some of the states of North and South America. In Africa and Asia the institution remains almost unchanged.

#### Civil Society.

Civil society is constructed on a system of individual efforts and interests. Each person is expected to act an independent part, controlled only by law and usage. While every one is free, therefore, he is at the same time bound to give obedience to all existing laws, and respect to all properly-constituted authorities. In consequence of the general freedom which every one enjoys, and in contradistinction to the plan of social communities, society is said to be founded on the *competitive* principle. No one being interfered with, all are left to compete with each other in industrial enterprise. This may, and does, have the effect of causing a great disparity of condition—men of commanding abilities, steadiness, and perseverance, usually attaining distinction and wealth, while those of weaker capacity, or who are less fortunate, lapse into poverty. It is to be regretted that such is the case; but, all things considered, freedom of individual enterprise is best, and must ever be the basis of civil society. By holding out a premium for diligence, it induces mental culture and exercise, and affords all an equal opportunity of distinguishing themselves. It likewise ought to point out the duty of establishing systems of universal education, by which we should be assured that every one at least possessed the elements of instruction, and means of self-advancement. With respect to those who, from absolute incapacity, and other unavoidable circumstances, become poor, it is now a generally settled principle that they have a claim in law, as well as on principles of humanity, for support from their more fortunate fellow-creatures.

The organisation of civil society, though possessing a general resemblance, differs in a few particulars in every country. The chief difference consists in the diffusion of privileges. To understand distinctions of this nature, it is necessary to peruse a course of history, ancient and modern. Little can be learned from looking at the present aspects of things; we require to

search the records of human progress for the origin of almost every institution, as well as for the philosophy which may be drawn from it.

Throughout Europe, society has generally arisen from similar circumstances. The rudimental germ of every state was a handful of adventurers, who, by military prowess, made themselves masters of the country. The leading men in such enterprises were chiefs with retainers. The principal chief became king; the chiefs assumed the character of an aristocracy; and the retainers, with the inhabitants whom they helped to subdue, from being at first serfs, finally attained the rank of a free democracy. It was long, however, before this latter result was achieved. For many ages, the chiefs or nobles holding lands by a military tenure from the sovereign, formed a feudal aristocracy, by whom in reality the whole system of government was conducted. The idea of imparting privileges to the common people was long in dawning on the mind; and if the nobles had had the power, these privileges never would have been granted. What, however, is not less interesting to know, the people were not by any means unanimous in desiring freedom. As long as they were serfs or vassals of great men, they were fed, clothed, and protected; and such was the meagreness of capital, the absence of any means for individual enterprise, that freedom would in many cases have been equivalent to starvation. (See HISTORY OF THE MIDDLE AGES.)

The true source of general freedom is the crown. From having been companions and assistants of the sovereign, the principal barons were constantly encroaching on his prerogatives. Sometimes the concessions of the crown, as those of Magna Charta, made by King John, were necessary and desirable; but more frequently the nobles were inclined to exact so much power in the state as would have rendered the king's authority a nonentity. The danger of these encroachments caused the monarch to seek aid from the commons. With the view, therefore, of raising up a means of protection in this quarter, he encouraged the building of cities, to whose inhabitants he gave certain important privileges. The civic corporations, therefore, must be viewed as the cradle of freedom. From them sprung much of the present constitution of society. Relying on their privileges, and surrounded by walls, these burgher communities defied the nobles, and sided with the king. From this time, therefore, the feudal principle declined, serfs were gradually emancipated, and ultimately every man was declared to be equal in the eye of the law.

It is necessary to be thus particular, for a notion prevails among the humbler classes that they have been deprived of rights enjoyed by their ancestors. History most explicitly shows that, in early times, the peasantry and operative bodies possessed no privileges whatever. Magna Charta does not so much as mention them. Society, in fact, has been quite a progressive development. Little by little, privileges have been widened in their sphere, and are still widening as circumstances render it desirable. Doubtless it may be alleged that all men are equal, and deserve to possess equal privileges. But to this principle, true in the abstract, there are some practical objections, which will afterwards engage attention. Meanwhile, we desire to fix attention on the vast impulse given to civilisation by the erection of cities.

#### Cities.

It is to cities or large towns that mankind chiefly owe the blessings of civilisation, and the valuable institutions which they now enjoy. With cities, everything that is great and glorious—arts, science, literature—began, and after beginning, was duly fostered. Through their means civil society began to assume a more systematic character. The division of labour, the refinements of social intercourse, the development of laws caused by the conflicting interests of many people living closely together, the idea of equality of rights, the growth of patriotism, springing from the sense of

## CONSTITUTION OF SOCIETY.

advantages enjoyed, and the exertions necessary to maintain them, were the salutary consequences of the establishment of cities.

Under the mild sky of Asia, Africa, Greece, and Italy, cities were built first, and in the greatest number. The Phœnicians and Egyptians particularly distinguished themselves by the erection of cities, which soon attained a high degree of wealth, and consequently of civilisation. The Egyptians considered their city Diopolis (Thebes) older than any of the Greek cities; and Pliny says that Cecropia (erected in Attica by Cecrops, 1582 B.C., and afterwards called Athens) was the oldest city of Greece. Several confederations of cities existed in the ancient world; for instance, the Phœnician, consisting of the cities of Tyre, Sidon, &c.; and the Achæan league, formed by the most important cities of Greece, in order to strengthen themselves against the power of Macedon. Under Augustus and his successors, the Romans began to establish colonial cities in Germany, having done the same long before in Gaul, Spain, Africa, &c. In Switzerland, they first erected cities about A.D. 70, which, however, were mostly laid waste by the Alemanni, and subsequently rebuilt under the government of the Franks (A.D. 496).

The Germans, accustomed to a wild, rambling life, did not show any disposition to live in cities, until Charlemagne laboured to collect them together in settled abodes, from his desire to civilise them. Henry I. distinguished himself particularly in this way, and on this account has been called by some Henry the City-builder. He gave the cities great privileges, in order to induce his subjects to live in them, and thus laid the foundation of that power which at a future period contributed most to break down the feudal system. In many cities, imperial castles were erected to protect the inhabitants; and the insupportable oppressions and even cruelties exercised by the feudal lords upon their peasants, or by the wandering knights and robbers, drove many people into the cities. The attacks of the neighbouring lords gave firmness to their union, and compelled them to cultivate their resources. Commerce, and the various arts and trades, were soon cultivated within their walls, and their wealth and respectability increased. They soon became sensible of the want of a better system of laws and administration than that which prevailed around them, and the principle of equal rights and laws was quickly developed.

One of the most important remnants of the great fabric of ancient civilisation, was the cities of Italy. What the world would have become without them is not to be calculated. In spite of their bloody contests with each other, and the vices to which these gave rise, they must be considered as having lighted the torch of modern civilisation. It was not the monarchies, it was not the courts of the great princes, it was the cities of Northern Italy, which opened the way for the progress of improvement; and the petty princes of Italy caught from them the spirit which prompted their efforts to promote it. Under the reign of Conrad III. (1138-52), the cities of Lombardy, and particularly Milan, which stood at their head, had acquired a high degree of wealth and power, and had formed themselves into a confederation. The struggles between the emperors and these cities form one of the most important portions of the history of the German empire and of Italy. Frederick I. in vain demolished the powerful city of Milan. It was soon rebuilt, and the cities of Lombardy, in alliance with the pope, obliged the emperor to conclude with them a very disadvantageous peace at Constance. Two other confederations of cities, highly important, were formed during the interregnum of the German empire, between 1256 and 1272. One of them was the powerful league of the Hans towns; the other, the confederacy of the High German and Rhenish cities, from the foot of the Alps to the mouth of the Maine, established by Walpode of Mentz, in 1255. A similar confederacy, and a very important one, was that of the Suabian cities, instituted in 1488,

to repel the outrages of the feudal lords and knights. By degrees, great cities arose in the different countries; and wealth, industry, knowledge, and equal laws, spread from them through Europe.

Much has been said and written against the immorality of large towns and cities, and the fact cannot be denied; but immorality is not confined to them. The petty vices of small places, though less glaring, are perhaps equally injurious, making up in constant repetition for their comparatively less degree of noxiousness. It is much more difficult, moreover, to preserve one of the most important possessions—independence of character—in a small place than in a large one. The cry against the immorality of large cities should not make us forget the many great and admirable things which mankind have been enabled to perform by means of the collected strength of talents and resources combined in large cities, and their influence in forming the character of great men, who could not have acquired elsewhere their variety of accomplishments, and the well-proportioned cultivation of their various faculties. At the same time, we must allow that it is a very injurious policy to strip a whole country of all which illustrates and ennobles it, in order to swell the treasures of the capital.

Capitals, in the modern meaning of the word, can hardly be said to have existed in ancient times; at least they were then only the seat of the sovereign, but not the centre of all the national activity, Rome only perhaps excepted; but this city was for a very long time, the state itself, and, at a later period, the tyrant of the whole empire, rather than the head of a well-organised body. In Asia there existed, indeed, in ancient times, capitals of very large empires; but they are not to be compared to the capitals of large modern empires, since the channels of communication and intercourse had not then reached that degree of perfection which enables them in our days to bring into close connection all parts of a country. Each province was therefore left much more to itself. It would be difficult to determine whether the good or evil consequences of large capitals in modern times are greater, and such an examination would far exceed our limits; otherwise it would be very easy to point out, in every department of civilisation, in science, social intercourse, arts, &c. both salutary and pernicious effects resulting from the influence of capitals. It seems to us a matter of little doubt that it must be regarded as disadvantageous to any country if the capital ceases to be the concentration of the skill, genius, and strength of a nation, for the benefit of the whole, and by a disproportionate superiority destroys the importance of the rest of the country, as we find to be the case with Paris, which, as has been often observed, contains France. In Germany, the state of things is quite the reverse. There is no city which may boast of being the point of national concentration. The consequences have been very advantageous to science, and somewhat disadvantageous to literature. In politics, this want of a central point has had melancholy consequences for Germany. London never exercised that degree of influence over England which Paris has over France; one reason of which may be, that the institutions for the diffusion of knowledge are not seated in the metropolis. The system of concentration has, there is little doubt, been carried to an extreme in Europe—the best of everything having been collected in the capitals, and the provinces having been almost stripped of pictures, libraries, &c. In many countries this fault is acknowledged, and a return to a more equitable system is perceptible. The injury done to the provincial towns in Britain by the concentration of institutions of various kinds in the capital, is likely soon to be greatly modified, by the establishment of railways and other improved means of communication, which will tend to give all parts of the kingdom an equality of advantages.\*

\* The above observations on cities are abridged from an instructive article in the 'Conversations Lexicon.'

## GOVERNMENT.

If all mankind were naturally virtuous, and disposed to act justly and kindly towards each other, there would be little use in establishing any kind of government. According to ancient poets, there was once a period called the Golden Age, in which there prevailed universal peace and loving-kindness, and vice had no existence. Never was there such a period. The farther back we go in history, we find that society was the more rude. Civilisation has been a plant of slow growth, often retarded, and often springing up afresh. The world never was better than it is at this moment. According to all experience, society cannot exist without some species of government. It must possess a power to enforce order, to prevent the strong from oppressing the weak, to chastise vice, and perform many other necessary functions. The government may be good or it may be bad, but a government of some kind there must be. There will always, in every society, be some who have a desire to rule over others—to make others work out their purposes—and some who are satisfied to submit to the domination of those who are more ambitious. There will always be among those who are ambitious of governing, some who unite to the desire the talents necessary to enable them to attain their ends, and others who do not; some who seek to found their power upon their own force, or upon the prejudices of others, or upon their power of persuading or convincing men that they know better what is good for them than they do themselves. The propensities and faculties which induce and enable some men to aspire to be leaders, others to contest the leadership with them, and others, again, contentedly to follow the lead, are implanted in them by nature; they cannot help having or exercising them. But it is with these elements of our nature as it is with our instinctive propensities to eat and drink, to love or hate; by the proper use of their knowing and reflecting powers, men may so control and direct them, as to render them instruments for producing great good and happiness to the whole human race.

## FORMS OF GOVERNMENT.

The patriarchal and clanish systems of government have been already adverted to. With these mankind may be said to have made a beginning. The next step in progress seems to have been a government by kings. The origin of kingly power is fighting. He who was the bravest warrior, assumed, or was given, the office of king, with a supreme dictatorial authority. In some ancient nations, a government of priests superseded that of kings. This species of government was called a *theocracy*, from *Theos*, the Greek word for God; it being represented by the priests that they ruled only according to the decrees or will of God. Although to a great extent based on superstitious fears, the priestly governments were an advance on governments of mere fighting men, because they preserved tranquillity, and, on the whole, were for the benefit of the people.

Out of these early systems of government, in conjunction with the experience of ages, all existing governments have sprung. Although, however, there is nothing of which mankind has had so extensive or so varied a knowledge, it is till this hour undetermined whether there be such a thing possible as a perfect government. Much has been written on the subject; but the result of all inquiry seems to be, that nothing is certain, except a few general principles. Those, therefore, who contend for any particular model of government, without a due regard to circumstances, only pursue a delusive fancy. No species of government that could be devised will apply universally. Schemes the most brilliant on paper come to nought when tried by the rude shocks of daily events. Forms of government, in short, are as yet arbitrary and unsettled; and the only practical principle of any value which we know is, that every nation should possess a

government in harmony with its state of civilisation, and the tastes and habits of the more enlightened portions of the community.

As there is, in the present condition of the world, no such thing as a universally suitable form of government, so the form of government of any particular country requires to vary and alter its character in adaptation to the advance or retrogression of society. In proportion as the people are ignorant and turbulently disposed, the government requires to be strong and arbitrary; and according as the people are enlightened, and disposed to live peacefully, the government may be mild and liberal. The ambition of kings and emperors no doubt is observed to sustain an arbitrary rule in circumstances where greater freedom should be accorded; but as a general principle, it is evident that arbitrary military governments can only exist permanently where the people at large are incapable of guiding and enjoying free institutions. Sooner or later, the government of every country must bring itself into harmony with the society it overrules, otherwise it will suffer the risk of being overthrown. The cause for this is evident. It cannot escape notice that every government acts upon its subjects by means of themselves; it employs its subjects to keep its subjects in obedience. The consequence of this is, that in every country, and in all ages, the most seemingly despotic government is kept in check by the opinions of its subjects. No government has ever with impunity set at defiance the opinions, be they well-grounded or be they prejudices, moral and religious, of its subjects. The Ottoman sultan, at the time when his power was greatest, never dared to act contrary to the law of the Koran. Henry II. of England was obliged to humble himself before the religious sentiments of his age, outraged in the person of Thomas à Becket. Civil government—political action—is human ingenuity working by human means. It is this necessity under which every government lies, of governing its subjects by its subjects, which puts the whole community in possession of an engine, by the proper application of which, government may be obliged to work for the general good.

Government being thus compelled to a certain degree to make justice and the good of the community its aim, it is important that the community be so enlightened and organised in opinions and wishes that it will easily and unobtrusively act on the controlling authority. There is another object to be gained by thus enlightening and organising the people, besides that of making them an efficient check upon government when it goes wrong; it is only by enlightening and organising the people that they can be rendered capable of lending due force to the operations of government, when these are what they ought to be. An unenlightened people is quite as likely to entertain mistaken notions of what is for its good as correct ones; it is quite as likely to oppose government when it tries to do what is right, and to support it when it tries to do what is wrong, as the reverse. Government was in the right when, about the year 1780, it repealed some of the worst enactments against the Catholics; but the people were so far from heartily approving of this act of justice, that Lord George Gordon's riots in London, and the burning of Catholic chapels in Edinburgh, had nearly frightened government out of its good intentions.

The first step, then, in making such arrangements as are necessary for keeping government in its just and useful line of action, is to enlighten the people. There goes more towards *enlightening* the people than merely giving them school instruction, however thorough and extensive that may be. The people require to take every opportunity of acquiring knowledge, of extending their stock of ideas, of elevating their tastes, and of cultivating a brotherly benevolence. The great retarding influence in every nation has been less the arbitrary will of government, than the mass of ignorance which has nestled in the bosom of society. A consideration of this circumstance ought to temper observations on the strictly monarchical and aristocratic forms of government.

**Aristocracies.**

An *aristocracy*, a class of privileged nobles, has its origin in the circumstance that greater skill, enterprise, intelligence, and perseverance, at first threw a comparatively great amount of wealth and power into the hands of a few families; that the management of that wealth, and the exercise of the power and influence, were occupations calculated to give a greater practical development to the propensities and faculties of their descendants, than the routine drudgery of those who earned their daily food by their daily labour. We have no desire to palliate the evils of aristocratic government. That degree of enlightenment which enables men to lord it over others, is not necessarily accompanied by that higher enlightenment which teaches the beauty and utility of self-control, and the exercise of justice to all. But we must not, therefore, shut our eyes to the fact, that aristocratic government is one of the stages through which all societies must pass in their way to something better; that society advances as man walks, by putting one part of the body foremost, and dragging the rest up to it; that the love of power, and skill in acquiring and exercising it, must be realised in the few, in order to excite the desire of a share of it in all. That inequality of civilisation which gives rise to aristocratic power and influence, exists in many different forms and modifications. Even in our own country an uncivilised class is found—that unfortunate class which supplies the precarious demand for the lowest kinds of unskilled labour, and which fills our police-offices and other courts of justice with the greater number of the victims to the security of society.

In a rude society, there is wanting that enlightenment which is necessary to confer upon the subjects or citizens the power of keeping their government in the path of its duties. In a partially-civilised society—a society in which some classes are considerably advanced in civilisation, while others are still rude, helpless, and ignorant—only a portion of the citizens will be able to exercise this control. They will exercise it to their own advantage, neglecting the interests of the powerless classes, most frequently from thoughtlessness, but sometimes at the impulse of motives still less excusable. The only guarantee men can have for good government, is their *power* to exact it; and the foundation of that power is knowledge or intelligence—intelligence imparted by civilisation, and heightened by teaching—knowledge diffused through every section of the community. Wherever there is an ignorant class, it will be weak; and wherever men are weak, they will be oppressed. No chain can be stronger than its weakest link; no society more powerful than the most ignorant section of its members.

Experience has shown to both governors and governed that the preservation of rights from attempts at invasion is a paramount duty. The Roman plebeians, as measures of self-defence, obtained from their rulers, at different times, *tribunes* invested with power to guard their rights, the right of electing one of their own number to be consul, and various other concessions, all which at the time appeared to them to be sufficient to assure them of just government in time to come. In our own country, Magna Charta and the Bill of Rights were bargains struck between the governors and the governed for the same purpose. All these arrangements, whether well adapted to promote the end in view or not, are what are called constitutions, or constitutional governments. They are bargains struck between the government and the people at large, awarding to each party certain powers or privileges, which the other becomes bound to respect. The object in view is to render it possible to check those evils at the very outset, which, if allowed to go on, lead to revolts and revolutions—to enable the people, by keeping a steady watch over the motions of their rulers, to mark their first aberrations from the right, to remonstrate in time—to prevent injustice, instead of revenging it.

Constitutions of government have been devised and adopted as various as the habits, opinions, amount of wealth and knowledge, and distribution of them among the people who have devised them. A constitution is adopted in the belief that it will secure the enjoyment of their just rights, alike to the governors and the governed; it is an arrangement by which the privileges of all are equally secured; or, to use a familiar explanation, it is a bargain made between the governors and governed, or among the whole members of society mutually, as to how the government shall be conducted, so as to insure civil and religious liberty—liberty of action, and liberty in the expression of opinion, within certain legal limits. A constitutional is thus the highest form of government—the only kind of government worthy of a civilised community.

**Despotisms.**

At the present time, the greater proportion of the governments throughout the world are of the character of *despotisms*, and comparatively few possess what are called *constitutions*. Of the multifarious class of despotisms which exist among barbarous nations, it is here needless to say anything; for the question of form of government only becomes interesting when applied to a wholly or partially-civilised people. The three great despotisms in Europe are Russia, Austria, and Prussia—though the latter is now perhaps entitled to be removed from this class, in consequence of the king having granted a modified constitution. Austria and Russia are rigorous despotisms, each being governed exclusively by an emperor. In these countries, any one can be legally seized, without previous notice, and transferred to a dungeon for life, or sent as an exile to a distant part of the empire. The press is under a rigorous censorship, travelling is regulated by passports; and the whole people are under the eye of a strict military police. We may be sure that the community which submits to all this is still in a transition and unsatisfactory condition.

**Constitutional Monarchies.**

Europe abounds in constitutional governments, but many of them are scarcely entitled to the name. Sardinia, Saxony, Sweden, Hanburg, and all the smaller German states, have constitutions of one kind or other; that is to say, the king, grand-duke, chief ruler, or by whatever title he is called, is restricted in his designs by estates composed of delegates from different orders of the people. We should consider it quite useless to present detailed explanations of these constitutions, because all, or nearly so, are little better than a mockery. The reigning monarch can either directly neutralise the will of the estates, or he and they, together or separately, are under the influence of armed intervention. The Dutch have a constitution, but they have no right of public meeting for political objects; their press is under a censorship; all must carry passports; and every citizen, in any kind of trade or profession, is required to pay for a license. The infant and still disorganised constitutions of Spain and Portugal it is unnecessary to notice. At present, Germany is making efforts to establish a constitution of the different states collectively; the probability is that these aims will not be realised without much disorder and suffering.

*British Constitution.*—From the raw and ill-regulated constitutions of most continental nations we ascend to the old-established and well-guaranteed constitution of the United Kingdom of Great Britain and Ireland. The government of this large empire (which we need not here particularise, as it will be fully treated of in our article CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE) is a perfect anomaly, and, though frequently imitated, has never, in a monarchical form, been excelled. The legislature, as is well known, consists of a hereditary sovereign (king or queen, as the case may be), a hereditary House of Peers, and an elected House of Commons. A *Parliament* is the term used to express the collective bodies of King, Lords,

and Commons. Electors of members of the House of Commons must be native or naturalised subjects, males of twenty-one years or upwards, of sane mind, not concerned in the management or collection of the revenue, not holding any office in the metropolitan police, and not legally convicted of perjury, subornation of perjury, or bribery. In counties, an elector must be possessed of property in perpetuity or liferent to the value of £10 yearly, or lands held at a yearly rent of £50. In cities or boroughs he must be proprietor of a house or shop valued, along with the land attached to it, at £10 yearly and upwards; or must occupy premises for which he pays a rent of at least £10 per annum.

Such, with certain modifications, is the principle on which members are elected. In practice, it is found that much of the elective privilege is exercised by, or under the influence of, the landed gentry, in which we include the titled aristocracy of the country. At no time have what are called the lower or working-classes (freemen excepted) possessed the elective privilege; and it has only been since the Reform Act of 1831 that the middle classes (shopkeepers, master tradesmen, manufacturers, farmers, &c.) have had the semblance of direct representation. With this alteration, however, it cannot be said that the legislature has undergone much material improvement. Too frequently the members are still nominees of the landed gentry, or of corporations; and so much time is usually spent in electoral intrigues, parliamentary debates which lead to nothing, as well as the conciliation of parties, that the business of the nation is continually falling behind, or but indifferently executed.

In whichever way it is viewed, the legislature of the United Kingdom is essentially the reflex of the landed gentry and aristocracy, and consequently the interests of these classes are uniformly the chief matter for consideration. The next great interest cared for has till lately been the West India interest; next the shipping interest; next the military and naval interests; and lastly, the commercial interest, and the interest of the people. The executive, reposed in the hands of a responsible ministry, takes its character from these competing interests. The execution of any project of law or government is, to all appearance, rarely a result of principle, but in almost every case an immediate consequence of temporary expediency. Power is attained by skill in gaining a number of supporters, and retained by skill in keeping them together. So much of the British statesman's efforts, during his apprenticeship to power, and his exercise of power, are devoted to the getting and keeping of power, that he is necessarily deficient in natural and acquired administrative talent. The manner in which the administrative functions of government are executed, depends upon the industry and honesty of officials not responsible to public opinion, not liable to be dismissed unless convicted of gross dereliction of duty, and of whom their chiefs ask little more than sufficient attention and skill to save them from successful criminations by opposition. This kind of organisation weakens the direct pressure of public opinion upon administration; and, at the same time, by encouraging personal canvassing for political support, and the cultivation of impressive oratory, diverts public attention from the dry business of government, to sympathise with personal squabbles, and attention to abstract questions, more imposing, but less immediately important, than practical details. The consequence is, that the British government, more than any other in Europe, has been characterised by the expenditure of immense energy, with very disproportionate results.

Whether any further introduction of the democratic principle (lowering the elective franchise) into the constitution would improve its qualities, is extremely doubtful. The people, taken in the mass, are still far from being instructed. A vast number can neither read nor write; and such is the distressing state of poverty and wretchedness of large communities in towns, that, with their small knowledge of public affairs, and liability to be corrupted, it is to be feared they

would appoint men of inferior qualifications, or who ever paid them most liberally. The freemen voters (working men) of Norwich, and some other towns, make a regular sale of their votes on the occasion of elections. In this strangely-complicated condition of affairs, the only real restraint on government is public opinion, expressed through the medium of the newspaper press and public meetings. Without these two qualifying elements, the government and legislature would be, not only in name, but in character, a powerful oligarchy. As the case is, the restraint, though clumsy, is, on the whole, efficacious; and therefore, with all its errors and anomalies, the constitution is one of the most favourable to civil liberty. The very weakness of the executive, as respects the means of keeping its place, and its obligation to conciliate parties, is highly favourable to popular freedom. In no monarchy on the face of the earth is the executive so liberal—that is, interferes so little with private conduct. Under its administration the following important conditions are secured:—Liberty of speech within constitutional limits; a similar liberty of the press in all its departments; liberty of personal locomotion, no passports being required; liberty of carrying on almost every branch of trade without inquiry or license; liberty of meeting in masses to be instructed by lectures on political or other subjects; liberty of meeting to discuss any political topic, general or local; liberty of presenting petitions to parliament and memorials to the crown; religious toleration, and liberty for the performance of all forms of worship; liberty of setting up schools to instruct pupils in any branch of learning; protection from the law to life and property, without respect of person; privilege of trial by jury, and of forcing on a trial for any alleged offence; privilege of being held as innocent till proved to be guilty; incorruptibility of judges, these being no way exposed to intimidation either from power or popular prejudice. To these great bulwarks of civil liberty may be added the absence of military conscription; the non-existence of fortified or walled towns; the promptitude with which riotous proceedings are quashed and the peace preserved; and the absence of any restriction to prevent the most humble individual from rising to the highest rank and consideration. The drawbacks on all these advantages may be comprised in the following circumstances:—The existence of a set of laws so complex as to be unintelligible, and so expensive in administration, that legal redress, as far as private interests are concerned, is almost beyond the reach of the lower classes; certain restrictions on free commercial intercourse with foreign nations; the too prevailing treatment of all great questions in parliament with reference to classes instead of to the whole people; and lastly, the absence of a national system of education, which might in time elevate the minds and morals of the people, and altogether produce a more wholesome social condition. Fortunately, these circumstances are all of a nature which admit of amendment; and they will, as a matter of course, be amended, as *public opinion, enlightened by knowledge*, is brought to bear upon them.

#### Republics.

A republic or commonwealth is a form of government in which the people, or at least a large portion of them, are acknowledgedly the source of power, and have the direct appointment of the officers of the legislature and executive. There are few of this class of governments in existence. The only republics worthy of the name in Europe [we lay aside consideration of the untried, and, we may say, yet unconstituted republic of France] are those of the Swiss cantons; each of which is a territory of generally a few square miles in size, and inhabited by a few thousands of people, chiefly engaged in husbandry. In these cantons there are no great properties, and no families equivalent to our landed gentry. There are some wealthy and intelligent merchants in the large towns; but the bulk of the population are a hard-toiling race of small farmers,

## CONSTITUTION OF SOCIETY—GOVERNMENT.

and little is seen above a condition of mean mediocrity. The legislative and executive functions are conducted in accordance with this state of things. Some of the laws are contemptible, from the narrow-minded views they exhibit—such as those in some cantons to prevent dancing, and to prevent the purchase of houses or land by strangers; but other enactments, particularly as to freedom of trade, are much to be commended. These republics, centering in a general diet or congress, are greatly under the influence of Austria and other monarchies, by which, indeed, they are in a great measure tolerated only from mutual jealousy, and because the country is in some places almost inaccessible to hostile invasion. A constant drainage of the Swiss overplus population into France and to North America, helps to avert the catastrophe of a universal degradation to semi-pauperism.

On the continent of America, various republics have been founded on the wreck of the colonial institutions of Europe. The principal is the United States of North America, now upwards of half a century old. The form of the legislature and executive is very nearly that of England; the main difference being an elective President as chief magistrate, instead of a hereditary sovereign, and the appointment of judicial and other functionaries by the people, instead of by the crown. The country is not one, but an aggregation of republics; each state being independent of the others as respects internal management. The power of legislation for the States, in their united character, is vested in a House of Representatives and a Senate, jointly forming a Congress. The House of Representatives is composed of members chosen every second year by the people of the United States. The electors in each state are required to have the qualifications requisite in the electors of the most numerous branch of the state legislature. Representatives are apportioned among the several states of the Union according to their respective numbers, which are determined by adding to the whole number of free persons (including those bound to serve for a term of years, and excluding Indians not taxed) three-fifths of all other persons. The House of Representatives consists of one member for every 77,700 persons in each state, estimated according to this rule: the enumeration is made by a general census taken every ten years. No person is eligible as representative who has not completed his twenty-fifth year, and been seven years a citizen of the United States, and who is not, when elected, resident in the state for which he is chosen. The Senate of the United States is composed of two senators from each state, elected by the legislature thereof for six years. One-third of the Senate goes out, and is replaced by a new election every two years. A senator must be thirty years of age, nine years a citizen, and resident in the state for which he is elected. All members, both of the general and state legislatures, are paid for their services.

The President is elected by the whole people, for a term of four years: at the close of that period he may be re-elected; and, with the exception of three, all the presidents of the United States have been re-elected for a second term. Each state appoints a certain number of electors, who meet in their respective states, to vote for President and Vice-President, one of whom at least shall not be an inhabitant of the state. In Delaware, South Carolina, and Tennessee, the legislature chooses the electors; in Maine and Maryland, electors are chosen by the people voting for one or more in each district; in all the rest of the states, they are chosen by a 'general ticket,' upon which the whole of the electors vote. The electors transmit sealed lists of all the persons voted for as President, and all those voted for as Vice-President, to the President of the Senate, who opens the lists, and counts the votes, in the presence of the Senate and House of Representatives. If for the person having the greatest number of votes for President, a majority of the whole electors have voted, he is declared President; if fewer, the House of Representatives elects by ballot one of the three who

stand highest on the list. If for the person having the most votes for Vice-President, a majority of all the electors have voted, he is declared Vice-President; if not, the Senate names one of the two who stand highest on the list. The President and Vice-President must be natural-born citizens, thirty-five years of age, and fourteen years resident within the United States. The principle of electing representatives to the state legislatures is almost that of universal suffrage; in most instances, every male citizen above twenty-one years of age who has resided a year in the state is an elector.

With an immensely large unoccupied territory, and general thinness of population, it is impossible to draw any just inference as to the stability of this still comparatively raw and untried republican government. It is suitable to the present condition of the country; but whether it will maintain this character after its population has become as dense as that of England, and great diversities of wealth and intelligence have arisen, is a question which time alone can determine. In the meanwhile, the general character of the executive is feeble. The people, in a sense, are masters of the law, and have it in their power (in virtue of elective privileges) to intimidate its officers, or absolutely to set them at defiance. In the middle and eastern states, the efficiency of government for the repression of crimes is about the same as in Great Britain; but in the western states neither life nor property is safe from popular outbreak. The prevalence of slavery in the southern states aggravates this evil: personal security in New Orleans is at a lower ebb than in Italy or Madrid. Still, with these drawbacks, the United States is a great nation, in which civil freedom is on a grand scale, and is worthy of the enlightened community which has established and supports it.

### Revolutions.

A revolution is the overthrow of a government by some kind of convulsion out of the usual course of law, and the establishment of a new one in its stead. Modern history contains several examples of revolutions:—The deposition of monarchy and execution of Charles I., and the establishment of a Commonwealth, with Cromwell as dictator, formed the greatest revolution which has occurred in England, though it is never spoken of under that definition. The change of dynasty in 1688, with the guarantee of a constitution, is referred to as *the Revolution*, and no doubt it was the commencement of a new system of government. This revolution had the singular merit of being effected with little or no violence. The revolt of the American colonies, and their assumption of independence, was a distinctly marked revolution, effected by military force, and crowned with a degree of success which astonished Europe. It was shortly followed by the revolution in France in 1789, to the violence and consequences of which no parallel is found in history.

Revolutions are almost invariably a result of misgovernment. Tenaciously clinging to old usages, and opposing themselves to every species of equitable reform required by alterations in society, governments sometimes, as in the foregoing instances, become so repugnant to the feelings of the nation, that at length a rebellion ensues, and if successful, it becomes a revolution. The revolution which placed Cromwell at the head of affairs in England, originated in Charles I. levying taxes without the concurrence of parliament. The revolution of 1688 was caused by James II. assuming arbitrary powers vexing to the nation. The American revolution occurred in consequence of government imposing taxes on the colonists, while they were not represented in parliament, and therefore in violation of the constitutional maxim of—no taxation without representation. The cause of the French Revolution, in 1789, was an entire disorder in society; but it was precipitated by the refusal of the clergy and nobility to contribute any share whatever of the national taxes. A timely concession on the part of these bodies to aid the declining finances, by giving up a portion of their unjust

exemptions from taxation, would probably have averted the terrible calamity which ensued.

From every revolution which has occurred, all governments may learn the valuable lesson of acting with a prudent regard to constantly changing circumstances and feelings. Without yielding to every clamour, it is their duty and interest to adapt themselves to the progressive views of mankind; graciously advancing with the intelligence of the age, and not frantically, as has been too often the case, rousing a public indignation, which perhaps may lay them in ruins. Lessons equally useful, however, may be learned by the people from revolutions. To step in the slightest degree beyond the limits of constitutional law, and assume an attitude hostile to government, is always dangerous in the extreme—treasonable if defeated, and perhaps productive of unspeakable horrors if successful. Judging from the Cromwellian and the French Revolution, besides some successful revolts of lesser note, it would appear that a revolution in general circumstances runs a certain specific course. First, the old government is overthrown, and one thought to be more liberal is established. Second, the new government being composed of men who acted from a conscientious conviction of evils to be redressed, is soon found not to go far enough in its measures; it is accused of being too moderate, and is overthrown. Third, a violent set of men, animated by feelings of vengeance, and professing boundless liberality, construct a fresh government. Fourth, anarchy sooner or later ensues, the nation is in universal disorder, and life and property are no longer secure. Fifth, out of the convulsion arises an individual, who, by his military genius, conquers inferior demagogues, and brings back a degree of tranquillity at which every one rejoices. Sixth, this tranquillity is speedily found to be a military despotism: a Cromwell or a Napoleon is at the head of affairs. And, brought to this condition, a long course of suffering is endured before the nation returns to the constitutional point whence it set out. Varied according to circumstances, such is likely to be the progress of every revolution occurring from heedless, though well-intentioned, democratic invasion. An expectation that the original movers of a revolution will be suffered to conduct it to a conclusion, is pretty nearly hopeless. The agitation brings all sorts of wild schemers into play, and one party after another is remorselessly trampled down in the contest.

On this subject, which cannot be considered with too much calmness, Alison has the following observations; he is referring to the consequences of the French Revolution:—'Upon the occurrence of a revolution, the working-classes are the first to suffer, because they have no stock to maintain themselves during a period of adversity, and being wholly dependent on the daily wages of labour, are the earliest victims of the catastrophe which has interrupted it. It is this immediate effect of a revolution, in spreading misery through the labouring poor, which in the general case renders its march irresistible, when not arrested in the outset by a firm combination of all the holders of property, and precipitates society into a series of convulsions, from which it can hardly emerge without the destruction of the existing generation. The shock given to credit, the stoppage to speculation, the contraction to expenditure, is so excessive, that the lower orders are immediately involved in distress; and the same causes which increase their discontent, and augment their disposition to revolt, disable government, by the rapid fall of the revenue, either from administering relief or exerting force. The consequence is, that fresh insurrections take place; more extravagant and levelling doctrines become popular; a lower but more energetic class rises to the head of affairs; desperate measures of finance are adopted—the public expenditure is increased, while the national income is diminished; and, after a succession of vain attempts to avoid the catastrophe, national bankruptcy takes place, and the accumulations of ages are swept off in a general public and private

insolvency.' Besides an utter annihilation of private resources, the revolution in France led to the judicial murder or massacre of upwards of a million of the inhabitants; the bulk of those destroyed being of the lower and middle classes, notwithstanding that from these ranks (some of the judges had been criminals in the galleys) the tribunals and assemblies were composed. The French revolution of 1848, though less bloody, led, as is well known, to the prostration of trade, the ruin of many families, and, in general, great suffering.

#### Concluding Remarks.

In considering the nature and supposed influence of different forms of government, of which the preceding notices afford an example, it is important to guard ourselves against the too common error of mistaking names for things. A despotism has been described as the government of an irresponsible individual; and a republic as a government formed by the concurrence of the whole people. We should, however, be liable to commit an error, did we at once rush to the conclusion, that a despotism was invariably, and in its nature, tyrannical; and that a republic was as certain to be in every instance tolerant and commendable. It may happen that a despotism is really the most liberal and satisfactory of the two. This will occur when the despot is an intelligent and benevolent man. Instead of tormenting his subjects, he will take a pleasure in seeing them happy and prosperous; while by a sleepless and undistracted vigilance, he will conduct the government with a degree of firmness and efficiency not to be equalled by a miscellaneous-composed body. Such a beneficent government as this is said to be *paternal*; the sovereign acting as if he were the father and guardian of his people. Could it be possible to secure a continuance of sovereigns of this character, we might almost arrive at the conviction that despotisms were the best forms of government; but unfortunately there is no security on this score; an evil may follow a well-disposed ruler, and suddenly the nation may be thrown into confusion. On this account it should be the object of despotisms of the paternal character to prepare the people for the degree of self-government incidental to a constitutional monarchy; and having done so, to grant a constitution which will insure good government on a permanent basis.

That republics may be liberal and tolerant only in name, we have too many examples in history. Not to go farther back than the French Revolution of 1789-93, what despotism ever equalled, or came within many degrees of, the republican Convention, which for years oppressed and deluged France in blood! Not even the tyranny of Nero or Caligula could be compared to the disregard of all public and private rights manifested by that iniquitous and popularly-constituted body. The weak point in all republics is, that the most noisy and forward, who are usually the most ignorant, gain the ascendancy, and, under colour of constitutional privilege, tyrannise over the more quietly disposed and intelligent. This is exemplified to a considerable extent in the United States of America, and on a smaller scale in many popularly-constituted bodies in Great Britain. Among these bodies, a handful of noisy demagogues is often observed to carry measures by the mere force of clamour; and as the measures so carried are publicly announced as the doings of the whole body, it actually happens that men, under the shelter of an association, may be exempt from responsibility, and commit the most tyrannical actions. In the presbytery meetings of the Scottish church, measures are frequently carried by this means which no bishop on his own responsibility would dare to enjoin. A republican government, therefore, with all the semblance of a popular constitution, may prove far more unscrupulous than the most stern despotism ever framed. All this we mention, in order to put people on their guard against the illusions of a name. Let it be remembered that government is a complex machine, fulfilling a

## CONSTITUTION OF SOCIETY—GOVERNMENT.

wide variety of purposes, and that it is to be judged of less from the precise nature of its construction, than the quality of the work it performs. Another conclusion we arrive at is—That good government, although it certainly promotes the civilisation of a country, is much more its consequence than its cause; and that attention to the conduct and constitution of government, although a duty of the citizen, is only one of many public duties not less important and necessary both to the general wellbeing of society and the happiness of the individual.

### GOVERNMENT ADMINISTRATION.

Whatever be the form of government, it requires to be conducted by a set of functionaries capable of superintending the different branches of the public service. The chief officials at the head of affairs, and who act as the cabinet council of the sovereign, are usually styled *ministers*, a word signifying servants; and collectively they are called the *ministry*. The ministry are appointed by the sovereign, and in constitutional governments take on themselves the entire responsibility of all acts of the crown. The British ministry, which is constructed on no broad principle, but merely a result of occasional additions or special circumstances, is as follows:—1. First Lord of the Treasury; 2. Lord High Chancellor; 3. Chancellor of the Exchequer; 4. Secretary of State for Foreign Affairs; 5. Secretary of State for the Colonial Department; 6. Secretary of State for the Home Department; 7. President of the Council; 8. Lord Privy Seal; 9. First Lord of the Admiralty; 10. President of the Board of Control; 11. Chancellor of the Duchy of Lancaster; 12. First Commissioner of Land Revenue; 13. Secretary at War; 14. Commander-in-Chief. Such, in general, compose the cabinet; but there are nearly twenty other ministers—as Postmaster-General; Lord Chamberlain; President of the Board of Trade, &c.; and occasionally several of these are included in the cabinet, while one or two of those above specified are excluded. There is, in short, no distinctly-settled ministry in England. The whole affair is a matter of arrangement at each change of ministry.

The Secretary of State for the Home Department may be said to stand at the head of the executive as far as the internal affairs of the country are concerned. The appointment of judges, sheriffs, and other functionaries is in his hands. Military affairs come under the jurisdiction of the Secretary at War and Commander-in-Chief. The royal navy is similarly regulated by the First Lord of the Admiralty, and other members composing his council. In the matter of the church, education, and some other things, there is no distinct ministerial management. The finances come under the cognisance and responsibility of the Chancellor of the Exchequer.

For the sake of local administration, the country is divided into counties, divisions anciently under the charge of earls or counts, but now committed to sheriffs and other officers. The *sheriff*, however, is a functionary of old standing. The title is derived from *shire* and *reeve*—the reeve of the shire. Reeve is an old title for an officer of justice inferior in rank to an alderman, and is derived from the Anglo-Saxon term *gerefa*. In Scotland, the sheriff of a county is a judge ordinary of his bounds, besides being an executor of writs issuing from the crown. Towns possessing burgh privileges are exempted from the administration of sheriffs, and are governed by town-councils, including a burgh magistracy—such councils being annually elected by the ten-pound parliamentary voters or qualified inhabitants. The chief magistrate of a town in England is entitled *Mayor*, in Scotland *Provost*. In the principal cities only the prefix *Lord* is added. In towns, and also in the rural districts, there is a miscellaneous magistracy, styled *Justices-of-peace*, who are nominated by the crown, and who possess a certain jurisdiction in civil and criminal matters.

When an administration is radiated by a gradation of office, from the head functionaries downwards, it is

said to be a *centralised government*; for everything centres in the chief authority. The British is the least central of any government in Europe, as it leaves much of the subordinate administration to authorities popularly chosen. In some respects this is advantageous, but in others it is detrimental to the general welfare: in certain towns, for example, the popularly-elected authorities are quite unqualified for their duties, and systematically oppose improvements which it ought to be their duty to encourage.

The French, with less civil liberty than the English, enjoy a system of administration the most perfect in the world; it possesses some popular elements, but is thoroughly central. The ministry, as existing under the monarchical régime, consisted of—1. The Minister of the Interior; 2. Minister of Finance; 3. Keeper of the Seals and Minister of Justice; 4. Minister of Public Instruction and Ecclesiastical Affairs; 5. Minister of Commerce and Public Works; 6. Trade and Agriculture; 7. Minister of Marine and the Colonies; 8. Minister of War; 9. Minister of Foreign Affairs. Each of these is at the head of a department which is ramified over the whole kingdom and dependencies. From the Minister of the Interior down to a justice of peace there is an exact gradation, and through the whole a channel of intelligence is kept up. The prefects and sub-prefects of departments, the mayors, &c. are all in direct communication with their great chief in Paris. In England, the Secretary of State may have no knowledge of a remote magistrate; he probably has a difficulty in discovering his name; but in France, every functionary is known to the central government, and amenable to challenge. One advantage of this is, that the most exact body of information on any local subject can be at all times procured, without resorting to the clumsy and expensive expedient of appointing commissions. In France, also, the people enjoy the great advantage of a distinct and uniform body of laws, administered by a series of courts of precisely the same nature all over the country.

### Diplomacy

Is in all countries a separate branch of administration, and is that which relates to intercourse with foreign powers. The persons deputed to act as foreign ministers are of several classes. Those of the highest class, called *ambassadors*, are not merely the agents of their governments, but represent their sovereign personally, and receive honours and enjoy privileges accordingly. The second class are envoys extraordinary and ministers plenipotentiary, and *chargés d'affaires*. A third class are called residents; and next to them are consuls. Consuls, however, are confined in their duties to commercial affairs, and conduct no correspondence in relation to state policy; yet, along with the whole ambassadorial class, they are expected to succour all subjects of the power which they represent, and facilitate their journey as to passports, &c.

Ambassadors (to quote from the 'Conversations Lexicon'), and even ministers plenipotentiary, have young gentlemen with them called *attachés*, who have no particular charge, but merely this title, to connect them with the legation, and to give them thus admission into the highest society. Sometimes they are sons of noble families, who are preparing themselves for diplomatic offices, but think it beneath their dignity to accept an appointment as secretary of legation. The suit of ambassadors always includes more individuals than the business of the embassy requires, a certain degree of pomp being considered necessary. An ambassador has generally three, always two secretaries of legation; other ministers often but one. A foreign minister receives letters of credence from his court, which, after having delivered an attested copy of it to the Secretary of State, he gives himself to the monarch, or head of the government—if he is an ambassador, in a public audience; if not, in a private audience. After the reception of the credentials, the minister is said to be acknowledged. In some countries he puts the arms

of his nation or sovereign on his mansion. After his credentials have been received, he makes formal visits to the other ambassadors, to be recognised by them as such. From the moment that a minister enters the territory of the sovereign to whom he is sent, his person is held sacred and inviolable, and he acquires important privileges. To these belongs, first of all, his freedom from territorial restrictions; that is, he is not regarded as an inhabitant of the country; but his person, suite, house, equipage, &c. are considered as never having left the country to which he belongs, and as being without the jurisdiction of that in which he actually resides. From this follows the freedom of foreign ministers from the civil and criminal law; and the same applies to their suite; and all property belonging to him as minister is free from all taxes, &c. No common police-officer, tax-gatherer, or other public servant can enter his hotel and make inquisition, as in the house of a private citizen. One of the especial privileges of ambassadors is that of worshipping according to the forms of their own religion in countries where their religion is not tolerated. A minister often voluntarily leaves a court, without being recalled, when he thinks he suffers personal injuries, contrary to the laws of nations. There are cases, however, in which a minister is compelled to leave a court, when it is termed a *removal*. In general, an embassy is considered as ended from the moment when the minister shows his letters of recall, or receives his passports for his journey home. When these are furnished him, he must leave the country; but his person remains inviolable even in case of war, and he is allowed to retire unmolested. The same inviolability of person is enjoyed in the other European states, although only in time of peace, by couriers and expresses, as also by persons who, without any public character as envoys, are intrusted by their governments with the transaction of affairs of importance, and requiring secrecy and despatch; but these are not allowed to assume the state of a minister, and, in their relations to other citizens, are regarded as private persons merely.

#### Forces.

Every government employs force in the execution of its orders, or in defence of its rights. This force is in two departments, civil and military. The civil force is comprehended in constables and other functionaries usually employed in the execution of legal objects, in the maintenance of public peace, and in the enforcement of municipal regulations. Military force is quite a different thing: it is an organisation of men armed with weapons capable of inflicting wounds and death. In forces of this latter kind are included an army and a navy. Regularly-formed armies are of great antiquity. All nations, from the beginning of the world, appear to have required, or at all events used, military forces; in other words, they maintained and defended themselves by violence, and by violence they conquered each other. Hence war, or a period of fighting, may be said to have had an almost unbroken existence from the earliest dawn of history.

In the present day, with all its enlightenment, every civilised community less or more feels itself obliged to maintain an army. In some countries the regular or standing army is aided by an additional force, in the form of a militia or national guard, which is an armed citizenship. A regular army embraces three departments—infantry, or foot soldiers, cavalry, or horse soldiers, and artillery, or ordnance. Along with a royal navy—men fighting in ships—the cost of the military array in the United Kingdom is about £18,000,000 annually, and occupies the services of nearly 300,000 men. How far this enormous force could be reduced, consistently with the preservation of the empire in all its parts, is one of the most important questions of the day. The army is governed by rigorous laws of its own, so as to maintain high military discipline, and bring the whole body into an obedience resembling that of a machine. An army is immediately governed by

a commander-in-chief, generals of division, and subordinate officers. A regiment, which may consist of 1000 men, is under the charge of a colonel and lieutenant-colonel; next in subordination is a major, a captain, a lieutenant, and ensign. Beneath are the non-commissioned officers, including sergeants and corporals. Every regiment is dressed in a particular uniform; and several of them differ also in the style and weight of their accoutrements. In taking the field against an enemy, an army almost always requires to consist of a due proportion of foot, horse, and artillery; for each assists the other. The general use of the cavalry is to dash in and cut up the parts of a regiment already broken and dismayed by the fire of artillery. The royal navy consists of vessels of various sizes and construction, equipped and commanded as already explained under MARITIME CONVEYANCE, in Volume I. In conclusion, it may be remarked that in modern warfare the object is less to kill than disperse and terrify into subjection; and therefore, among civilised nations, mercy is always shown when asked.

#### HERALDRY—RANKS—TITLES.

Heraldry is the science, so called, of figurative representations, designed as emblematic of rank and honourable achievements. The origin of the word *herald* is uncertain; the most plausible conjecture is, that it is from the German *heer*, an army, and *ald*, a servant—the servant or messenger of an army. This derivation would at least pretty well agree with the nature of the office of herald, which is that of messenger, or envoy, or crier, of a royal personage.

Among the nations of antiquity, it was customary for armies to be distinguished by particular standards, and warriors by emblematic devices on their shields. This was a rudimentary kind of heraldry. The cultivation of such devices, however, did not attain a settled and regular form, or rise to the dignity of a science, till the ages which succeeded to the dismemberment of the Roman Empire. Europe was now intruded on, and taken possession of, by conquering hordes, led by military chieftains. This was the commencement of the feudal system. Each leader or king gave portions of the conquered lands to his captains or nobles, on condition that they should support him in war. These nobles, again, imparted lesser shares of the lands on the like condition; and thus, down and down, the whole of society consisted of military retainers, depending ultimately on the sovereign, who was deemed the great fountain of honour, the source of all authority and distinction. In France, Germany, Italy, England, Scotland, and some other countries, the same kind of feudal tenure prevailed.

Feudal usages led to heraldry. Everywhere there was fighting. Armies required standards; and knights assumed devices emblematic of their achievements. The parties who regulated these insignia were the royal heralds; and hence the term heraldry. As heralds travelled from country to country with armies, or with the kings their masters, they gradually formed a fraternity, who took pride in fixing an exact and uniform code of emblems in reference to particular circumstances. As feudalism advanced, and became refined, so did heraldry; and it may be said to have attained its highest glories among the Anglo-Normans shortly after the Conquest.

All the devices of heraldry bear a reference to weapons of war, or arms; and as the shield was the subject of emblazonment in actual combat, so is it the chief object of heraldic illustration. A complete set of devices is called a coat of arms, which we shall describe, commencing with the shield.

A shield, in heraldry, is called an *escutcheon* (Lat. *scutum*), which serves as a field whereon to portray the symbolic charges or bearings. The dignity of these charges is indicated by the situation in which they are placed. As the head of a man is supposed to be more dignified than his feet, so is the upper central

HERALDRY—RANKS—TITLES.

part of a shield more dignified than the parts beneath. Heraldic distinguish nine points in escutcheons, differing in honour. The letters in the accompanying figure show the situations of these points. A is called the middle chief; B, dexter chief; C, sinister chief; D, honour point; E, fess point; F, nombrill point; G, base point; H, dexter base; I, sinister base. These, and the greater number of heraldic terms which follow, are from the Norman-French language. *Tinctures* are the next species of distinctions. *Tinctures* signify the colours of shields. These colours, however, include metals and furs. Under this head is Gold called *Or*; and Silver called *Argent*; Red called *Gules*; Blue, *Azur*; Black, *Sable*; Green, *Vert*; and Purple, *Purpure*; Ermine and *Vair* are the furs. Each of these tinctures (in literature) is signified by a peculiar marking on the shield, or, as in the case of argent, by being left blank. A gradation of dignity from *or* down to *vair* is imported by the respective tinctures. The following escutcheons represent the distinctive markings of the principal or prime tinctures:—

*Honourable Ordinaries* are the next kind of markings on shields. They resemble belts drawn across, or other forms projected on the escutcheons; and are called the *chief*, the *pale*, the *bend*, the *bend sinister*, the *chevron*, the *pile*, the *cross*, and the *saltier*. We present a figure of the *bend*—which extends from the dexter chief to the sinister base, of the *chevron*, and of the *cross*:—

Next come the *partitions*. These are single lines dividing the escutcheon in a variety of ways, each, like everything else, indicative of a quality in the bearer. By these lines the escutcheon is said to be *party per pale*, *per bend*, *per fess*, *per chevron*, *per pile*, *per cross*, or *per saltier*. The annexed figure imports party per pale. A similar line horizontally across the centre indicates party per fess.

There are likewise angular lines like the teeth of a saw, and curved and notched lines, each with its distinct name, as *embattled*, *indented*, *marched*, *engrailed*, *inverted*, *wavy*, *nebuly*, *dancette*, *raguled*, *dim-tailed*, *radiant*, &c. The accompanying figure represents party per bend embattled.

*Lesser or sub-ordinaries* consist of double or triple straight lines, denominated *bendlets*, *pallets*, *bars*, and *chevronels*. Another kind of markings in the escutcheon are lozenges, chequered crossings, &c. Next we have combinations of the preceding figures, one surmounting or blended with the other. Such combinations usually refer to a union of family or national emblems. The union-jack or ensign of the United Kingdom is an example. For England it is argent, or cross gules; for Scotland, azure, or saltier argent; and for Ireland, argent, or saltier gules. Heraldic describe or emblazon the combinations thus:—'Azure, the crosses saltier of St Andrew and St Patrick quarterly per saltier, counterchanged argent and gules; the latter fimbriated of the second; surmounted by the cross of St George of the Third, fimbriated as the saltier.'

The next step in heraldry is putting animals, or parts of animals, on escutcheons, in order to convey an allegorical meaning. The attitudes of the animals also form distinct significations. When a lion is rearing on its hind-legs with its face in profile, it is said to be *rampant*. If the face is turned frontways, it is denominated *guardant*; if the head be turned backwards, it is *reguardant*. When the animal is walking, it is said to be *passant*; but if the face be frontways, it is denominated *passant guardant*. The lion borne in the arms of Scotland is thus emblazoned:—'Or, a lion rampant gules;' that is, a red lion rearing on a golden shield.

'The ruddy lion rampt in gold.'

In the royal arms of England are seen 'gules, three lions passant guardant in pale.' When part of an animal is represented as cut off straight, it is said to be *couped*; if seemingly torn off, it is *erased*. When an animal is represented as standing and looking in front, it is said to be *at gaze*; if the animal is represented in its natural colour, it is described as *proper*. A stag with horns is said to be *attired*. An eagle whose wings and legs are spread out, is said to be *displayed*. Salmon represented swimming are described as *naissant*. A tree torn up by the roots is *eradicated*. Wild men, fabulous animals, hands, legs, flowers, heavenly bodies, shells, daggers, tears, castles, ships, anchors, implements of various kinds, crosses of all imaginable shapes, all form emblems in heraldry, each with its distinctive appellation and meaning.

Over the shield, in heraldry, a *mantle*, or species of drapery, in wavy folds, is usually thrown. This is a decoration, having reference to the mantle of a knight in the field of battle: the more curled and contorted that the decoration appears, so is it implied that the mantle was torn and mutilated in the strife of arms. Above the mantle is depicted the *crest*. Crests were originally cognisances worn on the top of the helmet, in order to distinguish a warrior in the confusion of a battle. Sprigs of certain plants, feathers, representations of birds, heads, and other parts of animals, &c. were used as crests. The crest of the Earls of Warwick was a muzzled and chained bear, holding a ragged staff, still well known. In heraldry, the figure forming the crest usually rests on a *wreath*, or, more properly, a portion of what originally was a wreath. Wreaths of twisted ribbon, laurel, &c. were bestowed by ladies on favourite knights, and borne by them on their helmets; hence the emblematic wreath in heraldry.

Figures of *coronets* are employed to support the crests of noble families. The coronets differ in shape and in richness of decoration, according to the quality of the bearer. The crown of a sovereign, with its arches centering in a point at the top, is well known. The coronet of a duke has a row of oak leaves in gold round the fillet or band; that of a marquis has pearls placed alternately with the leaves; that of an earl has points raised between the leaves, with pearls on the top of the points;

that of a viscount has only pearls closely set; and that of a baron has a lesser number of pearls, with wider intervals between.

It was the practice at tournaments for the pages and esquires of knights to guard their shields, and for this purpose they dressed themselves in a fantastic manner—as griffins, and other animals, &c. From this originated the custom in heraldry of giving supporters to escutcheons. The supporters of the royal arms of Scotland are two unicorns; those of the British royal arms are a lion and a unicorn. Supporters are borne only by royal or noble houses. Every coat of arms has a motto inscribed on a roll of ribbon. Mottos originated in the war-cries of knights, also in exclamations made on particular occasions. They are for the most part in Latin or French. The motto for the British royal arms is 'Dieu et mon Droit'—'God and my right.'

A hatchment is a species of funeral escutcheon, suspended in front of a house to mark the decease of one of its inmates. These escutcheons are always drawn up with heraldic precision, so as to indicate, by the form and accompaniments of the field and the colour of the ground of the hatchment, the sex, position, and rank of the deceased. Thus, if the death be of a male, the right side of the board is painted black; if of a female, the left—and so on.

In modern times, in England, coats of arms are granted only by the sovereign, through the agency of the Herald's College; in Scotland, by the Lord Lyon, king-at-arms, or his officers; and in either case, only on cause shown, and on payment of a fee. Latterly, the science has so much degenerated in the hands of the above functionaries, that little discrimination is exercised in dispensing either crests or escutcheons; what is worse, figures of ordinary objects are sometimes allowed to be displayed, having reference to the profession of the bearer. This is a perversion of heraldry, which is the science of emblems, not the blazonry of vulgar representations. In Britain, the use of armorial bearings in any form renders the wearer liable to a special annual taxation.

#### Ranks—Titles.

In Great Britain, society is composed of three estates, called the three estates of the realm—1, The sovereign; 2, The nobility or peerage; 3, The commons or people. This division, which originated under feudalism, gives a character to British manners and institutions, and admits of a considerable variety in rank and title.

To the sovereign, whether king or queen, is given the title of *Majesty*—as, His Majesty the King. This epithet is derived from the ancient Romans, by whom it was applied first to the whole people in a collective sense, and afterwards to the consuls and dictators. It was not used in modern Europe till the treaty of Cambrey, 1526, when it was given to the Emperor Charles V. Since that period, it has been applied to nearly all European monarchs. By the pope, the title of *Catholic Majesty* was given to the king of Spain; *Apostolic Majesty* to the king of Hungary; *Most Christian Majesty* to the king of France; and *Most Faithful Majesty* to the king of Portugal. Previous to the adoption of the term *Majesty* in England, the title of *Highness*, or *His Grace*, was taken by the monarchs. To princes is now usually given the title of *Highness*, or *Royal Highness*.

The nobility consists of five degrees—dukes, marquises, earls, viscounts, and barons. The title of *duke* is from the Latin *dux*, a leader, and signifies the leader of an army. It is as ancient as the early German tribes previous to Charlemagne. Of old, dukes were set over provinces or districts to regulate the military affairs, as lieutenants of the sovereign. Under the German empire, the dignity and power of the dukes became hereditary. In England, the first hereditary duke was the Black Prince, created by his father Edward III., in 1336. The rank and title of duke have long since been disconnected with office. To dukes is now given the title of *His Grace*.

*Marquis* is the next lowest rank. The title of mar-

quis, equivalent to margrave in Germany, was originally given to those officers whose duty it was to protect the frontiers or marches of the kingdom. It has long been only honorary. To marquises is given the title of *Most Noble*. *Earl* is the next degree of nobility. The title is from the old Saxon word *ehel*, or *car-ehel*, (gentle and noble), abbreviated to *car-el* or *earl*. It was the duty of an earl to exercise civil, and also military jurisdiction over the district committed to his charge; and as *count* is an equivalent term for earl, the districts superintended by the earls came to be called *counties*. To an earl is given the title of *Right Honourable*, and he is addressed as *His Lordship*. *Viscounts* were the earl's deputies—*vice comes* in Latin. To a viscount is also given the title of *Right Honourable*, and he is addressed as *His Lordship*. The office of earls and viscounts has long since passed into the hands of lord lieutenants and sheriffs.

*Barons* occupy the lowest degree of rank among the nobility. The title of baron implies mainly power, and after the Norman Conquest, was given to possessors of domains held of the sovereignty by feudal tenure; these domains were called *baronies*. A baron has the title of *Right Honourable*, and he is usually spoken of as a *Lord*. The dignity of baron or lord is now given irrespective of territorial holdings.

Among the commons of the United Kingdom are likewise degrees of rank—*baronets*, *knights*, *esquires*, and the *people* at large. The title of baronet was created by James I. in 1611; the design of the king having been to institute an inferior order of nobility. No gentleman was admitted to the rank of baronet without becoming bound to maintain 'thirty foot soldiers in Ireland for the space of three years, after the rate of eightpence sterling of money of England by the day.' It was by this assistance that James was able to effect the plantation of Ulster with English and Scotch settlers. A similar order of baronets was projected by James for Scotland, called the Nova Scotia baronets; his design being, to reclaim the province of Nova Scotia with the money they paid for the dignity. This order of baronets, however, was not instituted till 1625 by Charles I. Baronets, as in the case of the nobility, are now created at the pleasure of the sovereign, and their rank is hereditary. There are, nevertheless, differences in the terms in which these honours are held; sometimes the patent creating a nobleman or baronet confines the honours to heirs male direct, and sometimes allows their transmission to heirs in collateral branches, through heirs female. A baronet places the prefix of *sir* to his name; his wife is legally styled *Dame*, but in ordinary speech she is called *Lady*.

Knighthood was a military distinction of the middle ages, conferred only on persons of honour, truth, and fidelity. Afterwards, different degrees of knighthood were created. In the present day, knighthood is an honour bestowed on civilians or others, in compliment, as is understood, for some distinguished service in literature, arts, or arms. It is not hereditary. A knight has the prefix of *sir* to his name. The title of *esquire* was originally given to the shield-bearers of knights—young candidates for the honour of knighthood. It is now so generally assumed, as to have pretty nearly lost all value as an honourable distinctive appellation.

*Master*, or its contraction *Mr.*, is the title given by courtesy to all persons whatsoever of an ordinary standing. *Master* is from the French *maître*, which is from the Latin *magister*. *Miss* or *Mrs* is from the French *maîtresse*. *Miss*, applied to an unmarried woman, is only a contraction of *mistress*, which used to be applied to young unmarried women as late as the beginning of the eighteenth century.

In England, with the advancement of intelligence, we may expect a gradual disuse of titles. At present, however, they do not appear to be on the decline; and what is more remarkable, there seems to be a strong love of titles, and even of heraldic insignia, among the citizens of the North American republic. How deeply are such fancies imbedded in human nature!

## HISTORY AND NATURE OF LAWS.

LAW may be defined as a system of regulations adopted in social communities for the general advantage, and on that account binding upon all the individuals constituting a community. Such regulations being absolutely essential to the existence of a social state, we may safely infer, that as soon as any portion of mankind advanced into that state, law began to exist. Its origin, being thus early, is necessarily obscure: we know extremely little of its history in any of the nations of antiquity besides Greece and Rome.

In Grecian history we find more than one well-known code of laws; but so limited and simple was their operation, and so little are they adapted to the wants of a complicated state of society, that they are to be looked upon rather as municipal regulations for the temporary government of a small knot of men, than as systems from which any additional hints are to be obtained to aid modern jurisprudence. It does not appear to have been in Greece—the source, as it was, of philosophy, literature, and art—that useful laws, applicable to the business of life, had their origin. The Phœnicians, of whose history and institutions we unfortunately know so little, seem to have been among the first to establish a general system of mercantile law, which their extensive commerce distributed abroad. To Rhodes, which can scarcely be considered a province of Greece, we owe the earliest regulations applicable to shipping. The law of average, or that by which the loss occasioned by throwing goods overboard to relieve a ship in distress is laid proportionally on the whole property saved (a most important branch of the commercial code of modern nations), had its origin in that state, and is still called the Rhodian law. There is the less importance, however, in the inquiry into the laws of early nations, since all of ancient law which continues to have any force in civilised Europe, has come to us through one channel—namely, the Roman law.

### ROMAN LAW, AND THE SYSTEMS DERIVED FROM IT.

Most European nations, being, as it were, the remoulded wrecks of the Roman Empire, have obtained the basis of their laws from that source. The Roman law is, therefore, by the common consent of Europe, denominated *The Civil Law*. In Europe there was but one other system at an early period, to combine with it. This was *The Feudal Law*, or that code of usages which had sprung up in European nations before they received the civil law. It is, after all, only in some countries that the feudal law exists: in other cases, the civil law has established a proportionate, and in some a preponderating influence. In Holland and Germany, the original purity of the principles of the civil law have been preserved with such zealous care, that the writings of the lawyers of those countries are quoted as authorities on the law of Rome. In Spain, the system has been grafted on the feudal law, and on some peculiar customs derived from the Moors. In France, previous to the Revolution, the civil and the feudal law were united, as in most other nations of Europe; and in the Code Napoleon, to which we shall hereafter more particularly advert, there are many regulations from the jurisprudence of Rome allowed to exist, or revived, while many of the feudal customs which were formerly so prominent are abolished. England distinguished herself from the other nations of Europe by rejecting the civil law as authority, but many of her institutions were derived from its spirit and practice. 'With all its imperfections,' says Sir William Jones, 'it is a most valuable mine of judicial knowledge; it gives law at this hour to the greatest part of Europe, and though few English lawyers dare make such an acknowledgment, it is the true source of nearly all our

English laws that are not of a feudal origin.' In Scotland, the Roman law has always been a special subject of study; and though the number of native decisions, the extent of statute-law, and the necessary adaptation of the system to a state of society very different from that in which Justinian promulgated his code, have rendered references to this source comparatively unfrequent, the civil law is still authority where the particular law of Scotland does not contradict it. It is a special object of study by the legal profession, and is the subject on which the members of the bar are first examined before they are admitted to practice. To complete the general outline of the influence of this system in modern Europe, it must be mentioned as the source of the canon law, which was created into a system by the Church of Rome, and still exists more or less, either separately or incorporated with other systems, in all countries where the papal authority was acknowledged. The law of nations, or international code, has been, by the common assent of civilised nations, derived from the law of Rome.

Writers have divided the legislative sources from which the laws of Rome spring into five. Among the first of these is generally classed the people, and the laws sanctioned by them are technically divided into the *Lex* or *Populiscitum*, and the *Plébiscitum*; the former including the acts of the whole people, the latter those of the plebeians convened by their tribunes. It would appear that, in the earlier periods of the monarchy, the authority of all classes was in this description of legislation tolerably equal. Servius Tullius, however, the sixth king, introduced the well-known divisions into centuries and classes, by which ninety-eight votes were secured to the first class, while ninety-five only were allotted to the remaining five, of which the lowest and most numerous possessed only one. The tribunes, who were officers chosen for the ostensible purpose of protecting the people from the tyranny of the aristocracy, were, by the exclusive and important power they possessed, again the means of restoring popular election. They procured the assembling of the people by tribes, in which their votes were given individually, and without the necessity of a property qualification. All popular legislation, however, soon disappeared with the authority of the emperors. Augustus, except in one instance, found the popular assemblies profoundly obedient, and under his successor they ceased to exist; so that long before the Roman laws had become the grand system of jurisprudence which they constituted under the auspices of Justinian, the popular source of legislation had been dried up.

The decrees of the senate (*Senatus consulta*) are another source of the Roman law. The legislative power of this body seems to have grown out of its judicial, which was at first its proper province. By the original constitution, the people alone were understood to be the makers of the laws, and their authority seems to have been gradually engrossed by the senate, the interference of which, from having been confined to mere advice and paternal assistance in legislation, gradually extended itself to that of making laws. It was not till the days of Tiberius that these decrees were publicly promulgated as laws; but the senate had by that time lost its independent authority, and become merely an instrument in the hands of the emperor. The proceedings of the senate were generally suggested by some public officer, as a minister of the crown now introduces a bill into parliament, and a majority decided for passing or rejecting. In later times it became the practice for the emperor to propose a new law, either by a message or letter laid before the senate, or by an oration delivered; and as there was no opposition intended or

permitted, the legislative body became the mere registrars of the monarch's will.

Another source of the civil law is the constitutions and rescripts of the emperors. At what time they commenced the practice of making laws without the nominal concurrence either of the senate or the people, is not very distinctly known. A passage in the Pandects, the authenticity of which, long doubted, has been confirmed by late discoveries, states that the will of the emperor is law, and that by a particular act, the people had conferred upon him all their own power, which was thenceforth absolutely to remain in his hands—one of those transactions under the guise of which rulers are so fond of concealing their lust of power, by representing as a free gift that which no one can venture to refuse. Hadrian is believed to be the first emperor who exercised the authority of a supreme legislator. The imperial laws were issued in a variety of forms. Sometimes there was a new constitution springing from the monarch's own creative mind—on another occasion he would give his imperial judgment on some nice speculative question of law dutifully submitted to his wisdom. Many of the imperial laws, however, were the decisions of the monarch in particular cases, the spirit of which was piously preserved by the lawyers of the age, as the best criterion for a general rule of action. In modern times, we associate with despotism a horror of innovation, and a desire to leave all institutions, whether expedient or hurtful, untouched. It was different in imperial Rome. The emperors were never tired of displaying the legislative produce of their own genius, or those which the prudent and courteous discoverers did not compete with them for the merit of suggesting. During four centuries, from Hadrian to Justinian, the manufacturing of legislation was in almost constant operation. Diocletian alone enacted 1200 new laws—a number that would do no discredit to a moderately long reign of a British monarch.

Edicts of the prætors are another, and not the least important source of Roman jurisprudence. Of these high magistrates there were different numbers at different times; but the supreme authority vested in two, one having jurisdiction over the city, the other over the provinces. The prætor held his office for a year; and as a provision against his adapting his judgments to his own personal views, the Cornelian law obliged him to issue a sort of proclamation at the commencement of his magistracy, embodying the general principles to which he should adhere in his judgments; and thus, at the moment when he was least acquainted with the duties of his office, he had to fix the plan on which he was to execute them. The prætor was not originally vested with legislative power—it arose in the exercise of his judicial authority. He was merely the interpreter of the laws; but when they seemed to him to be hard, or otherwise erroneous, he did not scruple to suspend or alter their execution. The prætorian law has been compared to the equity system in England—a distinct system of law, arising out of those instances in which it was necessary to give relief from the strict interpretation of the common law. The common law had fixed a particular rule; a case would arise in which its application would be very oppressive: the common law judges, bound by their system, could give no relief; but the chancellor took upon him to modify the evil, and his decision was followed in like cases. The system of the prætors was somewhat similar, with this difference, that as they had no judges to compete with who pursued a system of strict interpretation, their equity had rather a tendency to modify the common law than to raise a rival structure. 'The secret or probable wish of the dead,' says Gibbon, when illustrating the prætorian system, 'was suffered to prevail over the order of succession and the forms of testaments; and the claimant, who was excluded in the character of heir, accepted with equal pleasure from an indulgent prætor the possession of the goods of his late kinsman or benefactor. In the redress of private wrongs, compensations and fines were substituted to the obsolete

rigour of the Twelve Tables; time and space were annihilated by fanciful suppositions; and the plea of youth, or fraud, or violence, annulled the obligation, or excused the performance of an inconvenient contract.' With the expiry of his year of office, the edicts of the prætor ceased to be imperative; but they were still looked up to as precedents; and when they became venerable by long use, they were considered as part of the fixed law of the land. By an enactment of the Emperor Hadrian, called the 'Perpetual Edict,' this doubtful and fluctuating branch of the law—at least as much of it as the emperor chose to sanction—received what might be called the royal assent, and was incorporated with the other portions of the civil law as a distinct branch of the system.

In almost every nation which has passed gradually from barbarism to civilisation, many laws will be found to have come into existence without the direct interference of any legislature, and from no better defined origin than a habit on the part of the people of submitting to certain rules, or obeying the commands of certain individuals: it is, indeed, generally in this manner that legislatures have originated. A considerable portion of the Roman law was of this kind: it arose in custom, was handed down by tradition and practice, and called consuetudinary law. It is a disputed question, how far it was necessary that some competent authority should certify that the principle actually was an established portion of the ancient customs of the nation, before it could be safely acted upon as law. It is a peculiarity of the civil, as distinguished from the English jurisprudence, that, according to the former, a law may be tacitly abrogated by long disuse. In England, no law, however long forgotten, ceases to exist till it be repealed by the legislature.

The last fountain of Roman jurisprudence which we shall notice, is the *Responsa Prudentum*—literally, the answers of the wise men—the opinions of the sages of the law. It is difficult to conceive a state of society in which the opinions of legal writers, as to the interpretation of the law, will not have an influence. If a case occur in which the judge is uncertain as to the proper application of some enactment, where can he find a more suitable or a safer guide than in the opinion of some far-seeing lawyer, who has anticipated the case without knowing the parties, and who, consequently, cannot have proceeded on a bias to one or the other—a defect of which the judge, if he be the first to interpret the law, will be at least suspected? Even in England, where interference with the doctrines of the common law is so jealously opposed, the early commentators are the only authority for its provisions; and there is no doubt that they gave the hue of their own opinions to the doctrines they laid down. In Rome, however, where the profession of the law, instead of being a trade, conferred a high rank in society, the opinions of leading counsel had a much more extensive range. They not only interpreted, but they could create law, by suggesting how the decisions should proceed in imaginary cases. At an early period, the relation of lawyer and client was that of patron and dependant. Patricians alone could act as lawyers, and the science was involved in riddles to which they only possessed the key. The poor client was dependent on the good will of his lordly patron for such protection from oppression, whether through the law or otherwise, as the influence of the latter might enable him to afford. When population and transactions increased, and the laws, instead of a mystery, became a serious study, which depended more on laborious application than simple initiation, the profession was opened to plebeians. It became not an unusual case, at a still more advanced period, for the patron and lawyer to be separated; the former being chosen for his influence, the latter for his skill. The forms which regulated the intercourse between patron and client, however, still retained some relics of their origin; and it is a striking illustration of the influence which Roman jurisprudence has exercised over the human race, to find these still existing.

## HISTORY OF LAWS.

To this day, it is against all etiquette to bargain with a barrister for his work. The law gives him no claim for remuneration, which it kindly views as unworthy of the dignity of his profession; and it is usual to pay him beforehand for his legal assistance. On the other hand, though he has been paid beforehand, he cannot be compelled to perform any duty in return, for he is presumed to assist the client from his own free good will. In most other professions, it is the custom for the person employed to feel under a sort of obligation to the employer who has preferred him to others. This principle is reversed at the bar; for the person employed is the patron, and the employer the client.

But to return to the legislation of the sages of the law. During the commonwealth, whoever, by his superior sagacity or knowledge, could obtain deference for his opinions, might be said to be a manufacturer of laws. Under the earlier emperors, the privilege of promulgating authoritative opinions was confined to a limited number of lawyers, of equestrian rank, licensed by the government; but the profession was again thrown open to the public by Hadrian. The most brilliant era of legal wisdom commences within a short period of the decline of the republic, and terminates with the reign of Alexander Severus. Mucius Scaevola, the tutor of Cicero, was one of its earliest ornaments; and it included the celebrated juriconsults Paul, Ulpian, Papinian, Capito, and Labeo. The two last of these, who lived in the age of Augustus, were the founders of the two sects—the Proculians and Sabinians—into which the Roman lawyers were divided. The former advocated the doctrine that the laws should be amended at discretion, to meet circumstances as they occurred; the latter maintained the theory of their strict interpretation, be its inexpediency in the particular instance what it may. Capito, applying his doctrines to the inroads which the emperors were gradually making in the freedom of the republic, was a supporter of this species of innovation, and his followers were enrolled among the ready tools of despotism. Labeo sought to support the ancient freedom of the republic by an adherence to the letter of the old laws, and his sect became the champions of what may be termed constitutional freedom. The conflict is not unlike that which at one time existed in Britain between Lord Mansfield and Lord Camden; the former supporting, to a certain degree, an equitable, the latter, in all cases, a strict interpretation of the law.

Having now enumerated the principal sources of the Roman law, we may notice its remarkable epochs. The laws enacted during the reigns of the kings, although a curious subject of inquiry among antiquaries, exercised too little influence on the civil law, as handed down to modern Europe, to be of much practical importance. During the administration of the decemvirs, the celebrated laws of the Twelve Tables were adopted. The traditionary history connected with this code is, that the Roman government, conscious of the want of a proper legal system, sent commissioners to Greece, who, after studying the laws of that comparatively civilized nation, produced the Twelve Tables for the acceptance of the Romans. The tradition, like many others connected with the Roman history of the period, has not sufficient historical evidence to support it against its natural improbability. These laws, of which specimens are professed to be preserved, are written in a language so different from that of the classical writers of Rome, that they were to Cicero an object of much the same curiosity as the old Scottish acts were to Bacon. Like the first laws of other rude states, they are simple and brief in their enactments. The bankruptcy system—which has so sadly shocked several benevolent scholars, that they have endeavoured to explain it as a merely symbolical provision—is peculiarly sharp and effective. It enacts that the insolvent debtor shall be cut in pieces, and that his body shall be distributed among his creditors. When law became a science openly studied, the Twelve Tables became the subject of many commentaries. It was not, however, till the Romans had been

for some time degenerating, that those great collections of legislative wisdom which have come down to modern times were commenced. The first attempt to construct a code seems to have been the Perpetual Edict of Hadrian, already alluded to. Two private individuals, Gregorius and Hermogenes, appear to have collected the imperial constitutions into a system, or code, of which some fragments are still preserved. Nothing whatever is known of the biography of these compilers: it has not even been discovered in what reigns they respectively lived, though their labours received high commendation at the hands of Theodosius the Younger. Under this emperor the celebrated Theodosian Code was promulgated, in the year 438. The compilation of this body of laws was committed to eight individuals, who were allowed considerable latitude in explaining and abridging, and even in supplying deficiencies. It contains the legislative acts of sixteen emperors, from the year 312 to 438. Fragments of this code have been rescued from oblivion inch by inch, by modern scholars, whose labours, it may safely be calculated, have amounted to some twenty or thirty times more than those of the original compilers. The celebrated Godefroy of Geneva spent thirty years in the task; and within the last thirty years the discovery of some further fragments induced the celebrated Angelo Mai to study the Roman law for the purpose of editing them.

We may now notice those great collections of the legal wisdom of the Romans, to which the above may be considered only preparatory. In 529, ten commissioners, appointed by Justinian, prepared *The Code or Codex*, as it is termed, from the collections previously made, and the intermediate enactments. Soon after its promulgation, the emperor issued several new constitutions, and the whole were consolidated and reissued in 534. This great task was superintended by the celebrated Tribonian, whose eminent learning and discrimination, allied with untiring industry, but stained by the vices of corruption and partiality, have afforded a fruitful theme of praise and obloquy. This was by no means Tribonian's only labour. In the year 530, he was appointed the chief of a commission of sixteen, whose duty it was to cull the choice and useful passages from the authors of comments and opinions. The various authorities, which, we are told, would have made several camels' loads, were thus reduced within a compass which, if it do look somewhat formidable to the consulter, is still manageable. Such are the fifty books which constitute the celebrated 'Pandects,' or 'Digest' of the Roman law—a work without which modern Europe would have known but little of the subject. Along with Theophilus and Dorotheus, the indefatigable commissioner was able to prepare, in conjunction with this great digest of the law, an abridgment or manual of its leading principles, which bears the well-known name of 'The Institute.' This condensed and elegant little work was sanctioned by the emperor in 533. It has become the subject of innumerable comments, and has afforded the model on which the legal writers of most modern nations have desired to prepare their treatises. Justinian continued, during the remainder of his life, to promulgate new laws; and these, collected together under the title of '*Novellae*,' or '*Novels*,' form the remaining department of the '*corpus juris*,' or body of the civil law.

With Justinian we reach the climax of the Roman law; and to trace its farther progress in the Empire has been more a subject of curiosity to the antiquary than of importance to the lawyer. Some fragments by later commentators, chiefly in the Greek language, have been disinterred by zealous searchers. The Roman law was nominally respected by the northern conquerors of Rome. Alaric, king of the Visigoths, indeed, caused a compendium to be prepared for the use of his dominions, consisting chiefly of an abridgment of the codes of Gregorius, Hermogenes, and Theodosius. Towards the end of the ninth century, Basilus, emperor of the East, issued a new code, intended to supersede the labours of Tribonian, termed the '*Basilica*.'

In the dark ages, however much of the Roman law may have remained in practice, it had died away in literature, and was neither studied nor commented on. At the taking of Constantinople in the fifteenth century, only one copy of one of the Justinian labours, the *Novels*, seems to have been discovered. It was long believed, indeed, in the learned world, that from the period of the Basilica to the twelfth century, the very existence of the Roman law was among the things forgotten. The circumstances of its resuscitation were found in a traditional anecdote, that at the siege of Amalphi in 1137, some Pisan peasants discovered a complete copy of the Pandects among the plunder, the melodious language, comprehensive philosophy, and clear definitions of which, so charmed the readers of that barbarous age, that its contents were immediately devoured with avidity and propagated with zeal. In Florence, a manuscript is still preserved, said to be the identical book with which this anecdote is connected, taken at the siege of Pisa in 1406. The essence of the tradition has been disproved by late discoveries, which show that the civil law was known previously to the siege of Amalphi.

The real revival of the civil law is to be traced in the history of the universities. Of these, Paris, Bologna, and Leyden, took the lead in the department of jurisprudence. Contemporary with, or immediately after the siege of Amalphi, lectures were given on the Pandects in the university of Oxford, by a teacher of the name of Vacarius. For reasons which we shall have to state when we come to treat of the laws of England, the civil law, thus early commenced, never made much progress in England. Nor, although the civil law was so prominent a subject of professional study in Scotland, has that part of the empire done much to elucidate the science. Both England and Scotland, indeed, have produced writers on the civil law; but with one or two exceptions, the British jurists are not among those names which become familiar to the readers on the subject, from the frequent reference made to them by subsequent commentators. The earlier modern civilians followed three oracles—Bartolus, Baldus, and Accursius, whose works, it is believed, the most enthusiastic admirer of the study would not now peruse, and who probably retain their chief celebrity from having been targets for the wit of Rabelais. In the seventeenth century, more elegant and philosophical commentators followed, and the subject was pursued with zeal to the middle of the following century. A prodigious number of civil law books issued from the press during that period; and we have heard it asserted, that a complete collection of all the books published on the civil and canon law would make a library of two hundred thousand volumes. The labours of Godefroy alone are sufficient to damp the ardour of a modern literary collector; and there is perhaps no surer mode of comprehending what human patience and perseverance is capable of, than the contemplation of a civil law library. Holland has been profuse with great authorities—Grotius, Mattheus, Schulting, Noodt, Voet, and Huber, belonged to that country. Germany produced the philosophic jurist Puffendorf, and Heineccius, whose elementary works—as the clearest and most methodical of the commentaries—have been popular as class-books of civil law. Among modern investigators in this laborious science, the Germans have taken the lead.

To give a general outline of the Roman law, would be to describe the common principles of the majority of the codes of civilised mankind. Although the progress of commerce and manufactures has introduced a quantity of transactions—such, for instance, as bills of exchange—which the Roman lawgivers could never have contemplated, yet their system is the foundation of all the commercial laws of Europe—a circumstance which has probably facilitated the uniformity so necessary in transactions which involve inhabitants of different countries. From the same source, Scotland and the greater part of continental Europe have de-

rived a marriage law so different from the ceremonious system that prevails in England. Its leading principle is, that the consent of the parties alone is necessary to a valid marriage, and that when that is proved, nothing more is necessary; and that a child born between parties who are subsequently married, becomes legitimate by that act. The law of trusts and of the mutual rights and obligations of guardian and ward, have found their way more or less into every modern system, and even into the statute-law of England. Prescription, or the principle that claims are limited by the lapse of time, has come down to us from the Romans. The law of testaments, and the descent of movable property, is mainly derived from the same quarter. It is in the case of the tenure and transmission of land, indeed, that the person versed in modern systems will find himself least at home in the Roman, from the effect which the feudal institutions of the various nations of Europe have produced on that branch of the law. The subjection in which children were placed to their parents is apt to create surprise, even when compared with the strict filial etiquette of our own ancestors. A revolting feature of the *corpus juris* is the portion of legislation devoted to the subject of slavery and the property in slaves.

The Roman law has already been mentioned as the source of the law of nations, or, as it is more justly called, the *international law*, in modern Europe. It was quite natural that a system voluntarily adopted among nations for regulating their mutual intercourse, should be founded, to as great an extent as might be expedient, on the system of the internal laws which the majority of the nations had chosen to adopt. But the law of nations is perpetually varying with circumstances, and it is impossible to draw that distinct view of its nature and provisions which may be given of the laws of any particular state. It has been argued, indeed, that the term 'law' is improperly applied to the system. Wherever the term law is used, there is understood not only a regulation laid down, but a means of enforcing it in the hands of a superior power. The civil and criminal laws are enforced by the ordinary courts; the military law, by courts martial; the law of the church, by the ecclesiastical courts, &c. But who, it is said, is to be the judge to enforce the law between nations? When two nations have a dispute, and their power is equal, it remains undecided; if the one is much superior in strength to the other, it has matters its own way. In the late war, Great Britain maintained that she had a right to search all neutral vessels, for the purpose of ascertaining if they contained contraband goods or sheltered deserters. The smaller states were bound to submit; but America resisted, and the dispute occasioned a bloody war. So it probably will be again when the same claim is urged. Instead of being a fixed law applicable to all, the weak will have to obey, and the strong will resist. For the enforcement of any rules that may be called the law of nations, then, it is clear that there is no better sanction than this, that the powers which openly outrage them will call forth a degree of indignation on the part of the rest of the world which may prove dangerous. The partition of Poland, for instance, called forth the indignation of the rest of Europe; and it may be still a question whether the acquisition was a prudent one to the nations concerned. It is not to be supposed, however, that there are no courts where the law of nations is enforced. Each country in Europe has generally a court where its own views on the subject are laid down. England has, for instance, the prize jurisdiction of the Court of Admiralty, which is thus called a civil law court. During the late war, when Napoleon, by his Berlin decrees, declared Great Britain and her colonies in a state of blockade, and Britain retaliated by the orders in council on the rest of Europe, a multitude of cases where the ships of neutral powers had been seized for breach of neutrality were adjudged. And here a circumstance occurred which could not take place probably in any other country, that the view taken of the

## HISTORY OF LAWS.

law of nations by the judge was different from that taken by his government; for Lord Stowell declared that a blockade could not be held to exist by mere proclamation, but that there must be present on the spot an armament sufficient to enforce it.

One of the principal defects of the writings in the civil law, and one that renders the subject in a great measure unpopular at the present day, is the spirit of speculation with which they are imbued, and the extent to which they carry divisions and arrangements which are of no service in practice, and provide for wants purely hypothetical. The civilian in his study, shut out from the world, and ignorant of its pursuits, sets his brain at work to create the various exigencies of practical life to which the maxims of the institute were applicable, and to devise how they could be applied; but when his labours were brought to the light of day, it was found that the world in its practice, and he in his thoughts, had taken totally different routes, and that the one could not be the companion of the other. If a tailor make clothes with another man's cloth, to which of the two shall they belong? If an artist paint on another man's canvas, who shall be the proprietor of the picture? Such were among the subtleties discussed among the Roman jurists. In later days, when legislators have too much to do in keeping up with the practical demands of society to indulge in hypothetical law-making, such subjects would not be taken up until cases of difficulty actually occurred; and then, before deciding the abstract questions, it would probably be asked under what circumstances tailors are likely to make garments out of cloth which does not belong to them, or artists to paint on other people's canvas!

### THE CANON LAW.

The Canon Law is, properly speaking, the ecclesiastical law of the Roman Catholic Church. In its more limited acceptation, it may be called the by-laws of the church as a separate corporation; but its field widened with the influence of the hierarchy. It embraced many subjects of pure civil and municipal law, such as the distribution of property between married persons, succession, &c., by linking them with ecclesiastical matters; and thus the clerical tribunals came to rival, if not to excel in importance, those of the state. The canons of the Greek Church, a portion of which were said to be the work of the apostles, added to and explained by general councils, were sanctioned by the Novels of Justinian, and have so been viewed as a portion of the body of civil law. A collection of canons was made in the year 520; and this work, with the papal decrees, and the privileges conceded to the church by Charlemagne, formed the chief subject-matter of the canon law down to the twelfth century. It was then that this law ceased to be the mere regulations of a peculiar body, and became a general system of jurisprudence. About the year 1114, a collection of the decrees of popes and cardinals was commenced by Ivo, Bishop of Chartres, and was revised and completed in 1149 by Gratian, a Benedictine monk. Another element in the system consisted of the Decretals, which were reprints or epistles by the pope, or by the pope and cardinals, deciding how the law of the church stood concerning disputed matters referred to them. These were first collected and edited in 1234 by Rainond de Renafort, chaplain to Gregory IX. This work was divided into five books, to which a sixth was added under the auspices of Boniface VIII. in 1298. These two great works, with some additions made to them by succeeding popes, formed what, in imitation of the collected works in the law of Rome, was called the *Corpus Juris Canonici*, or Body of the Canon Law. Besides these general statutes, there were local canon laws passed by the clergy of various countries, at national or provincial assemblies, held under the auspices of papal legates or archbishops. In the reign of Henry III. there were assemblies of the former kind; and under the respective archbishops of England there were frequent provincial synods. In Scotland, two provincial synods, held at

Perth in 1242 and 1269, passed some important laws regarding tithes.

The great aim of ecclesiastical legislation was to bring civil questions within its pale. Disputes as to tithes and the privileges of the clergy came very naturally to its hand. The priesthood were in a great measure intrusted with the administration of legacies, especially where they were destined to pious uses; and they thus acquired a jurisdiction in questions of succession, of which we see vestiges in this country in the Court of Arches and the other ecclesiastical courts of England, and the commissary system in Scotland. Marriage being constituted a sacrament, the canon law not only took into its hands all questions regarding the union and separation of the parties, but adjudged in the criminal act out of which the latter circumstance might arise, and took under its cognisance questions as to dower. The church obtained a powerful hold over the proceedings of ordinary courts of law, by the introduction of the practice of witnesses and parties calling God to attest the truth of their statements—the origin of the present system of administering an oath. Over this ceremony, and all matters connected with the truth or falsehood of the statement it sanctioned, the clergy took a particular charge. Notaries, who, in the days of ignorance, were intrusted with the execution and registration of contracts—who, in fact, were the living registers of almost all transactions of importance, were necessarily taken from the only class who could write—the churchmen—and their appointment and removal naturally fell into ecclesiastical hands.

A great rivalry thus existed between the civil and the canon law; but it was a friendly rivalry. The clergy were the repositories of both systems, and they had to decide how much should be assigned to the one and how much to the other. The canon law borrowed largely from the civil, of which it is sometimes considered a mere branch; it was naturally, indeed, the object of the clergy not so much to change the law itself, as to take the administration of it into their own hands. To be *juris utriusque doctor*, or doctor of either law, civil and canon, was a common distinction. During Henry VIII.'s reign, lectures on the canon law were abolished in England, and with them the corresponding degree. Jealous as the English were of the encroachments of the civil law, they still more determinedly opposed that of the canon. What the powerful court of Rome had set its heart upon, however, could not be wholly resisted; but it was always a principle, that though the civil authorities of England might take laws from the ecclesiastical system, the canon law was never, in its own simple authority, to be obeyed within the realm.

### THE FEUDAL LAW.

The feudal system and the Roman law may be said to have struggled for supremacy through nearly the whole of modern Europe. Of the influence of the latter we have already taken a cursory view. The former was an ingredient in the constitution of the continental and British monarchies. It was the source of those popular or aristocratic assemblies which shared more or less, according to circumstances, the government of the various states in which they existed; and it was thus the ostensible origin of the British parliament. The constitution of the German empire is essentially feudal; and the customs, or peculiar local laws of the various provinces of France, previously to the Revolution, were models from which the system was studied. The English law, especially that of real or landed property, is full of feudal usages, though their operation has often been checked. In Scotland, the forms of the feudal system may be found existing in almost original purity, though, as we shall hereafter see, they have been adapted, perhaps as far as they are capable of being so, to the wants of civilised times.

An account of the rise and progress of the Roman law must, for obvious reasons, be far more satisfactory than any that can be given of the feudal system. The

former was (at least the greater part of it) the construction of ingenious individuals, possessed of authority to enforce their mandates on their fellow-beings. The latter gradually rose out of circumstances and the state of society. It was not devised by a powerful legislator, to be promulgated to a willing people; but it rose out of habits and events which took place in an age when there were no historians to record their progress. Hence the origin of the feudal system has been a fruitful subject of debate and theory; and in the absence of facts, it has often been necessary to resort to moral deductions. It has been maintained by some that nothing can be more simple than the feudal system; that it was a mere arrangement by which military service was given in exchange for land, and that many half-civilised nations present instances of a similar contract. Ingenious speculators have found the resemblance of the system in particular stages of the history of Greece and Rome, in Turkey, Persia, Hindoostan, and the Highlands of Scotland, among the aborigines of North America, and in the Loo-choo Islands. But however important may be the investigation of such analogies between the practice of mankind under different circumstances, as a part of the history of the human mind, they throw but little light on the feudal system, the chief interest of which is to be found in the vastness of the field which it covered, and the influence which it has exercised for so many centuries over the legal institutions of Europe.

The essential elements of the feudal system were land, and military service given for the use of it, by the vassal who held it, to the superior of whom it was held. It would be wrong to speak of either of these two parties as the absolute proprietor of the lands; for in the more perfect stage of the system, each had his own peculiar privileges, with which the other had no right to interfere, except where the law permitted him. The vassal was not, in the general case, the slave of the superior. The duties and services he had to perform were regulated by compact or custom. On the other hand, however, he was not the independent proprietor of the lands he held. He could not convey them to a purchaser, nor could he pledge or bequeath them, without obtaining the sanction of the superior to the person to be substituted to him. Land was thus completely removed from the operation of commerce; and in those countries where the feudal system continued to exist, it was only by fictions and connivances—by bribing the superior, or getting the courts of law to compel him to give his consent—that sales and pledges could be effected. The lands held in this manner were termed *fiefs*. When they became hereditary, as they did apparently by custom, arising from the tacit consent of the parties interested, the superior was still presumed to give an assent to the change from father to son; and before he acknowledged the latter as his vassal, he exacted from him a fine. When the successor was a minor, and thence unable to fulfil the military duties of the fief, the superior in some cases became his guardian, drawing the rents of the estate, and compelling him to marry whom he should point out, under a penalty which, it would seem, ought to amount to the sum which the guardian, or superior, could receive by selling the alliance. The superior's claim upon the estate during the vassal's minority became, like most other feudal exactions, fixed by usage, and seems in general to have amounted to one year's rent of the land. In some countries females could not succeed. In others, where their right was acknowledged, the superior claimed the privilege of assigning husbands to them; and exacted a fine, sometimes for admitting the husband as a new vassal, sometimes as the price for permitting him to marry his ward. The feudal system, like every other, had its degrees of goodness and badness. Where we find the milder features of the feudal law, the right of the lord over his female vassals, or the wives and children of his followers, was a mere tax; but where the darker influences of the system were at work, it gave legality to a licentious

despotism, which is frequently adduced as a disgusting memorial of the barbarism of feudalism. Of illustrations of despotism, indeed, the feudal system is full. Independently of its own peculiarities, it would have been impossible for any legal system to have passed through the scenes of rapine, blood, and barbarism which characterized the middle ages of Europe, without being the instrument of many iniquities. At the outbreak of the French Revolution, which at first was little more than an attack on the most offensive relics of feudalism in France, some of these horrors were dragged from their dingy retreat in parchment records and black-letter chronicles, to add to the frenzy of the times. Among other instances, was adduced that of a feudal lord, on his return from the chase in winter, disembowelling a vassal, that he might keep his feet warm in the reeking trunk during the evening revel.

The proper return of the vassal for his lands and the protection of his lord was, as already stated, military service. Where this system was established as a fixed law, the quantity of service to be so given was regulated. A knight's fee imposed on the holder the duty of being forty days in the field for his superior, and the half or quarter of a knight's fee involved corresponding proportions of service. When fiefs came first into existence, it is probable that there was no other service worth possessing but the use of the strong arm. Conquered land was what the chief possessed, men to fight more battles was what he wanted; so that the one became the price of the other. It was not always the case, however, that land was valuable for nothing but as the reward of fighting, and it was gradually bestowed for other considerations; yet so closely connected had the relation of a military tenure become with land, that any other method of disposal was considered as irregular, and merely exceptional. Hence, when land was given without a price, and for the understood return of military service, it was said to be a proper feu; when any other consideration, such as a sum of money, was stipulated for, it was said to be improper. The former was always presumed to be the condition on which land was given, the latter required to be specially proved, and the unwillingness to admit it called for those legal subtleties which have made the commerce inland to this day so complicated. It behoved that there should be possessors of land who were not of necessity soldiers, and it was necessary to the monarch, or feudal superior, to employ people in various other capacities. All, however, took the impression and stamp, as it were, of fiefs. Salaries, taxes, honours, and dignities, even board and lodging, were feued out: the person who had engaged to bestow them acted the part of superior, and he who received them that of vassal. The church enjoyed lands which were not exempt from the ordinary feudal services. In the earlier ages, churchmen in many cases themselves assumed the spear and buckler. When it was considered inconsistent for churchmen to fight, it was held as by no means unsuitable for the church to employ soldiers. A clerical establishment would sometimes appoint a patron, or chivalrous assistant, in the person of a neighbouring baron, who would be called the 'advocate' of the establishment—the use, by the way, to which that word, which now designates a class of peaceful lawyers, was first applied. It is not unfrequent to find in old tenures that a particular monastery is to supply so many archers and spearmen for so many days.

Borough communities were another class to whom military service seems inapplicable, but who nevertheless almost universally held by that tenure. They obtained certain privileges, and in return they had generally to keep watch and ward in their respective towns; a service in which their own safety might not be less interested than the ambition of their lord. As the privileges conceded to these communities were large and important, they did not, in general, escape taxation along with their military duties; and in later times, these exactions became generally commuted for a money payment. The privileges usually conceded to these

commercial communities consisted of an exemption from the more vexatious of the feudal exactions, to be shortly noticed. These were generally conceded to them by the monarchs, as a counterpoise to the growing power of the feudal aristocracy; and within these sanctuaries commerce and civilisation created a power, by which both kings and nobility were effectually held in check.

Among those who were placed in the position of feudal vassals to the seignior, or lord, were his own domestic servants, whose power and influence would be, to a certain extent, measured by that of their master. To perform the menial duties of his household, a Roman emperor employed a slave, just as a senator or a pro-consul might do. The barbarian conquerors, however, gave lands to those who performed these functions; and the person who performed for Charlemagne the office of butler, valet, huntsman, or groom, got for his services the commodity most readily at his master's hands—portions of conquered territory. The services were thus performed as the consideration for feudal benefices. The menial servant of the monarch might have tenants and retainers under him; and thus the wages ennobled the functions. Hence we have had in modern Europe masters of the robes, grooms of the stole, masters of the buckhounds, masters of the horse, &c. held by the highest nobility of the realm. The *graf*, or land-steward of a district, was an important personage. Instead of attending to the letting of paddocks, and the rotation of crops, he was intrusted with the power of life and death over the inhabitants. The humble grieve, who has the management of a small landed estate in Scotland, and the shire-reeve, or sheriff, who performs high judicial functions in the same part of the empire, have divided, as it were, between them the original duties of the feudal officer from whom their names are derived. The same feudal origin may be as distinctly traced, on a larger scale, in the relation of master and servant in modern times. Servitude, however menial, when allied with feudal dependence, did not carry the same degradation as mere slavery; and in the opinion of some, the situation of the feudal attendant was higher than that of the menial servant of modern days, who freely gives his labour and attendance for a price. In Scotland, where feudal usages have lingered so long, it has been remarked that the relation between master and servant is of a more confidential nature than it is found to be in other parts of the country. While the line drawn between their positions is as clear as it can well be in a free country, the situation of the servant has a more than ordinary share of respectability attached to it, because, instead of being the individual servant of an individual master, he and his race are looked upon, to a certain extent, as the retainers of the house which he serves. On this point, indeed, an adherence to feudal usages in situations to which they are not applicable, has been productive of one of the greatest evils of modern society—the extent to which servants are kept, not for use, but as an ornamental evidence of wealth. Our lineal aristocracy continue to follow, so far as the usages of the day permit, the practice of their ancestors; and the gentlemen of plush and shoulder-knots are the representatives of those who wore buff jerkins, and handled the pike. The rich merchant and manufacturer must not be without the usual insignia of wealth; and thus a race, whom idleness and constant association with each other must deprave, are kept up among a bustling and active community, as if we lived in the days when the majority must either serve or starve. It has been remarked, that in republics such as Holland was, the wealth of rich individuals generally took the more ennobling direction of patronising the fine arts and literature.

In the earlier ages of the feudal system, when there was much land to distribute, the natural features and boundaries were sometimes little known to those who gave it away. The persons who received it were aggrandising and ambitious, and not likely to yield to each other disputed portions. Above all, the conquerors were uneducated, and had little means of giving per-

petuity to their bounty by written deeds. From all these circumstances, the investiture of the vassal became a very important and solemn affair. Investiture was divided into proper and improper. By the former, the superior went in person to the land, assembled all his other vassals upon it, and showed them the portion he had assigned to his new follower. The vassal, upon this, did homage, accepting the grant, and promising to perform the usual services in return. By the improper investiture, of the full practice of which in our own day we shall give an instance, the superior gave authority to his bailiff, or some other person, to give investiture, which was done by the symbolical delivery of a portion of the property—some earth and a piece of stone generally—to the vassal, or some person authorised by him to accept the grant and perform his homage. Writing was probably in use before this latter usage was commenced, and the authority was generally a written one. The solemn investiture in presence of the co-vassals finally descended to a mummery between an attorney and his clerks. The necessity to have acts regarding the fiefs of a superior witnessed by his vassals, can be traced to a connection with two of the most important institutions of modern times. The great vassals of a king, met together in public assembly to discuss what aids they might afford for their fiefs, how they were to defend them, &c. merged into a great council or legislature; and it is to such a body that the British parliament at least partly owes its origin. At this moment, the bishops of England sit in the House of Lords in virtue of the feudal baronies which they hold of the crown. Vassals of the lower grade were often summoned to attend at the hall of their lord as assessors, or assizers, to give, partly opinion, partly evidence, concerning some matter connected with the fief, or the conduct or rights of a fellow-vassal. With this institution, the system of trial by jury is intimately connected. A jury of perambulation, for the purpose of ascertaining boundaries—a sort of body lineally descended from the assemblage of co-vassals who were present at the investiture, and witnessed the extent of the gift—has been known in modern times.

It is probable, that if the feudal system had only established a relation between the monarch and his immediate vassals, the influence it would have exercised over the state of Europe would have been comparatively slight. The distribution of land as the reward of services, is frequently exemplified in history; but that which chiefly distinguished the feudal system, is the numerous grades of dependence, and the manner in which all parts of society, from the emperor to the lowest serf, were bound together in one system of lord and vassal. In the first place, there were various grades of vassals holding of the monarch. The majority of the lower classes, however, generally found themselves under the protection of some intermediate chief. The duke, or count, who held immediately of the crown, sub-feued to a dependant, who, on his part, might dispose of a fragment in a similar manner. By such an alienation, however, the vassal dared not in anyway interfere with his superior's rights; the latter, indeed, was not presumed to be conscious of the sub-infeudation, unless he had specially sanctioned it, and by doing so, he acknowledged the sub-vassal as his own immediate retainer. When a vassal, therefore, sub-feued without his superior's consent, he gave only a portion of the estate he himself possessed, his sub-vassal being liable to meet all the exactions that might fall upon him. So, if he rebelled against his lord, or withheld the feudal exactions, the superior could seize upon the fief without reference to the claims of the sub-vassal. The highest feudal noble was the Heretoch, who, from the Latin *dux*, a leader, received the designation of duke: this class was intrusted with the administration of large provinces. The *graf*, who had a smaller charge, was called *comes*, or count; and one class of *graf*, who was intrusted with the marches, was called the *mar-grave*, *march-graf*, or marquis. These nobles generally held lands of their sovereign, while

they were authorised to represent his person over the districts to which they were assigned, administering justice in his name, levying his feudal exactions on his vassals, and receiving their homage. These powerful feudatories were held in check by Charlemagne; but under his successors, and the other European monarchs, it became their aim to be the independent sovereigns of the territories committed to their charge—an object in which they were more or less successful according to circumstances, some throwing off their master's yoke, while others made themselves intermediate superiors between the king and his vassals. The various states of Italy and Germany are illustrations of the working of these events. The feudatories of France made a very near approach to independent sovereignties. They possessed within their own dominions the right of coining money, that of waging private war, exemption from all tributes, except the limited feudal duties by which they acknowledged the superiority of the crown, and finally, freedom from legislative and judicial control on the part of the sovereign and his courts. The vassal, too, in looking after his own concerns, sometimes conquered territories not inferior to those of his lord; and under such circumstances there was little chance of his being an obedient retainer. The Duke of Normandy, the vassal of the king of France, became monarch of England, and the Dukes of Burgundy were little less powerful.

From these high personages, vassalage went through many gradations, till it reached abject slavery. There were the *vassalors* and *châtelains*, dependants on the higher nobility, but who themselves had large estates and fortified their houses. There were the burghers of free towns, whose privileges have been already mentioned. Of rank corresponding in the rural districts, were the *soilage-holders*, and the class so well known in England by the designation *yeomen*. The lowest grade were the *villains* or *serfs*, to whom was committed the task of tilling the lands which the soldier gained or protected. It was the characteristic of the other grades of feudality to impose duties upon the lord, corresponding to those of the vassal, but the villain had little power to exact performance of these regulations. There were grades, however, even among the serfs, though probably there were not instances in which one held of another as vassal and superior. The peculiarity of the class was, that they were astricted to the domain, and went with it when it changed hands. Some, however, had rights and privileges which they might maintain in the court of the manor of their lord. Some held small estates, which, however, they could not dispose of. The lowest class were as abject and unprivileged as the slaves or the Romans.

The different classes of feudal taxes have been mentioned above. There were others, however, of a more miscellaneous nature, which were chiefly encroachments on the purer spirit of feudality, dictated by despotism and cupidity. It was upon the vassals who approached nearest to the state of villeinage that these innovations naturally fell most heavily. They were designated 'aids,' and were demanded by the lord on any occasion which caused him outlay. If he had to make war with a neighbour, or to portion off a relation in marriage, or to ransom a son, he demanded an aid. Aids were profusely exacted by the knights who joined in the Crusades. In England, the aids that might be exacted, were restricted by *Magna Charta* to three: they were for the purpose of making the lord's eldest son a knight, for marrying his eldest daughter, and for redeeming his person from prison. By exactions in a different form, the more servile vassals were fleeced and kept in subjection. The superior, if he built a mill, astricted all his vassals to grind their grain at it, compelling them to pay a tax for the service they were forced to receive. He compelled them to assist in making roads and building bridges, and he exacted tolls of all below the degree of freeholders who crossed them—a system which placed impediments in the way of vassals escaping from place to place. He obtained tolls and duties, too, on

the export and import of commodities; and if he found a clever artisan on his premises, he would keep him and his services for his own use.

The revival of literature was not favourable to pure feudalism. It brought with it the study of the civil and canon laws, and it was through the lights so acquired that the feudal customs were interpreted. The decline of the spirit of the feudal law is matter of history, and a view of it would lead to too long a digression. Not only its effects upon society, but its literal forms, still linger amongst us; even in republican America there is pride and boast of birth, and a knowledge of the feudal system is sometimes requisite in ascertaining the title to property.

#### THE LAW OF ENGLAND.

England has already been mentioned as an exception to the general prevalence in Europe of the civil and canon laws; not that these systems were totally repulsed, but that they met with a countervailing resistance, which prevented them from obtaining the influence they possessed in other countries. This resistance may be found in the existence of a different, and, it may perhaps be said, hostile system, called the common law, and to the power of parliament to make laws or statutes. The three great elements of the jurisprudence of England are the common law, the law of equity, and the statute law. To these may be added, as codes limited to particular spheres, the Admiralty law and the ecclesiastical law.

#### Common Law.

Speaking of the common law, Sir Matthew Hale, its historian, says: 'This is that law by which proceedings and determinations in the king's ordinary courts of justice are directed and guided. This directs the course of descents of lands, and the kinds, the natures, and the extents and qualifications of estates; therein, also, the manner, forms, ceremonies, and solemnities of transferring estates from one to another; the rules of settling, acquiring, and transferring of properties; the forms, solemnities, and obligations of contracts; the rules and directions for the exposition of wills, deeds, and acts of parliament; the process, proceedings, judgments, and executions of the king's ordinary courts of justice; the limits, bounds, and extent of courts, and their jurisdictions; the several kind of temporal offences and punishments at common law, and the manner of the application of the several kinds of punishments; and infinite more particulars, which extend themselves as large as the many exigencies in the distribution of the king's ordinary justice require.'

The origin of this system—one of the most interesting subjects of modern investigation—is involved in deep obscurity. Its progress subsequently to the reign of Edward I., who has been called the English Justinian, is pretty accurately noticed; but when an unprofessional inquirer reads those portions of English law-books which attempt to carry the history to an earlier period, he cannot help feeling disappointed at the unsatisfactory result. The more marked features of the system were, doubtless, the customs of the Anglo-Saxons. A collection of the laws of England during the heptarchy, or laws of the Anglo-Saxons, was published by an eminent antiquary at the commencement of the eighteenth century; but there is great reason to believe that they were written some centuries after the Conquest; while the fragments of Anglo-Saxon legislation which they contain refer chiefly to the arrangement of the military force, the clergy, and other matters of general or police regulation, which, in the present instance, are less interesting than a little insight into the laws relating to private rights would be. Alfred and Edgar have acquired much fame for having collected and arranged the laws of their predecessors, reformed them where they were impolitic, and completed them where deficient; but it would be difficult to determine their exact merits. Edward the Confessor enjoys a similar reputation. To

him, indeed, history supplies us with good ground for referring equitable laws, for we find that when the people complained against the oppression of the Norman kings, they demanded 'the good old laws of Edward the Confessor.' It is probable, however, that the compliment did not apply to him so much in the capacity of a legislator as that of the last of the Saxon kings.

Whatever may have been the exact nature of the laws of the Anglo-Saxons, the Conquest effectually incorporated them with the feudal system, and the connection between vassal and superior became one of the most important features of the common law. It is not to be supposed, however, that this was the earliest visit of feudal institutions to Britain. The Saxons could not well escape the influence of a system which had deeply rooted itself among the kindred nations of the continent; and many feudal institutions are to be found existing under the Saxon kings. The increase of the spirit of feudalism under the sway of William the Conqueror was, however, so great, that many authors have attributed its origin in England to the era of the Conquest. It was then, indeed, that it became oppressive. The conqueror brought with him the system of his own province, for which he was a vassal to the king of France, and could not admit the possession of landed property in England, except as held from himself in the capacity of lord paramount. The greater nobles—chiefly the Conqueror's companions in arms—naturally held the lands he liberally bestowed on them of him as superior, and they compelled all who lived upon their lands, or even in their neighbourhood, to acknowledge them as liege lords. The forcible increase of such a system as the feudal law could not but be attended with acts of great oppression. These were added to by the selfish magnificence of the princes, who cleared large tracts of country of inhabitants, that they might enjoy the regal pleasures of the chase in undisturbed tranquillity. The Saxons had their own county courts, but the greater part of the causes were, after the Conquest, removed from them to be pleaded in the court of the monarch, which attended on his own person. Legal proceedings were conducted in the Norman dialect of the French, which was afterwards changed into Latin. The use of a tongue unknown to the people at large continued down to the days of Oliver Cromwell, and at the Restoration was restored, with some other absurd practices. It was abolished in as far as respects the proceedings of the courts in 1730.

The charters that were so often granted by the earlier kings to the impotency of their subjects, were partially restrictions of the tyranny of the feudal law, and partially promises to adhere to the old Saxon customs—promises which would not have been so often exacted if they had not been continually broken. The most celebrated of these is that conceded by King John, called Magna Charta, or the Great Charter. Its privileges are in a great measure constitutional, and it has often been said that it was procured for the advantage of the aristocracy, and not of the people; but it is not without stipulations in favour of the latter, protecting them both from the crown and from the nobility. It restricts the tyrannical forest laws, and the arbitrary exactions by feudal lords from their vassals. The clause which has attracted chief interest, however, is that which says that no freeman shall be affected in his person or property, save by the legal judgment of his peers, or by the law of the land. Legal writers have found a stately tree of liberty growing out of the seed planted by this simple sentence. They discover in it the origin of that judicial strictness which has kept the English judges so close to the rules laid down for them in the books and decisions of their predecessors. The judgment by peers is said to refer to jury trial, and it is urged that the whole clause strikes against arbitrary imprisonments, and involves the principle of the *habeas corpus*, by which every man, whose liberty is restricted, may demand to be brought before some competent court, in order that he may be either convicted or liberated. The Great Charter has always been a

favourite object of veneration both with the aristocracy and the people, and Sir Edward Coke reckons no less than thirty different occasions on which it was ratified.

Civil liberty may be defined as the permission of such an amount of free action as it is most conducive to the welfare of all that each individual should possess. This is one of the most important objects of the laws, and the circumstances which conduce to its existence are among the most interesting in legal history. In England, the progress of liberty has been in a great measure attributed to the division of interests in the country. The crown had an interest in checking the power of the great nobility. That the exercise of this power was essential to the liberty that has existed in England, is apparent in contemplating the state of France and Germany, where the aristocracy made themselves either quite or nearly independent of the crown, and revelled in the tyranny of their despotic wills unchecked. A very important blow to the power of the aristocracy was accomplished by Edward I. in 1290, by the abolition of the system of sub-feuing. From that day, no vassal of the crown could grant lands to be held of himself, as he may to this day in Scotland—he could only put a new vassal in his own place, as an adherent of the crown. There is evidence that a similar law was passed in Scotland, but the crown was not strong enough to enforce an enactment which deprived the aristocracy of the privilege of being petty sovereigns. The disputes with the church were not without their service. The attempts of the ecclesiastics to urge the claims of their Roman and canon laws, caused the common lawyers to isolate themselves from the slavish doctrines of these systems, and to resist their encroachment with true professional hatred. It was in the universities of course that the clergy had their chief influence; and the students of the common law formed themselves into rival institutions, from which originated the Inns of Court. Then there was in the boroughs a separate interest, powerfully pointing towards freedom, and possessed of an influence not to be despised. The tendency of all these circumstances seems to have been, a gradual return to Saxon freedom, and a fixing of the common law in conformity with the long-cherished feelings of the English people.

That strong-minded and clear-headed man Edward I., whose ambition was so heavy a curse to his neighbours, took a great stride in the establishment of the common law. Of his reforms, as enumerated by Blackstone, we give the following specimens:— He established, confirmed, and settled the Great Charter and Charter of Forests. He gave a mortal wound to the encroachments of the pope and his clergy, by limiting and establishing the grounds of ecclesiastical jurisdiction; and by obliging the ordinary, to whom all the goods of intestates at that time belonged, to discharge the debts of the deceased. He defined the limits of the several temporal courts of the highest jurisdiction—those of the King's Bench, Common Pleas, and Exchequer—so as they might not interfere with each other's proper business; to do which they must now have recourse to a fiction, very necessary and beneficial in the present enlarged state of property. He settled the boundaries of the inferior courts in counties, hundreds, and manors, confining them to causes of no great amount, according to their primitive institution, though of considerably greater than by the alteration of the value of money they are now permitted to determine. He secured the property of the subject by abolishing all arbitrary taxes, and talliages levied without consent of the national council. He guarded the common justice of the kingdom from abuses, by giving up the royal prerogative of sending mandates to interfere in private causes. He instituted a speedier way for the recovery of debts, by granting execution, not only upon goods and chattels, but also upon lands, by writ of *elegit*, which was of signal benefit to a trading people; and upon the same commercial ideas, he also allowed the charging of lands in a statute merchant, to pay debts contracted in trade, contrary to all feudal principles.' This last-mentioned

reform refers to measures for enabling a creditor to get possession of his debtor's land in payment of his debt. How opposed such a remedy would be to feudal principles may easily be conceived; and the boldness with which Edward made his reforms will be felt when it is considered that what he had thus commenced was only completed in 1833. If the debt of a landed proprietor were not substantiated by some bond or other document, his land could not be applied in payment of it on his decease; and it was only in that year that landed property was made fully available for 'simple contract debts.' The statement that Edward imposed limits on ecclesiastical jurisdictions, refers to the authority which the clergy arrogated regarding wills—already mentioned under the head of the canon law. Edward allowed them the charge of the deceased's effects, but compelled them to employ the money in paying his debts.

From the period when we discover any branch of the common law in existence, we find its observance rigorously enforced by the judges. Of course, they had very frequently, as society progressed, to apply it to the wants of an age very different from that in which it was invented; but, in doing so, instead of directly altering the law, which they always viewed as beyond their power, they accomplished the change by a manoeuvre almost peculiar to the law of England, called 'a fiction.' A fiction may be defined to be the taking for granted that a thing has been done which has not been done, and acting accordingly. For instance, if a man had taken an article in loan or on hire, and refused to give it up to the owner, the legal remedy, by the common law, was a very complicated one. In the case, however, where a man had found another's property which he refused to restore, there was a very expeditious and distinct remedy. It occurred to lawyers, that the kind of process used in this latter case was the very thing that would be most suitable for the other; and therefore, when they brought an action against a person who thus wrongfully detained the goods of another, they stated that he had found them, and the judges, agreeing in the propriety of the form of action being applied to the purpose, would not allow the party to show that there was no finding in the case. Hence the well-known action of trover, from the French *trouver*, to find. Some curious illustrations of fictions of law will be given when we describe the method in which the courts acquired their jurisdiction.

Fictions were not, however, the only means by which the judges, while adhering apparently to the letter of the law, could adjust it to their own views of the wants of society. A far-seeing judge who looked forward to the probable rise of a new system of transactions, could, by a swaying of the principles of the law that might be quite imperceptible at the moment, adapt them to the new exigencies. It was thus that Lord Mansfield, without the aid of statute, created the law of insurance. There are frequently many underwriters, or insurers to a policy; and had the practice been as it was, each would have had to be prosecuted separately on the occasion of a loss; but Mansfield, by a very slight divergence from previous practice, brought all the claims in a policy into one action—an expedient without which the system as it at present stands could not have existed. This was accomplished by a rule of court known by the name of the Consolidation Rule, by which all the actions except one is stayed, on the various defendants becoming bound to abide by the issue of that action. In their covert efforts to change the laws, the judges did not spare even acts of parliament. They managed to hit a blow at the power of the aristocracy, by limiting the operation of the statute of entails. When the holder of the entailed estate wished to sell it, he let the buyer bring an action against him, alleging that he had no title. He said he had bought the property from some one—usually the crier of the court—whose duty it was to support his title. The crier being called in, made default, and was nominally adjudged to give the holder under the entail an equi-

valent, with whom there was no effectual competitor, while the estate was adjudged to the purchaser.

The repositories of the common law are the treatises of eminent lawyers and the reports of decisions. Of the former, there are several of the thirteenth and fourteenth centuries—Glanvil, Bracton, Hengham, and the book called *Fleta*, the authorship of which is unknown. Lyttleton's treatise on Tenures, the work of a more matured system, was long the text-book in the practice of the feudal law. It was in the humble form of a comment on this work, that the great Chief-Justice Coke issued the vast treasury of legal learning so familiarly known as 'Coke upon Lyttleton,' a book which is in itself an almost inexhaustible subject of study to the lawyer. The next great name is Blackstone, a man who brought elegant accomplishments to bear on the austere drudgery of the law, and wrote a book, the clear perspicuity of which has made many men acquainted with the laws of their country who would have otherwise remained profoundly ignorant of them. The book has one great defect, that, professing to be not merely an exposition of the laws but an estimate of their worth, it bestows indiscriminate eulogy on all the vices of the system as well as its advantages. The reverential eye with which English lawyers look upon whatever is ancient in the common law, is singularly apparent in the majority of law-books. If any great authority, such as Coke or Blackstone, has treated of a particular subject, whoever afterwards writes upon it seems to be held bound to incorporate all that he has said, not only in spirit, but in words. As the passages are not marked as quoted, the effect is a very peculiar one; for the reader, after perusing a few sentences in the easy flow of the nineteenth century, finds himself unexpectedly entangled in the quaint language of the reign of James I., without the slightest hint that he is going to get, not the statement of the author himself, but something taken from Coke or Spelman. Of the reports of cases there is now a vast collection. From the time of Edward I. to that of Henry VIII., they were annually collected by officers appointed for the purpose, and were called year-books. They have latterly been published by private reporters. As they are all precedents for guidance in succeeding cases, and therefore the source to which the public look for the interpretation of the laws they must obey, it may be questioned whether they should not be officially recorded by persons responsible for the accuracy of their reports. This plan has to a certain extent been adopted in America.

#### Law of Equity.

The peculiar strictness with which the common law was administered, gave rise to the other great division of English jurisprudence—the law of equity. This was originally a system by which relief was given in cases where a strict interpretation of the common law would have produced injustice. It could look to the influence of accidents and frauds when common law could not. A deed, for instance, was lost. The common law courts could hear nothing about what might have been its contents. They could see nothing, know nothing, act on nothing, but the express words of the deed as set before them; and as that could not be found, the party must suffer. Here the court of equity came to his relief, by compelling a 'discovery' of the contents of the document. When a trustee was put in possession, common law could not look at him in any other light but as holding for his own behoof; but equity compelled him to do his duty to his employers. Where an obligation was to pay, common law could comprehend its nature and exact performance, but if it was to perform any other act, the assistance of equity was generally necessary. Again, the courts of law might give a remedy for a mischief after it had been perpetrated, but they could not interfere to prevent it. This necessary branch of legal administration came likewise within the jurisdiction of the judge in equity, who, on cause shown, could issue his 'injunction.'

The origin of this system is as obscure as that of the

common law, though it is evidently of a more modern date, having been introduced as a remedy to the evils of the latter. The earlier law-books do not mention it, and it was probably long in operation as a sort of exception to the ordinary course of law, before lawyers would acknowledge it as a system. Its most plausible origin is simply this—that when a person suffered a manifest injury which the ordinary courts could not remedy, he applied for redress to the sovereign in person. The king's conscience-keeper, or chaplain, became the referee on these occasions, and what he did he sealed, by way of testimony of the royal authority, with the king's seal. Hence the origin of the lord chancellor with his great seal, whose office, in this form, has been traced, or imagined to be traced, so far back as the days of Edward the Confessor. In early times, the chancellors were ecclesiastics, and they thus were in the habit of adjusting their equity, and the form in which they administered, it to the civil law. This occasioned great feuds with the common law courts, which at the commencement of the seventeenth century raged so fierce, that in a case where a remedy was sought in equity from the proceedings of the Court of King's Bench, the lawyers who conducted the proceeding, and a master in Chancery, were indicted for an offence. With the assistance of King James, whose legal notions were derived from the civilians, the courts of equity triumphed. The great Sir Edward Coke was then at the head of the King's Bench—a man who, notwithstanding his harsh and tyrannical acts, must still be admired for the bravery with which he supported the strict administration of the law, however high might be the personage who wished to evade it. Whatever may have been the origin of equity, it became at last a fixed system of law. It is a popular mistake that a judge in equity gives his decision according to what is called 'the general principles of equity and justice,' without reference to strict rules. He is bound down by precedents and rules, and there are many acts of parliament which regulate his proceedings; so that in reality equity is but a department of the general system of law.

Statute Law.

We have now to speak of the third branch of the law—statutes, or acts of parliament. The constitution of the legislature by which they are passed does not belong to the present subject; it need only be observed, that to be law, every word of an act requires to have the consent of the three branches of the legislature—the sovereign, the lords, and the commons. In very early times, acts of parliament seem to have been petitions by the parliament acceded to by the sovereign. The parliament was convened to supply the king with money, and while it kept him in suspense, it sometimes prepared a petition against grievances, to which a needy monarch found it prudent to accede. It became a practice for the judges, at the end of a session of parliament, to convert the substance of the 'petitions,' or 'bills,' which had been acceded to by the king, into acts. This practice was fraught with manifest danger, the judges having the power, when parliament had ceased to sit, of altering the intended provisions. To remedy this, the plan now followed was adopted, of making the bill contain the exact words which it was intended should constitute the act. Singularly enough, the bill is still in the form of a petition, and when it is made an act, the only alteration which takes place is, that the words 'May it therefore please your Majesty' are struck out.

A bill may be introduced either in the House of Commons or in the House of Lords. It is a rule that all bills affecting personal station—such as bills of attainder for treason, bills for naturalising foreigners, &c.—shall make their first appearance in the House of Lords. The commons possess the more substantial privilege of originating all bills of supply, or for the levying and appropriation of taxes. The privilege is jealously guarded, and it is usual, should

the House of Lords amend such a measure, for the House of Commons to refuse to take it into consideration again, and to authorise their speaker to throw it over the table. About seventy years ago, in the case of a bill for the protection of game, the House of Lords thought fit to raise the penalties higher than those sanctioned by the lower house, and as the money went to the exchequer, the commons considered this an infringement of their privileges, and acted accordingly. All measures involving taxation originate in what is called 'a committee of supply,' in which the house is presumed to be sitting, not to debate great questions, but simply to transact pecuniary business. In the case of the introduction of any ordinary bill, amending the law, into the House of Commons, the first stage is, to obtain leave from the house to 'bring it in.' In the House of Lords, a member may move a bill without previously obtaining leave. On a bill being brought in, the next step is the first reading. A member moves that it be read a first time. If there be a party in the house bitterly opposed to the principle of the measure, it may be opposed in this stage, and a debate and division will of course ensue. If the objections be merely to the details, they are reserved for a future opportunity. On its passing this ordeal, the bill is ordered to be printed.

The next and principal ordeal is the second reading, after which the bill is referred to a committee of the whole house to be examined. In this committee, as in a committee of supply, the body is the same in every respect as that which constitutes the House of Commons, but the members are considered as having assembled, not to debate general questions, but to enter on a business-like examination of the various clauses of the measure. When the committee have examined all the clauses, the next formality is, that they report to the house, and that their report be received. It is then moved that the bill be read a third time. This stage is, in disputed measures, generally the last trial of party strength. If the third reading is carried, there is still another motion, to the effect 'that the bill do pass,' and this motion is seldom opposed. On the bill passing one house, it is conveyed to the other, where it has to pass through the same succession of readings. When amendments are made on a bill after it has passed through one of the houses, in that to which it is then sent, it must be re-transmitted to the house where it first passed. That house may accede to the amendments, and so let the bill pass; or it may reject the whole measure in consequence of them; or it may, adhering to its first opinions, hold a conference with the other house, with a view to a settlement of differences. When a bill has passed both houses, its next step is the royal assent, which may be given either by the sovereign personally, or by commission.

A bill that has received the royal assent becomes a law, the operation of which commences from the moment when the consent is adhibited, unless another point of time be stated in the act. All the statutes of a session are ranked in order, according to the date at which they have received the royal assent; and the whole set are distinguished from others by the year of the reign in which they have been passed. Technically, the whole legislation of a session is called one act, and each statute or act, according to the common acceptation of the term, is called a chapter of it. The privilege of printing the statutes in their original state, without note or comment, is reserved to the king's or queen's printers. In the printed edition of the statutes, each chapter is divided into sections. This arrangement has been adopted by the printers for convenience of reference, but in the original copy of the act there is no such division—the whole is a continuous manuscript without break. Nor is the division into chapters even authoritative. The consequence is, that when a new act is passed, making alteration on some part of a previous one, instead of specifying the chapter and section that is altered, it describes the act vaguely, as an act passed in such a session, for such a purpose.

Thus, in 1839, an act was passed to alter a section of the Patents Act, passed in 1837. For any ordinary purpose, this would have been called an act to amend the seventh section of the act 5 and 6 William IV. chapter 83; this would have led to the exact point at once: but as there are no such things as chapters and sections known in law, the legislature could only give a roundabout description, thus—'An act to amend an act of the fifth and sixth years of the reign of his late Majesty William IV., intitled an act to amend the law touching letters-patent for inventions.' Sometimes there is a series of acts, the latter ones amending those that have preceded them, so that the titles are involved in almost inextricable confusion. Even where the acts are divided into sections, as they are by the printers, it is found very difficult for lawyers to unravel their meaning, and to unprofessional people they are often a sealed book. A section generally consists of but one sentence; and as it has often to give a long narrative of things that must be done, independently of circumstances, and others that must be done in particular cases, and others that may be done, but are not imperative, and others that must not be done, &c., the comprehension of the full meaning of the sentence requires a strong mental effort. Among the statutes, there are individual sentences which, if printed in the type and form of an ordinary three-volume novel, would fill a hundred pages.

There are some acts which are passed every session in the same terms, such as the Mutiny Act, the indemnity for neglecting to take the oaths, &c. Independently of these, the statutes now passed in a single year generally fill a quarto volume of about 500 pages, very closely printed. Besides these acts, which generally either apply to the whole empire, or to some one of the great national divisions of it, there are annually passed several folio volumes of statutes, called 'Public Local Acts,' consisting of the police acts of the various towns, and acts for the construction and management of harbours, turnpike roads, bridges, gas-works, water-works, railways, &c. It is by virtue of legislative authority only that monopolies can be constituted in such cases, and that individuals can be compelled to sell their property for the use of public works. Hence, this is a separate branch of the statute law, comprising several hundred volumes.

The necessity of consolidating together the various statutes on different subjects, has from time to time been felt and expressed by the first legal statesmen of Britain. Lord Bacon, in whose days the statute law did not occupy a twentieth part of its present bulk, spoke with alarm of its overgrown size, and recommended that the whole ought to be abridged before it should become unmanageable. Already something has been done. The revenue acts, which occupy a large portion of the statute-book, were partially consolidated in 1826. About 400 acts relating to the customs, and similar matters, the prevention of smuggling, registration of vessels, &c., were repealed, and the new regulations on the various heads were consolidated in eight acts. To these acts each subsequent session has generally made some addition; but to prevent confusion from this source, a very simple remedy has been devised. When there have been several additions made to an act, a new one is framed, embodying the whole contents of the old act, as altered by the subsequent ones, and then all previous legislation on the subject is repealed. Thus, in 1833, all the custom-house acts were a second time consolidated; that is to say, the acts of 1826, with the additions and alterations made to them by later acts, were embodied together in a set of new acts, so that no one, in consulting the custom-house laws, can have to go farther back than 1833.

Measures, we believe, are in active preparation to extend this principle to other departments. At this moment there are upwards of 120 stamp-acts in operation, one of them as old as the reign of William III. The existence of these confused masses of legis-

lation effectually prevents people from being able to act up to the laws, however willing they may be, and their protection is frequently in other people being equally ignorant of the laws that are broken. Invidious investigations into antiquated laws are thus occasionally the means of subjecting individuals to great hardships, by bringing punishment upon them which no foresight could have averted. Hence the trade of what are called common informers, whose vindication of the law has too often the effect of merely heaping calamities on individuals, instead of producing a uniform observance of the laws. The pursuit is a very unpopular one; but when laws are in every respect just and good, it is difficult to see how the enforcement of them can be other than an advantage; and it would appear to an unprejudiced stranger to be a somewhat contradictory practice, first to make laws, and then teach society to hate and punish those who put them in force. As society advances in intelligence, the necessity for the reform of the whole system of law, and its simplification into one comprehensive code, will become more apparent, while the mode of administering the law in courts will also be seen to require revision. Everything at present indicates that we are approaching the point when these important steps must be taken.

#### English Law Courts.

We have now to notice the various courts of law in England. The House of Lords must be mentioned as a general court of appeal from the whole kingdom. There is only one set of superior judicatures from which a reference may not come before it in some form or other—the criminal courts of Scotland. The origin of parliament is connected with the great council of the feudal kings, which gave them advice both in legislative and judicial matters. When parliament was separated into two houses, the judicial business adhered in general to the upper, and, probably at the instigation of the bishops, the Lords adopted the power of administering oaths, which was not possessed by the Commons—a circumstance which more distinctly marked their judicial character. To bring causes which have passed through the hands of learned judges under the direct cognisance of a body consisting of clergymen, soldiers, and young men of fashion, would be too preposterous to be practically adopted; and though the appeal is nominally taken to the House of Lords, it is heard and decided on by one of the eminent lawyers, of whom there are always several in the house, and generally by the Lord Chancellor. Independently of their powers as judges of appeal, the Peers act as a criminal court in all cases where a peer of the realm is tried for a capital crime. They are formed into a temporary tribunal for the occasion, presided over by a judge called the Lord High Steward. This official is properly the judge, the peers acting as a jury, and giving their verdict on the question of guilt. The directly feudal origin of this rule of ancient practice will be at once recognised.

The principal courts of first resort are naturally divided into courts of common law and courts of equity. The former are three in number: the King's or Queen's Bench, the Common Pleas, and the Exchequer. Each has a chief, and four assistant judges, called puisne or junior judges. These courts date their origin to the Conquest. On feudal principles, the Norman kings called all the principal causes which had, under the Saxons, proceeded before the county courts, to be decided in their own hall, or court, by their own great council, which was presided over by an officer called the Justiciar. This court, called the *Aula Regis*, or King's Court, at first followed the king's person—a great inconvenience, removed by Magna Charta, which fixed it permanently in Westminster. Under Edward I., the system was adopted of sending deputations from the court twice a year to try cases in various parts of the country. Under the same monarch, the jurisdiction of the court was split into three parts. To the justiciar, afterwards called Chief-Justice, were assigned

the pleas of the crown, as they were termed, involving all offences; and being the highest judicial officer in point of rank, his court was appointed to have cognisance over the two others. The matters connected with the exchequers—namely, the regulation of the royal domains, the collection of duties and other taxes—were committed to judges called Barons, presided over by a Chief-Baron. All questions about the possession of land, and other litigations between one citizen and another regarding matters of property, were called ‘common pleas,’ and were committed to certain justices, presided over by a chief-justice.

The King’s or Queen’s Bench is thus the chief criminal court, and the Exchequer is the principal tribunal for revenue matters; but these courts are by no means restricted to the departments to which they are so assigned—they possess, concurrently with the common pleas, a jurisdiction in all ordinary questions of common law. The manner in which they obtained this power is one of the most extraordinary circumstances in the history of the laws of any country. The instruments made use of were, as has been hinted, the fictions, described as a peculiarity of the English law. To get at the real motives which were at work, it is necessary to recollect that formerly not only the judges, but all the officials connected with the several courts, were paid by fees, the amount of which depended on the extent of business transacted. They were thus like so many tradesmen keeping shops for the sale of justice, each anxious to keep a large supply of whatever was most wanted, and to serve the public on the most tempting terms. In this manner the courts of law undersold the courts of equity by not demanding any sanction, such as an oath, for the truth of what litigants declared in their pleadings. An arduous run for business was carried on between the three common law courts, the accounts of which, as given in the legal histories and law-books, are infinitely grotesque. The extent to which a court could carry its jurisdiction by these means, depended less upon reason than upon the muscular power of those officers of the court who enforced its decrees. The Exchequer, when it attempted to levy taxes, was told occasionally that the person charged with them could not pay, by reason that his debtors had not paid what they owed him; while he hinted that if the Exchequer wished his money, they had better assist him in recovering it. On this, it became the practice of the Exchequer to assist those who were in debt to the crown to get payment of the money due to them. It occurred to some ingenious lawyers, employed to recover debts, that if they stated to the Court of Exchequer that certain clients were debtors of the crown, and could not pay by reason of their own debtors not satisfying their demands, the court would make very little inquiry into the truth of the statement, but would adjudicate in the case, and levy the money forthwith. The court made so little inquiry as to the truth of the case, that it would not allow the statement to be contradicted, however inaccurate it might be; and down to the year 1832, when one brought an action in the Court of Exchequer, it was a matter of form that he should say he was a debtor to the king, and that he could not pay his debt, unless an obligation, incurred in his favour by the defendant, were fulfilled. The jurisdiction of the King’s Bench was limited to cases that were either purely criminal, or had some connection with offences. When any one, however, happened to be in the prison of the King’s Bench for an offence, there was no means of getting at him but through that court; and so the plan was devised of stating that a man was in the King’s Bench prison when he was not. ‘And in process of time,’ says Blackstone, ‘it [the Court of King’s Bench] began, by a fiction, to hold pleas of all personal actions whatsoever, and has continued to do so for ages: it being surmised that the defendant is arrested for a supposed trespass, which he never has, in reality, committed; and being thus in custody of the marshal of the court, the plaintiff is at liberty to proceed against him for any other personal injury, which surmise of

being in the marshal’s custody the defendant is not at liberty to dispute.’

These mischievous fictions were not abolished until the year 1832, when, by act of parliament, a uniform process was established in the three common law courts. An appeal lies from the decision of any one of these courts to the judges of the other two, who, when met to decide on such appeals, constitute a court called the Exchequer Chamber. Fourteen of the fifteen judges who form these common law courts hold the assizes in the various county towns—in some of them twice, and in others thrice a year. Here they act both as civil and criminal judges. Offences committed in London and its vicinity are tried by a tribunal lately created, called the Central Criminal Court.

The origin of the authority of equity tribunals has been already considered. The principal establishment of this description in England is that of the Chancery. It has in it three distinct courts, and three judges—the chancellor, the vice-chancellor, and the master of the rolls. Formerly, all proceedings in bankruptcy centered with the lord chancellor, but the increasing importance of this class of business rendered it necessary to appropriate a separate court to the purpose. This was accomplished in 1832 by Lord Brougham’s act. The term Bankruptcy is in England confined entirely to persons engaged in commerce; and the jurisdiction of the court is so limited. Previous to its formation, however, it had been found expedient to create a court for the relief of insolvent debtors who might not be engaged in trade, on their giving up their property to their creditors. By a late act for restricting imprisonment for debt, the practice of relieving insolvent debtors was improved, nearly on the model of the Scottish system of *cessio*, and a bankruptcy code was applied to debtors who might not be tradesmen. The utility and importance of the Insolvent Debtors’ Court were thus materially enlarged. Another court was lately brought into existence, called the Judicial Committee of the Privy Council. It consists almost entirely of the judges of the other courts. Its principal jurisdiction is in appeals from the colonial courts, and the Court of Admiralty. This Court of Admiralty has jurisdiction in maritime contracts, and crimes committed on the high seas. Having to deal with matters in which the inhabitants of this and of other countries are jointly interested, it professes to follow, not the special law of England, but the general commercial law of modern Europe, founded on the Roman law. In time of war, the court receives a commission to adjudicate regarding prizes taken from enemies, or from neutrals committing breaches of neutrality.

Besides the tribunals mentioned, there are ecclesiastical courts in the two archiepiscopal provinces of Canterbury and York. In the former there are the Court of Arches, the Prerogative or Testamentary Court, and the Court of Peculiars; in the latter the Prerogative Court and the Chancery Court. There are also many inferior ecclesiastical courts. The chief jurisdiction exercised by these tribunals, besides questions of ecclesiastical discipline, is in matters relating to succession to moveable goods. If we were to complete the list of English tribunals, it would be necessary to include the justices of peace, who, besides many special powers in revenue and other matters conferred by act of parliament, sit, at the general and quarter-sessions, as judges in minor offences. In addition to all these, there are various courts, of greater or lesser jurisdiction, connected with cities and boroughs; and in some places establishments called Courts of Requests, for adjudicating in cases of petty debts.

Having thus detailed the legal system of England, it is unnecessary to describe that of Ireland, which is almost in all respects a model of it.

#### English Legal Usages.

The legal usages of England, though sanctioned by inveterate custom, are generally clumsy, expensive, and to all but lawyers, unsatisfactory. The very

education of lawyers at the *inns of court* in London, where they are supposed to receive instruction, and pursue certain studies, is a burlesque. The whole machinery of executing writs, or orders of court, is equally objectionable. *Imprisonment* of the person for the sake of safe custody is the ordinary means of enforcing claims in the civil law, and of punishing in criminal cases. The largest jail for the reception of debtors is the Queen's Bench prison, situated in Southwark. From the marshal or governor of this prison, however, a *rule*, or permission, may be obtained on payment, for liberty to go out of the prison for a day, or to reside within certain exterior bounds. In other words, a debtor possessing the means (abstracted from his creditors) may, while nominally in prison, be living at his ease and in the enjoyment of the general society of the neighbourhood.

*Trial by Jury* is a remarkable legal usage, which, in reference to criminal accusation, is of great antiquity, having its foundation in certain Anglo-Saxon forms favourable to individual liberty. It is alluded to in Magna Charta, wherein it is provided that all persons accused of crimes shall be tried by the judgment of their peers according to the laws of the realm. A jury is therefore presumed to consist of persons in a rank as nearly as possible analogous to that of the party charged with an offence. Practically, it is composed of individuals miscellaneous in rank, so as to insure impartiality in decision. In England, the jury may be said to be of two species, the grand and the petty jury. The *grand jury* consists of twenty-four persons summoned by the sheriff, to attend the court and present all offences committed within the county; that is, determine whether the cases of criminal accusation shall go before the petty jury. The jury so called examine witnesses on oath, and receive other evidence; if satisfied that there are grounds for trial, they *find a true bill*, as it is called, and the trial proceeds. The object of this institution is to prevent the oppression or damage of innocent persons; but in practice it is so clumsy as a method of investigation and deliberation, and so liable to error from the vast quantity of business to be hurried through, not to speak of being so burdensome to the lieges, that it would long since have been abolished, but for the rooted prejudices of the English in favour of old usages, however absurd and valueless. The time seems to have arrived when it will require to be superseded by the more efficient institution of a responsible public prosecutor.

The petty jury for the trial of those against whom a true bill is found, consists of twelve men, drawn by lot from a larger number summoned. This jury is the sole judge of the fact or facts charged, and its decisions require to be unanimous. In many instances a jury cannot conscientiously arrive at an unanimous conviction, in which case either one or more must yield to the majority; or the whole, after experiencing the pangs of hunger for one or two days, require to be discharged, when a new trial must ensue.

Trial by jury is usually considered to be the paladium of our rights and liberties; but this favourable view of its character evidently needs modification. It is principally useful as a safeguard against vindictive attempts at oppression on the part of the crown or other powerful accusers; yet even in this respect it has on various occasions proved faulty. If, however, it really shelters the subject, it can scarcely be said to be capable in all circumstances of protecting the crown. In Ireland, for example, where the English forms of grand and petty jury have been introduced, it is observable that there is scarcely a possibility of procuring a conviction where the state is the complaining and injured party, although the facts charged be proved beyond the possibility of cavil. Thus trial by jury can command respect only where there is a deep sense of rectitude, and a disregard of public clamour.

*Habeas Corpus*.—Only the law, not the sovereign or any functionary of government, can imprison the person of a subject, who can reclaim against wrongful or

unconstitutional seizure and incarceration by an action of *habeas corpus*; that is, an action before a competent court to be released, or have the custody of his own person. In periods of civil commotion, the *habeas corpus*, as it is called, or power of replevin, is occasionally suspended by an act of the legislature; by which means the state can imprison without challenge, and dismiss without trial. As may be supposed, this serious infringement of the constitution is resorted to only in extreme cases.

## LAW OF SCOTLAND.

From what has been already said, it will be gathered that the law of Scotland was chiefly composed of the feudal system and the Roman law. The former was in practice according to the form in which it had adapted itself to the peculiar customs of the country, the latter was taken from the doctrines of the civilians. The origin and progress of feudalism in Scotland are very obscure. The chroniclers attribute the foundation of the system to Malcolm II., in the eleventh century, but with little probability. It is more likely that, with the resort of foreigners, Saxon and Norman, to the court of the Scottish king subsequently to the conquest of England, the system was imperceptibly and gradually introduced. The monarchs, who were ambitious of presiding over a distinguished court, gave particular encouragement to the Normans, to whom they granted large fiefs or lordships; and it was natural that they should return the same homage to which they were accustomed in the country of their origin. The whole of the Lowlands, indeed, and a great part of the Highlands, became nearly as thickly adorned with Norman aristocratic names as the broad plains of England; and it was this alien aristocracy that submitted with so much indifference to the claims and encroachments of Edward I. There appear to have been many points on which the earlier laws of the two divisions of the island were identical. In England, however, as we have already seen, the feudal system received many checks, while in Scotland it was allowed to grow rank; and the deference paid to the civil law in the north served to widen the distinction. The alliance and continued intercourse with France, moreover, naturally drew the legal practice in the direction of the example set by that country.

There is little information to be derived concerning the practice of the law in Scotland previous to the sixteenth century. Edward I. probably destroyed some vestiges, through which its history might have been traced; but he seems to have been charged by some antiquaries with the destruction of more than ever existed. He did more, probably, by fabrication than by destruction to poison the sources of Scottish jurisprudence. The earliest alleged collection of the laws, commonly called the *Regiam Majestatem*, bears so near a resemblance to the English work of Glanvil, noticed above, that it is naturally supposed to have been a digest, not of what the laws were, but of what the conqueror wished them to be. The earliest Scottish legal writer whose works are quoted is Balfour, who prepared about the latter end of the sixteenth century, a compendium, chiefly derived from the *Regiam Majestatem*, the acts of parliament, and the decisions of the court. In the reign of James VI., a commission was appointed to make inquiry into the laws, of which the celebrated Sir John Skene was a member. The commissioners collected and published many acts of parliament, the *Regiam Majestatem* and other consuetudinary laws, such as the customs of the royal burghs; and Sir John Skene wrote an interesting treatise on the meaning of technical legal expressions.

The first really scientific writer on the law of Scotland, however, was Sir Thomas Craig, whose book on the feudal law was published in 1655. It is a work of great learning and thought, in which the reader is somewhat surprised to find that, though the work professes to be a Scottish law-book, it should derive so much of its learning from the practice of continental

## HISTORY OF LAWS.

nations. The next great authority is Lord Stair, the equivocal statesman of the reign of James VII., whose Institute, on the model of that of Justinian, is remarkable for the breadth of its legal principles, and the acuteness with which they are practically applied. Soon after the middle of the eighteenth century, a second Institute was prepared by Mr Erskine, professor of Scottish law, more suited to the knowledge of the age than that of Stair, but more dry and formal. Sir Walter Scott has justly denominated Erskine's Institute the Scottish 'Coke upon Lyttleton.' There were formerly few opportunities of acquiring a legal education in Scotland, and it was the practice for the youth studying the Scottish law to repair to one of the continental universities, among which Leyden and Paris were preferred. On the occasion of the appointment to a chair of law in Aberdeen, in the seventeenth century, Spalding the Chronicler says, it was 'strange to see one man admitted to teach the laws, who was never out of the country studying and learning the laws;' thus expressing his astonishment that any man could be presumed to become acquainted with a system of law on the spot where it is administered. The civil law is still professedly studied in Scotland, but its ancient influence has sunk beneath the progress of commerce, and the increase of statutory regulations, which compel the lawyer to spend much of his time with acts of parliament and reports of decisions.

Scotland has a considerable quantity of early statute law, but not nearly so much as England. Down to the time of the Revolution, the general principles only of the acts had the assent of the assembled parliament—the details were all prepared by a committee called the Lords of the Articles. The older acts are remarkable for their brevity and precision, in which respects they greatly excel the clumsy and wordy acts of parliament of the United Kingdom, which, since the Union, has legislated for Scotland, often with little regard to the peculiarities of Scottish practice. According to a usage derived from the civil law, acts of parliament become repealed by disuse in Scotland, technically, get into desuetude—a principle unknown in English law.

The earliest superior tribunals in Scotland, were either the parliament, as the king's great council, or a committee of it, acting with the delegated powers of the whole body. There was likewise, as in England, a king's justiciar, whose authority was vast, and not very well defined, especially in criminal matters. Committees of parliament were, in the fifteenth and the beginning of the sixteenth century, sometimes formed into regular courts of justice, in which, however, a certain degree of fluctuation could not be avoided. In 1532, the present Court of Session was constituted, on the model, it is believed, of the parliament of Paris. The chancellor, whose principal duties disappeared at the Union, was chairman of this body. It consisted of fifteen judges including a president, who was chairman in absence of the chancellor. In 1830, the number of judges was reduced to thirteen; and about the same time, the authority of some other tribunals, the chief of which were the Courts of Admiralty and Exchequer, was transferred to the Court of Session. It consists of two divisions, which are separate tribunals. Some of the judges also act as individual judges in courts of their own, in which capacity they are termed 'lords ordinary.' An ordinary case, on coming into court, is discussed before a lord ordinary, from whose decision there is a reference to one of the divisions of the 'Inner House,' as it is termed, where the remaining judges sit collectively. From them there is an appeal to the House of Lords. There is no such conventional distinction as that between law and equity known in Scotland, and hence English lawyers, who are apt to measure all other systems by their own, absurdly enough speak of the Court of Session as a court 'both of law and equity.' Besides the usual adjudication of litigated cases, there are two very useful descriptions of action peculiar to this court. The one is called an action of 'declarator,' which a person who is puzzled about any difficulty, and is afraid of

committing an illegal act, may bring, to have the law as to the point declared, and his course of action made plain; another is called a 'multiplepoinding,' which may be raised by a man having money in his hands which more than one person is claiming, that he may know to whom he can legally pay it. Trial by jury was not, until very lately, added to the jurisdiction of this court. It is limited to certain descriptions of cases, and is far from popular.

The judges in the Court of Session, the advocates or barristers, the writers to the signet or practising attorneys, and other functionaries, form an institution styled the *College of Justice*.

The principal criminal court is the Court of Justiciary, consisting of seven of the judges of the Court of Session, who sit in Edinburgh, and commission some of their number to hold circuits in the country. The most remarkable peculiarity in Scottish legal usages, is the practice of criminal prosecution, which is clear, simple, and effective. All crimes of a high class are prosecuted at the instance of the *Lord Advocate*, or chief public prosecutor, at the expense of the country. Lesser crimes are prosecuted by *Procurators Fiscal*, of whom one is attached to each sheriffdom. In no case is the party injured put to any trouble or expense. The Lord Advocate, who is appointed by the crown, along with crown-counsel, alone judge of the propriety of prosecuting for crimes, there being no grand jury. The jury before whom cases for trial are brought consists of fifteen persons selected by lot from forty-five summoned jurors, and the decision or verdict is by a majority. The Scottish criminal law is partly statute, partly founded on long usage. There are many offences which, by this latter portion of the law, are punishable with death, if the prosecutor do not restrict the extent of punishment to be awarded, which he now does in almost every case except murder. The sheriffs, or local judges of counties, have important judicial powers, both civil and criminal. The former extends to every description of dispute regarding property, except what refers to land. The powers of these judges have lately received extensive additions, especially in matters of insolvency and bankruptcy. They do not employ a jury, except in criminal cases, in which their power of inflicting punishment does not exceed imprisonment. The *sheriffs* of the Scottish counties are advocates, practising before the supreme courts, not honorary functionaries, as in England. In each county there is, besides, a resident sheriff, or *sheriff-substitute*, who issues warrants and holds civil and criminal courts. To this useful class of functionaries Scotland is much indebted.

In Scotland, there is a usage as absurd as that of granting *rules* in the Queen's Bench prison. A debtor from any part of the United Kingdom may take the benefit of *sanctuary* in Holyrood, a suburb of Edinburgh, including some fine open grounds. While in this sanctuary, and having a written protection, procurable for a fee, the debtor is sheltered against all writs for civil claims, those of the state alone excepted; and he is at liberty to quit this sanctuary during the whole twenty-four hours of Sunday. This is the last existing relic of the privilege of sanctuary in Britain, perhaps in Europe.

There has latterly been some indications of the assimilation of the legal usages of Scotland to those of England, and it is highly desirable that an end should speedily be put to all existing diversities.

### THE FRENCH CODES.

The ancient laws of France were a mixture of the civil, feudal, and canon law. Partly they were the doctrines of the authorities on the civil law, and partly they were the ordinances issued by the various monarchs. By far the greatest portion, however, in bulk, consisted of the peculiar feudal customs of the various provinces. In these the feudal system was sometimes retained in so high a state of purity, that the collections of provincial customs are esteemed excellent authorities on the subject. But it was not merely in each province

that there was a local custom. The power of the crown, or any other paramount legislature, was so feeble, that wherever an assembly of men were held together by one common tie, as where they were co-vassals of one lord, or members of the same civic community, they had in some measure a code of laws of their own. The royal codes, which existed on a large scale, are estimated at about 300, but of the number of inferior local customs it would be impossible to make an estimate. Voltaire observes, that a man travelling through his country has to change laws as often as he has to change horses, and that the most learned barrister in one village will be a complete ignoramus a few miles off. The seigniorial courts were divided into three grades, according to the extent of the penal authority exercised by them. The principal courts of law were the parliaments of the respective provinces. Seats in them were generally held by purchase, or were in the hereditary succession of great families, who thus constituted a species of professional nobility. The decrees of these bodies were often baffled or reversed by the royal authority, exercised in the well-known form of *lettres de cachet*. These alterations of the decisions of the courts, however, were performed not as a judicial revision, but by the simple authority of the king; and thus the parliaments, being subject to no judicial control or responsibility, adhered but slightly to fixed rules of law, and often acted according to their own will and discretion. The jury, even so much of it as may have existed under the old feudal form, had entirely disappeared, and proceedings were conducted in secret. Criminal investigations, instead of terminating in a conclusive trial as in England, were protracted through a lingering succession of written pleadings and secret investigations, from which the accused could never calculate on being free. The torture was extensively employed; but in the general case, only when there was as much circumstantial evidence as would justify a conviction in this country.

The whole of this system was swept suddenly away before the tide of the Revolution, but amid the troubled times that succeeded, it was long ere rulers could find peace and leisure for the erection of a substitute. In 1800, Napoleon appointed a commission to draw up a project of a civil code. The project when prepared was circulated for comment and suggestion, and was afterwards, along with the observations made on it by the different courts of law, discussed in the council of state and the tribunate. Thus was formed the *Code Civil*, or civil code of France, more generally known by the term *Code Napoleon*, which was applied to it under the Empire. Nearly at the same time, and in the same manner, was framed the *Code de Procédure Civile*, or code for regulating the form of process in civil actions, and specifying the jurisdictions of the various courts. Being a subject more connected with technical detail, and involving less of general principle than the civil code, its provisions were left almost entirely to the arrangement of the lawyers. Besides the technical directions in which lawyers are almost wholly interested, there are in this manual many which concern the ordinary proceedings of citizens at large, such as directions for the order to be taken regarding the effects of a deceased person, &c. This code is generally accompanied by a table of fees in law proceedings. In 1807, another code was promulgated, called the *Code de Commerce*, consisting of 648 sections. This is the commercial code of France, regulating partnership, bills and notes, banking, shipping, bankruptcy, &c. By this code provision is made for merchants choosing boards or courts from among their own number, called *Tribunaux de Commerce*. The jurisdiction of these courts, which are very numerous, extends to questions between merchants, and disputes arising out of commercial transactions. In criminal legislation, a different order was pursued from that adopted in the civil; the procedure code was prepared and adopted before the crimes to which it was to apply, and the punishments it was to enforce, were defined. The *Code d'Instruction Criminelle* was promulgated in 1808, and the *Code Pénal* in 1810.

Such were the laws issued under the government of Napoleon, commonly called *Les Cinq Codes*, or the Five Codes. There are other collections of regulations, which should be added to make up a complete body of French laws—a military code, issued by Napoleon; regulations concerning woods and forests, issued under Charles X.; various laws as to the press and theatrical exhibitions, and alterations of the penal code, issued under the government of Louis-Philippe; and lastly, the enactments under the existing republic. It is simply in the Five Codes, however, passed under Napoleon, and confirmed at the Restoration, that the modern laws of France are known to Europe at large. They are generally published in a small, thick, closely-printed volume; and for the conciseness, clearness, and elegance of their language, and their intrinsic merits, they are a favourite subject of study with many British lawyers, while there are few places in civilised Europe in which they are not generally known. Independently of the division into books and sections, the paragraphs in each code are numbered straight on from the commencement, an arrangement which gives peculiar facilities for reference. Thus there are in the civil code 2281 consecutively numbered paragraphs. In a country where the material of the law is so gigantic as it is in England, it is of the highest interest to mark the practical working of this grand effort at simplification. To an unlearned person in this country, it is a much easier thing to know the law of France on any particular point, than the law he is living under. If an English lawyer is asked a question, his answer involves references to commentaries, decisions, and statutes innumerable; but in the general case, the answer of a French lawyer bears simple reference to such a paragraph of such a code.

The French codes adopt the phraseology of the Roman law and many of its principles. The most striking deviation from the previous law of France, and the present system of other countries, is perhaps in the rules respecting succession. The children succeed to equal shares of the parents' property, whether it consist of land or movables; and if there be no legitimate children, illegitimate children may succeed. The parent is limited in the disposal of his property by will. He can only bequeath the half if he have one legitimate child, and the third if he have two. Restrictions somewhat similar are to be found in other countries with respect to movable property, but not as to land. The effect which the extensive partition, naturally occasioned by this law, has effected, and may effect, in France, is a subject of great interest to political economists. In the mercantile law there are several provisions unknown in this country, such as registers for hypothecs or securities held over movable goods or merchandise, and societies 'en commandite,' or partnerships in which certain managing members are responsible for the obligations of the company to the extent of their whole property, while the sleeping partners who advance money are not responsible beyond the amount of their shares. The chief improvement in the criminal law effected during the Revolution, and sanctioned by the code of instruction, was jury trial, to which Napoleon was much opposed: the system, as finally settled, bore more resemblance to the Scottish than to the English form, prosecutions being conducted by public prosecutors, there being no grand jury, and the jury of final trial deciding by a majority. In other respects, the criminal law is more remarkable for its austerity than for its subserviency to the general good of the public. With Napoleon, though that object was not neglected, it was made secondary to the consolidation of his own power; and offences are measured less by their pernicious effects on society at large, than by the trouble or danger they might occasion to rulers. Hence was adopted in many cases the stern and simple method of putting arbitrary power over criminals into the hands of the administrators of the law, while punishments of the highest kind were reserved for offences against the authorities.

# HISTORY OF ANCIENT NATIONS.

As the memory of a man extends back only to some point in his early boyhood, so the memory of our race extends back only to about 3000 years from the present date, leaving an indefinite space before that, during which the infancy of the species must have been transacted. Nor does the Scriptural account of the creation settle this point. As many as two hundred different calculations as to the age of our species have been founded, by different divines, on the statements of the sacred records—the discrepancy arising from the uncertainty of those texts of the Old Testament in which numbers occur. The longest of these calculations dates the creation of man at about 8800 years from the present time, or about 7000 years before the birth of Christ; the shortest at about 5300 years from the present time, or 3500 years before the birth of Christ: the system usually adopted by historians is that of Archbishop Usher, which fixes the event at B.C. 4004, or 5853 years from the present date.

The general consent of mankind points to the region of Central Asia as having been the original seat from which the human race dispersed itself over the globe; and accordingly it is this region, and especially the western portion of it, which we find to have been the theatre of the earliest recorded transactions. In short, it was in Central Asia that the first large mass of ripened humanity was accumulated—a great central nucleus of human life, so to speak, constantly enlarging, and from which emissaries incessantly streamed out over the globe in all directions. In process of time this great central mass having swollen out till it filled Asia and Africa, broke up into three fragments—thus giving parentage to the three leading varieties\* into which ethnographers divide the human species—the Caucasian, the Mongolian, and the Ethiopian or Negro—the Caucasians overspreading southern and western Asia; the Mongolians overspreading northern and eastern Asia; and the Ethiopians overspreading

\* In the *PHYSICAL HISTORY OF MAN* (No. 51), we admitted the five varieties as described by Blumenbach—namely, the Caucasian, Mongolian, Ethiopian, Malay, and American; but in as far as the social or historical progress of the race is concerned, the two latter may be considered as having no existence.

Africa. From these three sources streamed forth branches which, intermingling in various proportions, have constituted the various nations of the earth.

Differing from each other in physiological characteristics, the three great varieties of the human species have differed also widely in their historical career. The germs of a grand progressive development seem to have been implanted specially in the Caucasian variety, the parent stock of all the great civilised nations of ancient and modern times. History, therefore, concerns itself chiefly with this variety: in the evolution of whose destinies the true thread of human progress is to be found. Ere proceeding, however, to sketch the early development of this highly-endowed variety of our species in the nations of antiquity, a few observations may be offered regarding the other two—the Ethiopian and Mongolian—which began the race of life along with the Caucasian, and whose destinies, doubtless, whatever may have been their historical functions hitherto, are involved in some profound and beautiful manner with the bearing of the race as a whole.

## ETHIOPIAN OR NEGRO HISTORY.

A German historian thus sums up all that is known of Ethiopian history—that is, of the part which the great Negro race, inhabiting all Africa with the exception of the north-eastern coasts, performed in the general affairs of mankind in the early ages of the world:—“On the history of this division of the species two remarks may be made: the one, that a now entirely extinct knowledge of the extension and power of this branch of the human family must have been forced upon even the Greeks—their early poets and historians; the other, that the Ethiopian history is interwoven throughout with that of Egypt. As regards the first remark, it is clear that in the earliest ages this branch of the race must have played an important part, since Meroe (in the present Nubia) is mentioned both by Herodotus (B.C. 408) and Strabo (A.D. 20); by the one as a still-existing, by the other as a formerly-existing seat of royalty, and centre of the Ethiopian religion and civilisation.” To this Strabo adds, that the race

\* Some years ago, a traveller, Mr G. A. Hoskins, visited the site of this capital state of ancient Ethiopia, an island, if it may be so called, about 300 miles long, enclosed within two forking branches of the Nile. He found in it several distinct groups of magnificent pyramidal structures. Of one ruin he says—“Never were my feelings more ardently excited than in approaching, after so tedious a journey, to this magnificent necropolis. The appearance of the pyramids in the distance announced their importance; but I was gratified beyond my most sanguine expectations when I found myself in the midst of them. The pyramids of Gizeh are magnificent, wonderful from their stupendous magnitude; but for picturesque effect and elegance of architectural design, I infinitely prefer those of Meroe. I expected to find few such remains here, and certainly nothing so imposing, so interesting, as these sepulchres, doubtless of the kings and queens of Ethiopia. I stood for some time lost in admiration. This, then, was the necropolis, or city of the dead! But where was the city itself, Meroe, its temples and palaces? A large space, about 2000 feet in length, and the same distance from the river, strewed with burnt brick and with some fragments of walls, and stones similar to those used in the erection of the pyramids, formed, doubtless, part of that celebrated site. The idea that this is the exact situation of the city is strengthened by the remark of Strabo, that the walls of the habitations were built of bricks. These indicate, without doubt, the site of that cradle of the arts which distinguish a civilised from a barbarous society. Of the birthplace of the arts and sciences, the wild natives of the adjacent villages have made a miserable burying-place: of the city of the learned—“its cloud-capt towers,” its “gorgeous palaces,” its “solemn temples,”

spread from the boundaries of Egypt over the mountains of Atlas, as far as the Gaditanian Straits. Ephorus, too (B. C. 405), seems to have had a very great impression of the power of the Ethiopians, since he names in the east the Indians, in the south the Ethiopians, in the west the Celts, in the north the Scythians, as the most mighty and numerous peoples of the known earth. Already in Strabo's time, however, their ancient power had been gone for an indefinite period, and the Negro states found themselves, after Meroe had ceased to be a religious capital, almost in the same situation as that in which they still continue. The second remark on the Negro branch of the human race and its history, can only be fully elucidated when the interpretation of the inscriptions on Egyptian monuments shall have been farther advanced. The latest travels into Abyssinia show this much—that at one time the Egyptian religion and civilisation extended over the principal seat of the northern Negroes. Single mummies and monumental figures corroborate what Herodotus expressly says, that a great portion of the Egyptians of his time had black skins and woolly hair; hence we infer that the Negro race had combined itself intimately with the Caucasian part of the population. Not these notices only, but the express testimonies also of the Hebrew annals, show Egypt to have contained an abundance of Negroes, and mention a conquering king invading it at the head of a Negro host, and governing it for a considerable time. The nature of the accounts on which we must found does not permit us to give an accurate statement; we remark, however, that the Indians, the Egyptians, and the Babylonians, are not the only peoples which aimed at becoming world-conquerors before the historic age, but that also to the Ethiopian stock warlike kings were not wanting in the early times. The Mongols alone seem to have enjoyed a happy repose within their own seats in the primitive historic times, and those antecedent to them; they appear first very late as conquerors and destroyers in the history of the west. If, indeed, the hero-king of the Ethiopians, Tearcho, were one and the same with the Tirhakah of the Book of Kings (2 Kings, xix, 9), then the wonder of those stories would disappear which were handed down by tradition to the Greeks; but even Bochart has combated this belief, and we cannot reconcile it with the circumstances which are related of both. It remains for us only to observe, by way of summary, that in an age antecedent to the historic, the Ethiopian peoples may have been associated together in a more regular manner than in our or Grecian and Roman times; and that their distant expeditions may have been so formidable, both to the Europeans as far as the Egean Sea in the east, and to the dwellers on the Gaditanian Straits (Gibraltar) on the west, that the dim knowledge of the fact was not lost even in late times. In more recent ages we observe here and there an Ethiopian influence, and especially in the Egyptian history; but as concerns the general progress of the human species, the Negro race never acquired any vital importance.\*

The foregoing observations may be summed up in this proposition:—That in the most remote antiquity, Africa was overpread by the Negro variety of the human species; that in those parts of the continent to which the knowledge of the ancient geographers did not extend—namely, all south of Egypt and the Great Desert—the Negro race degenerated, or at least dispersed into tribes, kingdoms, &c. constituting a great savage system within its own torrid abode, similar to that which even now, in the adult age of the world, we are vainly attempting to penetrate; but that on the coasts of the Mediterranean and the Red Sea, the race either

there is "left not a rack behind." The sepulchres alone of her departed kings have fulfilled their destination of surviving the habitations which their philosophy taught them to consider but as inns, and are now fast mouldering into dust. Scarcely a trace of a palace or a temple is to be seen.

\* Schlosser's (F. C.) *Universalthistorische Uebersicht der Geschichte der Alten Welt und ihrer Cultur.*

preserved its original faculty and intelligence longer, or was so improved by contact and intermixture with its Caucasian neighbours, as to constitute, under the name of the Ethiopians, one of the great anti-historic dynasties of the world; and that this dynasty ebbed and flowed against the Caucasian populations of western Asia and eastern Europe, thus giving rise to mixture of races along the African coasts of the north and east, until at length, leaving these mixed races to act their part awhile, the pure Ethiopian himself retired from historic view into Central Africa, where he lay concealed, till again in modern times he was dragged forth to become the slave of his Caucasian brother. Thus Negro history, hitherto, has exhibited a retrogression from a point once occupied, rather than a progress in civilisation. Even this fact, however, must somehow be subordinate to a great law of general progress; and it is gratifying to know that, on the coast of Africa, a settlement has recently been formed called Liberia, peopled by liberated negro slaves from North America; and who, bringing with them the Anglo-American civilisation, give promise of founding a cultured and prosperous community.

MONGOLIAN HISTORY—THE CHINESE.

As from the great central mass of mankind, the first accumulation of life on our planet, there was parted off into Africa a fragment called the Negro variety, so into eastern Asia there was detached, by those causes which we seek in vain to discover, a second huge fragment, to which has been given the name of the Mongolian variety. Overspreading the great plains of Asia, from the Himalahs to the Sea of Okhotsk, this detachment of the human species may be supposed to have crossed into Japan; to have reached the other islands of the Pacific, and either through these, or by the access at Behring's Straits, to have poured themselves through the great American continent; their peculiarities shading off in their long journey, till the Mongolian was converted into the American Indian. Blumenbach, however, erects the American Indian into a type by himself, as already shown in No. 51.

Had historians been able to pursue the Negro race into their central African jungles and deserts, they would no doubt have found the general Ethiopic mass breaking up there under the operation of causes connected with climate, soil, food, &c. into vast sections or subdivisions, presenting marked differences from each other; and precisely so was it with the Mongolians. In Central Asia, we find them as Thibetians, Tungusians, Mongols proper; on the eastern coasts, as Manchous and Chinese; in the adjacent islands, as Japanese, &c.; and nearer the North Pole, as Laplanders, Esquimaux, &c.; all presenting peculiarities of their own. Of these great Mongolian branches circumstances have given a higher degree of development to the Chinese and the Japanese than to the others, which are chiefly nomadic hordes, some under Chinese rule, others independent, roaming over the great pasture lands of Asia, and employed in rearing cattle.

There is every reason to believe that the vast population inhabiting that portion of eastern Asia called China, can boast of a longer antiquity of civilisation than almost any other nation of the world; a civilisation, however, differing essentially in its character from those which have appeared and disappeared among the Caucasians. This, in fact, is to be observed as the grand difference between the history of the Mongolian and that of the Caucasian variety of the human species, that whereas the former presents us with the best product of Mongolian humanity, in the form of one great permanent civilisation—the Chinese—extending from century to century, one, the same, and solitary, through a period of 3000 or 4000 years; the latter exhibits a succession of civilisations—the Chaldean, the Persian, the Grecian, the Roman, the modern European (subdivided into French, English, German, Italian, &c.), and the Anglo-American; these civilisations, from the remotest Oriental—that is, Chaldean—to the most

recent occidental—that is, the Anglo-American—being a series of waves falling into each other, and driven onward by the same general force. A brief sketch of Chinese history, with a glance at Japan, will therefore discharge all that we owe to the Mongolian race.

Authentic Chinese history does not extend farther back than about 800 or 1000 years B.C.; but, as has been the case more or less with all nations, the Chinese imagination had provided itself with a mythological history extending many ages back into the unknown past. Unlike the mythology of the Greeks, but like that of the Indians, the Chinese legends deal in large chronological intervals. First of all, in the beginning of time, was the great Puan-Koo, the founder of the Chinese nation, and whose dress was green leaves. After him came Ty-en-Hoang, Ti-Hoang, Gin-Hoang, and several other euphonious potentates, each of whom did something great towards the building up of the Chinese nation, and each of whom reigned, as was the custom in these grand old times, thousands of years. At length, at a time corresponding to that assigned in Scripture to the life of Noah, came the divine-born Fohi, a man of transcendent faculties, who reigned 115 years, teaching music and the system of symbols, instituting marriage, building walls round cities, creating mandarins, and, in short, establishing the Chinese nation on a basis that could never be shaken. After him came Shin-ning, Whang-ti, &c. until in due time came the good emperors Yao and Shun, in the reign of the latter of whom happened a great flood. By means of canals and drains the assiduous Yu saved the country, and became the successor of Shun. Yu was the first emperor of the Hia dynasty, which began about 2100 B.C. After this dynasty came that of *Shang*, the last of whose emperors, a great tyrant, was deposed (B.C. 1122) by Woo-wong, the founder of the Tchow dynasty.

In this Tchow dynasty, which lasted upwards of 800 years, authentic Chinese history commences. It was during it, and most probably about the year B.C. 484, that the great Con-fu-tse, or Confucius, the founder of the Chinese religion, philosophy, and literature, flourished. In the year B.C. 248, the Tchow dynasty was superseded by that of Tsin, the first of whose kings built the Great Wall of China, to defend the country against the Tartar nomads. The Tsin dynasty was a short one: it was succeeded in B.C. 206 by the Han dynasty, which lasted till A.D. 238. Then followed a rapid series of dynastic revolutions, by which the nation was frequently broken into parts; and during which the population was considerably changed in character by the irruptions of the nomad hordes of Asia who intermingled with it. Early in the seventh century, a dynasty called that of Tang acceded to power, which ended in 897. After half a century of anarchy, order was restored under the Song dynasty, at the commencement of which, or about the year 950, the art of printing was discovered, five centuries before it was known in Europe. 'The Song dynasty,' says Schlosser, 'maintained an intimate connection with Japan, as contrary to all Chinese maxims; the emperors of this dynasty imposed no limits to knowledge, the arts, life, luxury, and commerce with other nations. Their unhappy fate, therefore (on being extinguished with circumstances of special horror by the Mongol conqueror Kublai Khan, A.D. 1281), is held forth as a warning against departing a hairsbreadth from the old customs of the empire. From the time of the destruction of the Song dynasty by the Mongol monarchy, the intercourse between China and Japan was broken, until again the Ming, a native Chinese dynasty (A.D. 1366) restored it. The Mongol rulers made an expedition against Japan, but were unsuccessful. The unfortunate gift which the Japanese received from China was the doctrine of Fohi. This doctrine, however, was not the first foreign doctrine or foreign worship that came into China. A religion, whose nature we cannot fix—probably Buddhism, ere it had assumed the form of Lamaism—was preached in it at an earlier date. About the time of the Tsin dynasty (B.C. 248–206), a

warlike king had incorporated all China into one, and subdued the princes of the various provinces. While he was at war with his subjects, many of the roving hordes to the north of China pressed into the land, and with them appeared missionaries of the religion above-mentioned. When peace was restored, the kings of the fore-named dynasty, as also later those of Han and the two following dynasties, extended the kingdom prodigiously, and the western provinces became known to the Greeks and Romans as the land of the *Zeror*. As on the one side Tartary was at that time Chinese, so on the other side the Chinese were connected with India; whence came the Indian religion. It procured many adherents, but yielded at length to the primitive habits of the nation. In consequence of the introduction of the religion of Fohi, the immense country fell asunder into two kingdoms. The south and the north had each its sovereign; and the wars of the northern kingdom occasioned the wanderings of the Huns, by whose agency the Roman Empire was destroyed. These kingdoms of the north and south were often afterwards united and again dissevered; great savage hordes roamed around them as at present; but all that had settled, and that dwelt within the Great Wall, submitted to the ancient Chinese civilisation. Ghenghis Khan, indeed, whose power was founded on the Turkish and Mongol races, annihilated both kingdoms, and the barbaric element seemed to triumph; but this was changed as soon as his kingdom was divided. Even Kublai, and yet more his immediate followers, such as the Chinese calumniate the Mongol dynasty of Yeven, maintained everything in its ancient condition, with the single exception that they did homage to Lamaism, the altered form of Buddhism. This religion yet prevails, accommodated skilfully, however, to the Chinese mode of existence—a mode which all subsequent conquerors have respected, as the example of the present dynasty proves.' The dynasty here alluded to is that of *Tsain*, of Mantchou, a mixed Mongol and Tartar stock, which superseded the native Chinese dynasty of Ming in the year 1644. The present emperor of China is the sixth of the *Tsain* dynasty.

From the series of dry facts just given, we arrive at the following definition of China and its civilisation:—As the Roman Empire was a great temporary aggregation of matured Caucasian humanity, surrounded by and shading off into Caucasian barbarism, so China, a country more extensive than all Europe, and inhabited by a population of more than 300,000,000, is an aggregation of matured Mongolian humanity surrounded by Mongolian barbarism. The difference is this, that while the Roman Empire was only one of several successive aggregations of the Caucasian race, each on an entirely different basis, the Chinese empire has been one permanent exhibition of the only form of civilisation possible among the Mongolians. The Jew, the Greek, the Roman, the Frenchman, the German, the Englishman—these are all types of the matured Caucasian character; but a fully-developed Mongolian has but one type—the Chinese. Chinese history does not exhibit a progress of the Mongolian man through a series of stages: it exhibits only a uniform duration of one great civilised Mongolian empire, sometimes expanding so as to extend itself into the surrounding Mongolian barbarism, sometimes contracted by the pressure of that barbarism, sometimes disturbed by infusions of the barbaric element, and sometimes shattered within itself by the operation of individual Chinese ambition, but always retaining its essential character. True, in such a vast empire, difference of climate, &c. must give rise to specific differences, so that a Chinese of the north-east is not the same as a Chinese of the south-west; true, also, the Japanese civilisation seems to exist as an alternative, between which and the Chinese Providence might share the Mongolian part of our species were it to remain unmixed; still the general remark remains undeniable, that from the remotest antiquity to the present day, Mongolian humanity has been able to cast itself but into one essential civilised type. It is an

object of peculiar interest, therefore, to us who belong to the multiform and progressive Caucasian race, to obtain a distinct idea of the nature of that permanent form of civilisation out of which our Mongolian brothers have never issued, and apparently never wish to issue. Each of our readers being a civilised Caucasian, may be supposed to ask, 'What sort of a human being is a civilised Mongolian?' A study of the Chinese civilisation would answer this question. Not so easy would it be for a Chinese to return the compliment, confused as he would be by the multiplicity of the types which the Caucasian man has assumed—from the ancient Arab to the modern Anglo-American.

Hitherto little progress has been made in the investigation of the Chinese civilisation. Several conclusions of a general character have, however, been established. 'We recognise,' says Schlosser, 'in the institutions of the Chinese, so much praised by the Jesuits, the character of the institutions of all early states; with this difference, that the Chinese mode of life is not a product of hierarchical or theocratic maxims, but a work of the cold understanding. In China, all that subserves the wants of the senses was arranged and developed in the earliest ages; all that concerns the soul or the imagination is yet raw and ill-adjusted; and we behold in the high opinion which the Chinese entertain of themselves and their affairs, a terrible example of what must be the consequence when all behaviour proceeds according to prescribed etiquette, when all knowledge and learning is a matter of rote directed to external applications, and the men of learning are so intimately connected with the government, and have their interest so much *one* with it, that a number of privileged doctors can regulate literature as a state magistrate does weights and measures.' Of the Chinese government the same authority remarks—'The patriarchal system still lies at the foundation of it. Round the "Son of Heaven," as they name the highest ruler, the wise of the land assemble as round their counsellor and organ. So in the provinces (of which there are eighteen or nineteen, each as large as a considerable kingdom), the men of greatest sagacity gather round the presidents; each takes the fashion from his superior, and the lowest give it to the people. Thus one man exercises the sovereignty; a number of learned men gave the law, and invented in very early times a symbolical system of syllabic writing, suitable for their monosyllabic speech, in lieu of their primitive system of hieroglyphics. All business is transacted in writing, with minuteness and pedantry. Their written language is very difficult; and as it is possible in Chinese writing for one to know all the characters of a certain period of time, or of a certain department, and yet be totally unacquainted with those of another period or another department, there is no end to their mechanical acquisition.' It has already been mentioned that Chinese thought has at various times received certain foreign tinctures, chiefly from India; essentially, however, the Chinese mind has remained as it was fixed by Confucius. 'In China,' says Schlosser, 'a so-named philosophy has accomplished that which in other countries has been accomplished by priests and religions. In the genuine Chinese books of religion, in all their learning and wisdom, God is not thought of; religion, according to the Chinese and their oracle and law-giver Con-fu-tse, has nothing to do with the imagination, but consists alone in the performance of outward moral duties, and in zeal to further the ends of state. Whatever lies beyond the plain rule of life is either a sort of obscure natural philosophy, or a mere culture for the people, and for any who may feel the want of such a culture. The various forms of worship which have made their way into China are obliged to restrict themselves, to bow to the law, and to make their practices conform: they can arrogate no literature of their own; and, good or bad, must learn to agree with the prevailing atheistic Chinese manner of thought.'

Such are the Chinese, and such have they been for 2000 or 3000 years—a vast people undoubtedly civi-

lised to the highest pitch of which Mongolian humanity is susceptible; of mild disposition; industrious to an extraordinary degree; well-skilled in all the mechanical arts, and possessing a mechanical ingenuity peculiar to themselves; boasting of a language quite singular in its character, and of a vast literature; respectful of usage to such a degree as to do everything by pattern; attentive to the duties and civilities of life, but totally devoid of fervour, originality, or spirituality; and living under a form of government which has been very happily designated a pedantocracy—that is, a hierarchy of erudite persons selected from the population, and appointed by the emperor, according to the proof they give of their capacity, to the various places of public trust. How far these characteristics, or any of them, are inseparable from a Mongolian civilisation, would appear more clearly if we knew more of the Japanese. At present, however, there seems little prospect of any reorganisation of the Chinese mind, except by means of a Caucasian stimulus applied to it. And what Caucasian stimulus will be sufficient to break up that vast Mongolian mass, and lay it open to the general world-influences? Will the stimulus come from Europe; or from America, after its western shores are peopled, and the Anglo-Americans begin to think of crossing the Pacific?

#### CAUCASIAN HISTORY.

While the Negro race seems to have retrograded from its original position on the earth, while the Mongolian has afforded the spectacle of a single permanent and pedantic civilisation retaining millions within its grasp for ages in the extreme east of Asia, the Caucasian, as if the seeds of the world's progress had been implanted in it, has worked out for itself a splendid career on an ever-shifting theatre. First attaining its maturity in Asia, the Caucasian civilisation has shot itself westward, if we may so speak, in several successive throes; long confined to Asia; then entering northern Africa, where, commingling with the Ethiopian, it originated a new culture; again, about the year B.C. 1000, adding Europe to the stage of history; and lastly, 2500 years later, crossing the Atlantic, and meeting in America with a diffused and degenerate Mongolism. To understand this beautiful career thoroughly, it is necessary to observe the manner in which the Caucasians disseminated themselves from their central home—to count, as it were, and note separately, the various flights by which they emigrated from the central hive. So far as appears, then, from investigations into language, &c. the Caucasian stock sent forth at different times in the remote past five great branches from its original seat, somewhere to the south of that long chain of mountains which commences at the Black Sea, and, bordering the southern coast of the Caspian, terminates in the Himalahs. In what precise way, or at what precise time, these branches separated themselves from the parent stock and from each other, must remain a mystery; a sufficiently clear general notion of the fact is all that we can pretend to. 1st, The Armenian branch, remaining apparently nearest the original seat, filled the countries between the Caspian and Black Seas, extending also round the Caspian into the territories afterwards known as those of the Parthians. 2d, The Indo-Persian branch, which extended itself in a southern and eastern direction from the Caspian Sea, through Persia and Cabool, into Hindoostan, also penetrating Bokhara. From this great branch philologists and ethnographers derive those two races, the distinction between which, although subordinate to the grand fivefold division of the Caucasian stock, is of immense consequence in modern history—the Celtic and the Germanic. Pouring through Asia Minor, it is supposed that the Indo-Persian family entered Europe through Thrace, and ultimately, through the operation of those innumerable causes which react upon the human constitution from the circumstances in which it is placed, assumed the character of Celts and Germans—the Celts being the earlier product, and eventually occupying the

western portion of Europe—namely, northern Italy, France, Spain, and Great Britain—still undergoing subdivision, however, during their dispersion into Iberians, Gaels, Cymri, &c.; the Germans being a later off-shoot, and settling rather in the centre and north of Europe in two great moieties—the Scandinavians and the Germans Proper. This seems the most plausible pedigree of the Celtic and Germanic races, although some object to it. 3d, The Semitic or Aramaic branch, which, diffusing itself southward and westward from the original Caucasian seat, filled Syria, Mesopotamia, Arabia, &c. and founded the early kingdoms of Assyria, Babylonia, Phœnicia, Palestine, &c. It was this branch of the Caucasian variety which, entering Africa by the Isthmus of Suez and the Straits of Babelmandeb, constituted itself an element at least in the ancient population of Egypt, Nubia, and Abyssinia; and there are ethnographers who believe that the early civilisation which lined the northern coasts of Africa arose from some extremely early blending of the Ethiopic with the Semitic, the latter acting as a dominant caste. Diffusing itself westward along the African coast as far as Mauritania, the Semitic race seems eventually, though at a comparatively late period, to have met the Celtic, which had crossed into Africa from Spain; and thus, by the infusion of Arameans and Celts, that white or tawny population which we find in northern Africa in ancient times, distinct from the Ethiopians of the interior, seems to have been formed. 4th, The Pelagic branch, that noble family which, carrying the Greeks and Romans in its bosom, poured itself from western Asia into the south-east of Europe, mingling doubtless with Celts and Germans. 5th, The Scythian, or Slavonic branch, which diffused itself over Russia, Siberia, and the central plains of Asia, shading off in these last into the Mongolian.

Such is a convenient division of the Caucasian stock; a more profound investigation, however, might reduce the five races to these two—the Semitic and the Indo-Germanic; all civilised languages being capable, it is said, of being classified under these three families—the Chinese, which has monosyllabic roots; the Indo-Germanic (Sanskrit, Hindoostanee, Greek, Latin, German, and all modern European languages), which has dissyllabic roots; and the Semitic (Hebrew, Arabic, &c.), whose roots are trisyllabic. Retaining, however, the fivefold distribution which we have adopted, we shall find that the history of the world, from the earliest to the remotest times, has been nothing else than the common Caucasian vitality presenting itself in a succession of phases or civilisations, each differing from the last in the proportions in which it contains the various separate elements.

It is advisable to sketch first the most eastern Caucasian civilisation—that is, that of India; and then to proceed to a consideration of the state of that medley of nations, some of them Semitic, some of them Indo-Persian, and some of them Armenian, out of which the great Persian empire arose, destined to continue the historic pedigree of the world into Europe, by transmitting its vitality to the Pelasgians.

#### Ancient India.

One of the great branches, we have said, of the Caucasian family of mankind was the Indo-Persian, which, spreading out in the primeval times from the original seat of the Caucasian part of the human species, extended itself from the Caspian to the Bay of Bengal, where, coming into contact with the southern Mongolians, it gave rise, according to the most probable accounts, to those new mixed Caucasian-Mongolian races, the Malays of the Eastern Peninsula; and, by a still farther degeneracy, to the Papuas, or natives of the South Sea Islands. While thus shading off into the Mongolism of the Pacific, the Indo-Persian mass of our species was at the same time attaining maturity within itself; and as the first ripened fragment of the Mongolians had been the Chinese nation, so one of the first ripened fragments of the Indo-Persian branch of the

Caucasians seems to have been the Indians. At what time the vast peninsula of Hindoostan could first boast of a civilised population, it is impossible to say; all testimony, however, agrees in assigning to Indian civilisation a most remote antiquity. Another fact seems also to be tolerably well authenticated regarding ancient India; namely, that the northern portions of it, and especially the north-western portions, which would be nearest the original Caucasian seat, were the first civilised; and that the civilising influence spread thence southwards to Cape Comorin.

Notwithstanding this general conviction, that India was one of the first portions of the earth's surface that contained a civilised population, few facts in the ancient history of India are certainly known. We are told, indeed (to omit the myths of the Indian Bacchus and Hercules), of two great kingdoms—those of Ayodha (Oude) and Prathisthana (Vitera)—as having existed in northern India upwards of a thousand years before Christ; of conquests in southern India, effected by the monarchs of these kingdoms; and of wars carried on between these monarchs and their western neighbours the Persians, after the latter had begun to be powerful. All these accounts, however, merely resolve themselves into the general information, that India, many centuries before Christ, was an important member in the family of Asiatic nations; supplying articles to their commerce, and involved in their agitations. Accordingly, if we wish to form an idea of the condition of India prior to that great epoch in its history—its invasion by Alexander the Great, B.C. 326—we can only do so by reasoning back from what we know of its present condition, allowing for the modifying effects of the two thousand years which have intervened; and especially for the effects produced by the Mohammedan invasion, A.D. 1000. This, however, is the less difficult in the case of such a country as India, where the permanence of native institutions is so remarkable; and though we cannot hope to acquire a distinct notion of the territorial divisions, &c. of India in very ancient times, yet, by a study of the Hindoos as they are at present, we may furnish ourselves with a tolerably accurate idea of the nature of that ancient civilisation which overspread Hindoostan many centuries before the birth of Christ—and this all the more probably that the notices which remain of the state of India at the time of the invasion of Alexander, correspond in many points with what is to be seen in India at the present day.

The population of Hindoostan, the area of which is estimated at about a million square miles, amounts to about 120,000,000; of whom about 100,000,000 are Hindoos or aborigines, the remainder being foreigners, either Asiatic or European. The most remarkable feature in Hindoo society is its division into castes. The Hindoos are divided into four great castes—the *Brahmins*, whose proper business is religion and philosophy; the *Kshatriyas*, who attend to war and government; the *Vaisyas*, whose duties are connected with commerce and agriculture; and the *Sudras*, or artisans and labourers. Of these four castes the Brahmins are the highest; but a broad line of distinction is drawn between the Sudras and the other three castes. The Brahmins may intermarry with the three inferior castes—the *Kshatriyas* with the *Vaisyas* and the *Sudras*; and the *Vaisyas* with the *Sudras*; but no *Sudra* can choose a wife from either of the three superior castes. As a general rule, every person is required to follow the profession of the caste to which he belongs: thus the Brahmin is to lead a life of contemplation and study, subsisting on the contributions of the rich; the *Kshatriya* is to occupy himself in civil matters, or to pursue the profession of a soldier; and the *Vaisya* is to be a merchant or a farmer. In fact, however, the barriers of caste have in innumerable instances been broken down. The ramifications, too, of the caste system are infinite. Besides the four pure, there are numerous mixed castes, all with their prescribed ranks and occupations. A class far below even the pure *Sudras* is the *Pariahs* or outcasts; consisting of the refuse of all the

other castes, and which, in process of time, has grown so large as to include, it is said, one-fifth of the population of Hindoostan. The Pariahs perform the meanest kinds of manual labour. This system of castes, of which the Brahmins themselves, whom some suppose to have been originally a conquering race, are the architects, if not the founders, is bound up with the religion of the Hindoos. Indeed of the Hindoos, more truly than of any other people, it may be said that a knowledge of their religious system is a knowledge of the people themselves.

The Vedas, or ancient sacred books of the Hindoos, distinctly set forth the doctrine of the Infinite and Eternal Supreme Being. According to the Vedas, there is 'one unknown, true Being, all present, all powerful, the creator, preserver, and destroyer of the universe.' This Supreme Being 'is not comprehensible by vision, or by any other of the organs of sense; nor can he be conceived by means of devotion or virtuous practices.' He is not space, nor air, nor light, nor atoms, nor soul, nor nature: he is above all these, and the cause of them all. He 'has no feet, but extends everywhere; has no hands, but holds everything; has no eyes, yet sees all that is; has no ears, yet hears everything that passes. His existence had no cause. He is the smallest of the small and the greatest of the great; and yet is, in fact, neither small nor great.' Such is the doctrine of the Vedas in its purest and most abstract form; but the prevailing theology which runs through them is what is called *Pantheism*, or that system which speaks of God as the soul of the universe, or as the universe itself. Accordingly, the whole tone and language of the highest Hindoo philosophy is Pantheistic. As a rope, lying on the ground, and mistaken at first view for a snake, is the cause of the idea or conception of the snake which exists in the mind of the person looking at it, so, say the Vedas, is the Deity the cause of what we call the universe. 'In him the whole world is absorbed; from him it issues; he is entwined and interwoven with all creation.' 'All that exists is God: whatever we smell, or taste, or see, or hear, or feel, is the Supreme Being.'

This one incomprehensible Being, whom the Hindoos designate by the mystical names *Om*, *Tut*, and *Jut*, and sometimes also by the word *Brahm*, is declared by the Vedas to be the only proper object of worship. Only a very few persons of extraordinary gifts and virtues, however, are able, it is said, to adore the Supreme Being—the great *Om*—directly. The great majority of mankind are neither so wise nor so holy as to be able to approach the Divine Being himself, and worship him. It being alleged that persons thus unfortunately disqualified for adoring the invisible Deity should employ their minds upon some visible thing, rather than suffer them to remain idle, the Vedas direct them to worship a number of inferior deities, representing particular acts or qualities of the Supreme Being; as, for instance, *Crishnu* or *Vishnu*, the god of preservation; *Muhadev*, the god of destruction; or the sun, or the air, or the sea, or the human understanding; or, in fact, any object or thing which they may choose to represent as God. Seeing, say the Hindoos, that God pervades and animates the whole universe, everything, living or dead, may be considered a portion of God, and as such, it may be selected as an object of worship, provided always it be worshipped only as constituting a portion of the Divine Substance. In this way, whatever the eye looks on, or the mind can conceive, whether it be the sun in the heavens or the great river Ganges, or the crocodile on its banks, or the cow, or the fire kindled to cook food, or the Vedas, or a Brahmin, or a tree, or a serpent—all may be legitimately worshipped as a fragment, so to speak, of the Divine Spirit. Thus there may be many millions of gods to which Hindoos think themselves entitled to pay divine honours. The number of Hindoo gods is calculated at 330,000,000, or about three times the number of their worshippers.

Of these, the three principal deities of the Hindoos

are *Brahma* the creator, *Vishnu* the preserver, and *Seeb* or *Siva* the destroyer. These three of course were originally intended to represent the three great attributes of the *Om* or Invisible Supreme Being—namely, his creating, his preserving, and his destroying attributes. Indeed the name *Om* itself is a compound word, expressing the three ideas of creation, preservation, and destruction, all combined. The three together are called *Trimurti*, and there are certain occasions when the three are worshipped conjointly. There are also sculptured representations of the *Trimurti*, in which the busts of *Brahma*, *Vishnu*, and *Siva* are cut out of the same mass of stone. One of these images of the *Trimurti* is found in the celebrated cavern temple of *Elephanta*, in the neighbourhood of *Bombay*, perhaps the most wonderful remnant of ancient Indian architecture. *Vishnu* and *Siva* are more worshipped separately than *Brahma*—each having his body of devotees specially attached to him in particular.

Hindooism, like other Pantheistic systems, teaches the doctrine of the transmigration of souls: all creation, animate and inanimate, being, according to the Hindoo system, nothing else but the deity *Brahm* himself parcelled out, as it were, into innumerable portions and forms (when these are reunited, the world will be at an end), just as a quantity of quicksilver may be broken up into innumerable little balls or globules, which all have a tendency to go together again. At long intervals of time, each extending over some thousand millions of years, *Brahm* does bring the world to an end, by reabsorbing it into his spirit. When, therefore, a man dies, his soul, according to the Hindoos, must either be absorbed immediately into the soul of *Brahm*, or it must pass through a series of transmigrations, waiting for the final absorption, which happens at the end of every universe, or at least until such time as it shall be prepared for being reunited with the Infinite Spirit. The former of the two is, according to the Hindoos, the highest possible reward: to be absorbed into *Brahm* immediately upon death, and without having to undergo any farther purification, is the lot only of the greatest devotees. To attain this end, or at least to avoid degradation after death, the Hindoos, and especially the Brahmins, who are naturally the most intent upon their spiritual interests, practise a ritual of the most intricate and ascetic description, carrying religious ceremonies and antipathies with them into all the duties of life. So overburdened is the daily life of the Hindoos with superstitious observances with regard to food, sleep, &c. that, but for the speculative doctrines which the more elevated minds among the Brahmins may see recognised in their religion, the whole system of Hindooism might seem a wretched and grotesque polytheism.

A hundred millions of people professing this system, divided into castes as now, and carrying the Brahminical ritual into all the occupations of lazy life under the hot sun, and amid the exuberant vegetation of Hindoostan—such was the people into which *Alexander the Great* carried his conquering arms; such, doubtless, they had been for ages before that period; and such did they remain, shut out from the view of the rest of the civilised world, and only communicating with it by means of spices, ivory, &c. which found their way through *Arabia* or the *Red Sea* to the *Mediterranean*, till *Vasco de Gama* rounded the *Cape of Good Hope*, and brought *Europe* and *India* into closer connection. Meanwhile a *Mohammedan* invasion had taken place (A.D. 1000); *Mohammedans* from *Persia* had mingled themselves with the Hindoos; and it was with this mixed population that *British* enterprise eventually came into collision.

Ere quitting the Indians, it is well to glance back at the Chinese, so as to see wherein these two primal and contemporaneous consolidations of our species—the *Mongolian* consolidation of eastern *Asia*, and the *Caucasian* consolidation of the central peninsula of southern *Asia*—differ. 'Whoever would perceive the full physical and moral difference,' says *Klaproth*,

## HISTORY OF ANCIENT NATIONS.

between the Chinese and Indian nations, must contrast the peculiar culture of the Chinese with that of the Hindoo, fashioned almost like a European, even to his complexion. He will study the boundless religious system of the Brahmins, and oppose it to the bold belief of the original Chinese, which can hardly be named religion. He will remark the rigorous division of the Hindoos into castes, sects, and denominations, for which the inhabitants of the central kingdom have even no expression. He will compare the dry prosaic spirit of the Chinese with the high poetic soul of the dwellers on the Ganges and the Dsumnah. He will hear the rich and blooming Sanscrit, and contrast it with the unharmonious speech of the Chinese. He will mark, finally, the literature of the latter, full of matters of fact and things worth knowing, as contrasted with the limitless philosophic-ascetic writing of the Indians, who have made even the highest poetry wearisome by perpetual length.\*

### History of the Eastern Nations till their Incorporation in the Persian Empire.

Leaving India—that great fragment of the original Caucasian civilisation—and proceeding westward, we find two large masses of the human species filling in the earliest times the countries lying between the Indus and the Mediterranean—namely, an Indo-Persian mass filling the whole tract of country between the Indus and the Tigris; and a Semitic-Aramaic mass filling the greater part of lesser Asia and the whole peninsula of Arabia, and extending itself into the parts of Africa adjoining the Red Sea. That in the most remote ages these lands were the theatres of a civilised activity is certain, although no records have been transmitted from them to us, except a few fragments relative to the Semitic nations. The general facts, however, with regard to these ante-historic times, seem to be: 1st, That the former of the two masses mentioned—namely, the population between the Indus and the Caspian—was essentially a prolongation of the great Indian nucleus, possessing a culture similar to the Indian in its main aspects, although varied, as was inevitable, by the operation of those physical causes which distinguish the climate of Persia and Cabool from that of Hindoostan; 2d, That the Semitic or Aramaic mass divided itself at a very early period into a number of separate peoples or nations, the Assyrians, the Babylonians, the Phœnicians, the Jews, the Arabians, &c. and that each of these acquired a separate development, and worked out for itself a separate career; 3d, That upwards of a thousand years before Christ the spirit of conquest appeared among the Semitic nations, dashing them violently against each other; and that at length one Semitic fragment—that is, the Assyrians—attained the supremacy over the rest, and founded a great dominion, called the Assyrian empire, which stretched from Egypt to the borders of India (B. C. 800); and 4th, That the pressure of this Semitic power against the Indo-Persic mass was followed by a reaction—one great section of the Indo-Persians rising into strength, supplanting the Assyrian empire, and founding one of their own, called the Persian empire (B. C. 536), which was destined in its turn to be supplanted by the confederacy of Grecian states in B. C. 326.

Beginning with Egypt, let us trace separately the career of each of the Eastern nations till that point of time at which we find them all embodied in the great Persian empire:—

### The Egyptians.

Egypt, whose position on the map of Africa is well known, is about 500 miles long from its most northern to its most southern point. Through its whole length flows the Nile, a fine large stream rising in the inland kingdom of Abyssinia, and, from certain periodic floods to which it is subject, of great use in irrigating and fertilising the country. A large portion of Egypt consists of an alluvial plain, similar to our meadow grounds, formed by the deposits of the river, and bounded by

ranges of mountains on either side. The greatest breadth of the valley is 150 miles, but generally it is much less, the mountain ranges on either side often being not more than five to ten miles from the river.

A country so favourably situated, and possessing so many advantages, could not but be among the earliest peopled; and accordingly, as far back as the human memory can reach, we find a dense population of a very peculiar character inhabiting the whole valley of the Nile. These ancient Egyptians seem, as we have already said, to have been a mixture of the Semitic with the Ethiopic element, speaking a peculiar language, still surviving in a modified form in the Coptic of modern Egypt. In the ancient authors, however, the Egyptians are always distinguished from the Ethiopians, with whom they kept up so close an intercourse, that it has been made a question whether the Egyptian institutions came from the Ethiopian Meroe, or whether, as is more probable, civilisation was transmitted to Ethiopia from Egypt.

The whole country is naturally divided into three parts—Upper Egypt, bordering on what was anciently Ethiopia; Middle Egypt; and Lower Egypt, including the Delta of the Nile. In each there were numerous cities in which the population was amassed: originally Thebes, a city of Upper Egypt, of the size of which surprising accounts are transmitted to us, and whose ruins still astonish the traveller, was the capital of the country; but latterly, as commerce increased, Memphis in Middle Egypt became the seat of power. After Thebes and Memphis, Ombi, Edfou, Esneh, Elephantina, and Philoe seem to have been the most important of the Egyptian cities.

Our accounts of the Egyptian civilisation are derived chiefly from the Greek historian Herodotus (B. C. 408), who visited Egypt and digested the information which he received from the priests as to its ancient history; and Manetho, a native Egyptian of later times, who wrote in Greek. From their accounts it is inferred that the country was anciently divided into thirty-six sections or provinces called *nomes*—ten in Upper, sixteen in Middle, and ten in Lower Egypt. Many of the separate nomes were of considerable substantive importance, and had a marked local character each to itself, religious as well as political; though the whole of Egypt, from Elephantine to Pelusium and Kanopus, is said to have always constituted one kingdom.\* Of this kingdom, the population, according to a rough estimate, may have been about seven millions. The government was a monarchy based on an all-powerful priesthood, similar to the Brahminical system of India; and, as in India, the most striking feature in the Egyptian society was the division of the people into hereditary castes. 'The population of Egypt,' says Mr Grote in his History of Greece, 'was classified into certain castes or hereditary professions, of which the number is represented differently by different authors. The priests stand clearly marked out as the order richest, most powerful, and most venerated, distributed all over the country, and possessing exclusively the means of reading and writing,\* besides a vast amount of narrative matter treasured up in the memory, the whole stock of medical and physical knowledge then attainable, and those rudiments of geometry (or rather land-measuring) which were so often called into use in a country annually inundated. To each god and to each temple throughout Egypt, lands and other properties belonged, whereby the numerous band of priests attached to him were maintained. Their ascendancy, both direct and indirect, over the minds of the people was immense; they prescribed that minute ritual under which the life of every Egyptian, not excepting the king himself, was passed, and which was for themselves more full of harassing particularities than for any one else. Every day in the year belonged

\* Mr Grote subjoins the following important note:—'The word *priest* conveys to a modern reader an idea very different from that of the Egyptian *isēf*, who were not a profession, but an order, comprising many occupations and professions.'

to some particular god, and the priests alone knew to which. There were different gods in every nome, though Isis and Osiris were common to all; and the priests of each god constituted a society apart, more or less important, according to the comparative celebrity of the temple. The property of each temple included troops of dependents and slaves, who were stamped with "holy marks," and who must have been numerous, in order to suffice for the service of the large buildings and their constant visitors.

Next in importance to the sacerdotal caste were the military caste or order, whose native name indicated that they stood on the left hand of the king, while the priests occupied the right. They were classified into Kalasiries and Hermotybi, who occupied lands in eighteen particular nomes or provinces, principally in Lower Egypt. The Kalasiries had once amounted to 160,000 men, the Hermotybi to 250,000, when at the maximum of their population; but that highest point had long been past in the time of Herodotus. To each man of this soldier-caste was assigned a portion of land, equal to about 6½ English acres, free from any tax. The lands of the priests and the soldiers were regarded as privileged property, and exempt from all burdens; while the remaining soil was considered as the property of the king, who, however, received from it a fixed proportion—one-fifth of the total produce—leaving the rest in the hands of the cultivators. The soldiers were interdicted from every description of art and trade.

The other castes are differently given in different authors; the most probable account, however, is that which assigns them as three—the caste of the husbandmen, that of the artificers, and that of the herdsmen, which last caste included a variety of occupations held in contempt, the lowest and most degraded of all being that of swineherd. The separation between the husbandmen and the herdsmen seems to have arisen from the circumstance that different parts of the country, not suitable for agriculture, were entirely laid out in pasture. The artificers, constituting the vast town population of Egypt, were subdivided into a great variety of occupations, weavers, masons, sculptors, &c. who were compelled to these professions by hereditary obligation. It was by the labour of this vast town population, assisted by that of herds of slaves, that those huge works were accomplished, the remains of which still attest the greatness of ancient Egypt. Part of the artisan population were exclusively occupied in skilled labour; and in a country where there was such a taste for works of masonry, sculpture was necessarily one of the most largely-stocked of the skilled occupations. 'Perfect exactness of execution,' it is said, 'mastery of the hardest stone, and undeviating obedience to certain rules of proportion, are general characteristics of Egyptian sculpture. There are yet seen in their quarries obelisks not severed from the rock, but having three of their sides already adorned with hieroglyphics, so certain were they of cutting off the fourth side with precision.' These skilled artificers may be supposed to have acted as foremen and overseers of the great numbers of labourers who were employed in public works such as the Pyramids. In the construction of these works, no degree of labour for any length of time seems to have intimidated the Egyptians. The huge blocks of stone, sometimes weighing 1000 tons each, were dragged for hundreds of miles on sledges, and their transport, perhaps, did not occupy less time than a year; in one case which is known, 2000 men were employed three years in bringing a single stone from a quarry to the building in which it was to be placed. Usually, the sledges were drawn by men yoked in rows to separate ropes, all pulling at a ring fixed to the block. (See Vol. I. p. 404.) Where it was possible, the blocks were brought from the quarries on flat-bottomed boats on the Nile. But the transport of these masses was much more easily accomplished than the placing of them in elevated situations in the buildings. They were raised by the power of levers and inclined planes at immense trouble and cost. The waste of

human life in these gigantic works must have been enormous. About 120,000 men are said to have perished in the digging of a canal, which was left unfinished, between the Red Sea and an arm of the Nile; and according to Herodotus, the Egyptian priests of his day described the building of the Pyramids as a time of extreme exhaustion and hardship to the whole country.

The religion of the Egyptians seems to have been, in its popular form at least, a mere gross Fetishism, whose principal characteristic was a worship of teeming animal life—the bull, the cat, the ibis, the crocodile, &c.; different animals in different nomes. Whatever profounder meaning lay hid under this gross ceremonial the priest-caste reserved to themselves, as one of the mysteries, the possession of which severed them from the rest of the population. Among these mysteries was the art of writing, which was practised both in the alphabetical and the hieroglyphic form; the latter being used for special purposes. Some vague notion of the immortality of the soul, resembling the Hindoo tenet of transmigration, seems to have pervaded the Egyptian religion; and this belief appears to have lain at the foundation of the Egyptian practice of embalming the dead. The business of embalming was a very dignified one, and was aided by a host of inferior functionaries, who made and painted coffins and other articles which were required. The bodies of the poorer classes were merely dried with salt or natron, and wrapt up in coarse cloths, and deposited in the catacombs. The bodies of the rich and great underwent the most complicated operations, wrapt in bandages dipped in balsam, and laboriously adorned with all kinds of ornaments. Thus prepared, they were placed in highly-decorated cases or coffins, and then consigned to sarcophagi in the catacombs or pyramids. Bodies so prepared have been called mummies, either from the Arabian word *momia*, or the Coptic *mum*, signifying bitumen or gum-resin.

Although the Egyptians carried on from early times a caravan-commerce with the adjacent countries of Phœnicia, Palestine, and Arabia, importing such articles as wine, oil, and spices for embalming, yet exclusiveness and self-sufficiency were characteristics of their civilisation. There, on the banks of the Nile, these millions lived, changeless in their methods through centuries, each individual mechanically pursuing the occupation to which he was born—millions cultivating the soil, and producing wheat, &c. for the subsistence of the whole; others tending the cattle necessary for food or sacrifice; millions, again, crowded into the numerous towns, occupied in the various handicrafts necessary to provide articles of clothing, luxury, &c.—a large proportion of this class being available for stupendous architectural works; and lastly, diffused through these country and town populations, two other proprietor-castes—the one a militia, occupied in gymnastic exercises alone; the other a sacerdotal or intellectual order, within whose body was accumulated all the speculative or scientific wisdom of the country. Relations existed between Egypt and the adjacent countries; and rumours of the nature of its peculiar civilisation may have spread through the nations of the Mediterranean; but for a long while it was shut, like the present China, against foreign intrusion; and it was not till about the year 650 B. C. that it was thrown open to general inspection. In the sixth and fifth centuries B. C., the philosophers of other countries, and especially of Greece, used to visit Egypt in order to acquire, by intercourse with the Egyptian intellectual caste, some of that precious knowledge of which they were believed to be the depositaries.

Although the Egyptian civilisation is known to have existed pretty much as we have described it from immemorial antiquity, yet, with the exception of what we learn from Scripture, we know little of Egyptian history, properly so called, anterior to the time when the country was thrown open to the Greeks. Herodotus and Manetho, indeed, have given us retrospective lists of the Egyptian kings, extending back into the primi-

tive gloom of the world; but portions of these lists are evidently constructed backwards on mythical principles. Thus Manetho, preserving doubtless the traditions of the sacerdotal Egyptian caste, to which he is supposed to have belonged, carries back the imagination as far as 30,000 years before the birth of Christ. From this date till a. c. 5702, great divine personages ruled in Egypt; then (a. c. 5702) it came into the possession of human kings, the first of which was Menes. From the accession of Menes down to the incorporation of Egypt with the Persian empire (a. c. 525), Herodotus assigns 330 kings, or, as they are called in Scripture, Pharaohs, whose names, he informs us, were read to him out of a papyrus manuscript by the Egyptian priests, who pledged themselves to its accuracy; and Manetho reckons up twenty-six dynasties, some of them native and others foreign, which divided the long period into portions of different lengths. The earlier of these dynasties are of course unhistorical, and are to be treated as Egyptian myths—that is, fictions of the peculiar Egyptian imagination, as the Greek stories of Prometheus, &c. were fictions of the peculiar Greek imagination. The later dynasties, however, are not to be thus dismissed. It was in the fifteenth of Manetho's dynasties, or a. c. 1920, that Abraham is supposed to have visited Egypt; and monuments remain which are referred to the sixteenth and seventeenth dynasties, during which it was that the Israelites remained in Egypt. These three dynasties were foreign ones, and are denominated the dynasties of the Hyksos, or shepherd kings—these shepherds being represented as a red-haired and blue-eyed race of invaders, who came from the Semitic countries in the north-east. The shepherd kings are said to have destroyed the monuments of the previous dynasties. At length they were expelled by a native dynasty of Thebans, the eighteenth in Manetho's list, and the head of which is supposed to have been the Pharaoh 'who knew not Joseph.' The exodus of the Israelites from Egypt is believed to have taken place a. c. 1491, under the reign of the Pharaoh of the eighteenth dynasty, named Thothmes III.—the Pharaoh whose heart was hardened, and who was drowned in the Red Sea. This Theban dynasty produced many able sovereigns; one of whom, Ramses II., was a great conqueror, and extended the Egyptian dominion far into Asia. The nineteenth and twentieth dynasties were likewise from Thebes; the twenty-first were Tanites; the twenty-second, Babastites; the twenty-third, Tanites again; the twenty-fourth, Saïtes, from Saïs in Lower Egypt; the twenty-fifth (a. c. 312) was an Ethiopian dynasty, during whose rule there were frequent wars with the Assyrians. The twenty-sixth dynasty, which succeeded the Ethiopian one after a period of anarchy, was from Saïs. The first of its kings was Psammetichus I., whose reign (a. c. 650) constitutes an epoch in Egyptian history. Having attained to the throne by the aid of Greek mercenaries, he broke down the barriers which Egyptian exclusiveness had hitherto kept up against foreigners, greatly to the disgust of many of his subjects, especially of the priestly caste, whose trammels in other respects he threw off, and of the military caste, who found their places occupied by Ionian and Karian colonists. The successors of Psammetichus involved themselves in war with the Chaldeans or Assyrians of Babylon. The fourth of them, named Amasis (a. c. 570-526), rivalled Psammetichus in liberality of policy. 'Besides granting permission,' says Mr Grote, 'to various Grecian towns to erect religious establishments for such of their citizens as visited the Greek port of Naukratis, he also sanctioned the constitution of a formal and organised emporium or factory, invested with commercial privileges, and armed with authority exercised by presiding officers regularly chosen.' To this important establishment was given the name of *the Hellenion*; just as if, at a hitherto close port of China, an institution were to be permitted to be called 'The British Factory.' Under Amasis, Egypt attained to a great degree of prosperity, which was remembered the more that immediately

after his death the country was subjugated by Cambyses, and annexed to the Persian empire (a. c. 525).

Arabia.

The great peninsula of Arabia was in the earliest times inhabited by a population of the Semitic stock, in all essential respects similar to that which inhabits it now, partly concentrated in cities, partly wandering in tribes through the extensive deserts which mark the surface of the country. The inhabitants of the towns subsist by agriculture and commerce; the wandering tribes by cattle-rearing and pillage. In ancient times, as now, the Arabs were celebrated for their expert horsemanship, their hospitality, their eloquence, and their free indomitable spirit. In religion, however, the modern Arabs, who are Mohammedans, differ from the ancient Arabs, who were idolaters, chiefly worshippers of the celestial luminaries, nowhere so beautiful as in the sky of an Arabian desert. The Arabs themselves trace their history back, the older tribes to Kahtan (the Joktan of the 10th chapter of Genesis), the later to Adnan, a descendant of Ishmael the offspring of Abraham. It is unnecessary, however, to enter into this history, as Arabia was not incorporated with the Persian empire, and only assumed historical importance in later times, when it sent forth the religion of Mohammed over the East. (See Nos. 58 and 76.)

Syria.

The Semitic or Aramaic population overspreading Syria—which name is generally applied to the country lying between the Euphrates and Arabian desert on the east, and the Mediterranean on the west—had early divided itself into various independent states or kingdoms, which ultimately resolved themselves, it would appear, into three. These were *Phœnicia*, a narrow strip of coast-land, extending from Mount Carmel to the river Eleutherus; *Palestine*, or the *Holy Land*, including the country south of Phœnicia, between the Arabian desert and the Mediterranean, as well as the inland district lying between Mount Carmel and Mount Herman; and *Syria Proper*, whose capital was Damascus, and which, when the power of the Damascan kings was at its highest, included all the country except Palestine and Phœnicia. Syrian history possesses no independent importance; we pass, therefore, to the history of the Phœnician and Jewish nations.

The Phœnicians.

Phœnicia was an exceedingly small country, its length being only about 120 miles, and its breadth nowhere greater than 20 miles. Indeed it may be described as a mere slip of coast-land, sufficiently large to accommodate a range of port towns, such as a merchant people required. The most northern of these Phœnician cities was Aradus, situated on a small island; the most southern was the famous Tyre; and between the two were situated many others, of which the chief were Sidon, Berytus, Tripolis, and Byblus. The greater part of the population was contained in these cities, the rural population being small in proportion.

Originally, Phœnicia was divided into a number of little states or communities, each having a town for its metropolis, with a hereditary king of its own; and ere the country was restricted by the formation of the Jewish nation, the number of these Phœnician or Canaanitish principalities must have been considerable. The Phœnicians were a fragment of the Canaanites of Scripture; and doubtless in the annals of the separate Phœnician towns, such as Tyre, Sidon, and Aradus, were preserved records, from the Phœnician point of view, of many of those ancient transactions which are related in the Scriptural account of the settlement of the Jews in Canaan. Without going back, however, into the remoter period of Phœnician history, one of the questions connected with which is, whether Tyre (founded, it was said, a. c. 2700) or Sidon was the more ancient town, let us give a summary view of the nature of the Phœnician civilisation at the period of its highest celebrity—namely, from a. c. 1200 to a. c. 700, at which

time we find Tyre exercising a presiding influence over the other Phœnician communities.

The Phœnicians were the great trading nation of antiquity. Situated at so convenient a point on the Mediterranean, it devolved on them to transport to the sea-shore the commodities of the East, brought to them overland by Arabian and Egyptian caravans, and from the sea-shore to distribute them among the expecting nations of the West. Nor were they without valuable products of their own. The sand of their coasts was particularly suitable for the manufacture of glass; their bays abounded in a species of fish which produced a fine purple dye—the celebrated Tyrian purple of antiquity; and in various parts of the country there were excellent mines of iron and copper. It was, in fact, essential for the general interests of the race that the people inhabiting that portion of the Mediterranean coasts should devote themselves to commerce. In anticipation of this, as it might seem, the mountains of Libanus, which separated the narrow Phœnician territory from Syria, were stocked with the best timber, which, transported over the short distance which intervened between these mountains and the sea, abundantly supplied the demands of the Phœnician dock-yards. There was something in the Phœnician character, also, which suited the requirements of their geographical position. Skilful, enterprising, griping in their desire for wealth, and in other respects resembling much their neighbours the Jews, to whom they were allied in race, and whose language was radically identical with their own—theirs was essentially the merchant type of character.

Standing as the Phœnicians did as the people by whom the exchange between the East and the West was managed, a complete view of their life and manner of activity should embrace *first*, their relations with the East—that is, their overland trade with Assyria, Arabia, Egypt, Persia, and India; *secondly*, their relations with the West—that is, their maritime trade with the various nations of the Mediterranean and Atlantic coasts; and *thirdly*, the peculiar character of mind which either accompanied or resulted from the consciousness of such a position in the great family of mankind.

With regard to the overland trade of the Phœnicians with the Eastern countries, little requires to be said except that it was one attended with great risks—the journey of a caravan across the deserts, and through the roaming tribes which separated Phœnicia from interior Asia, being a more serious enterprise than a long sea voyage. It is probable that the Phœnicians managed this commerce not in their own persons, but as wealthy speculative merchants, dealing in a skilful manner with the native Egyptian, Assyrian, or Arabian caravan-proprietors, with whom they maintained an understood connection. At the same time it is likely that they stimulated and regulated the Eastern commerce, by means of Phœnician agents or emissaries despatched into the interior with general instructions, just as in later times European agents were often despatched into the interior of Africa to direct the movements of native merchants. It was in their maritime trade with the West, however, that the Phœnicians chiefly exhibited the resources of their own character. Shipping the Oriental commodities, as well as their native products, at Tyre or Sidon, they carried them to all the coasts of the Mediterranean as far as Spain, selling them there at immense profit, and returning with freights of Western goods. With some of the nations of the Mediterranean their intercourse would be that of one civilised nation with another; with others, and especially with those of the West, it must have been an intercourse similar to that of a British ship with those rude islanders who exchange their valuable products for nails, bits of looking-glass, and other trifles. Whether their customers were civilised or savage, however, the Phœnicians reaped profits from them. Their aim was to monopolise the commerce of the Mediterranean. 'If at any time,' it is

said, 'their ships bound on a voyage observed that a stranger kept them company, or followed them in their track, they were sure to get rid of him, or deceive him if they could; and in this they went so far as to venture the loss of their ships, and even of their lives, so that they could but destroy or disappoint him; so jealous were they of foreigners, and so bent on keeping all to themselves. And to add to the dangers of the sea, and discourage other nations from trading, they practised piracy, or pretended to be at war with such as they met when they thought themselves strongest.' This policy succeeded so far, that hardly a merchant ship was to be seen in the Mediterranean not manned by Phœnicians. From this extension of the Phœnician commerce throughout the Mediterranean resulted, by necessity, an extensive system of colonisation. The distance, for instance, of Spain from Phœnicia, rendered all the greater by the ancient custom of always sailing close by the coast, made it necessary for the Phœnician traders to have intermediate ports, settlements, or factories, to which their vessels might resort, not to say that such settlements were required for the collection of the produce which was to be taken back to Phœnicia. Accordingly, in process of time, Phœnician colonies were established at all available points of the Mediterranean—on the coasts of Africa, Sicily, Sardinia, and Spain, and in the Balearic Islands; the rising maritime spirit of the Greeks excluding the Phœnicians from the *Ægean* and the coasts of Asia Minor. Among the most ancient of the colonies from Tyre were Carthage and Utica on the African coast, and Gades (Cadiz) in Spain; all of which were founded before the first of the Greek Olympiads (b.c. 884). From these afterwards arose smaller settlements, which diffused the Phœnician agency still more extensively among the uncivilised nations of Africa and western Europe. Gades in Spain, situated, according to the ancient mode of navigation, at a distance of seventy-five days' sail from Tyre or Sidon—a distance larger than that which now divides Liverpool from Bombay—was a colony of special importance; first, as commanding the inland Spanish trade, particularly valuable at that time, inasmuch as the gold and silver mines of Spain caused it to be regarded as the Mexico or Peru of the ancient world; and secondly, as forming a point from which the Phœnician commerce could be still farther extended along the extra-Mediterranean shores. From this point, we are told, the Phœnician ships extended their voyages southwards for thirty days' sail along the western coast of Africa, and northwards as far as Britain, where they took in tin from the mines of Cornwall, and even as far as the Baltic, where they collected amber. Upon what a scale of profit must these expeditions have been conducted, when, from Tyre to Cornwall, not a merchant ship besides those of the Phœnicians was to be seen! And who can tell what influence these Phœnician visits may have had on the then rude nations bordering the Atlantic?—or how far these ante-historic Phœnician impulses may have stimulated the subsequent career of these nations? Like the visit of an English merchantman now to a South Sea island, so must have been the visit of a Phœnician trading vessel 3000 years ago to the Britons of Cornwall.

As might be expected, this great merchant people were among the most cultured of antiquity, and especially skilled in all the arts of luxurious living. The 27th chapter of the book of Ezekiel presents a most striking picture of the pride and magnificence of the Tyrians, and embodies many minute particulars relative to Phœnician customs and mode of life. Indeed it has justly been pronounced the most early and most authentic record extant relative to the commerce of the ancients. We shall therefore quote part of it, inserting parenthetical explanations. 'O thou,' says the prophet, 'that art situate at the entry of the sea, which art a merchant of the people for many isles, thus saith the Lord God, O Tyrus, thou hast said, I am of perfect beauty. Thy borders are in the

## HISTORY OF ANCIENT NATIONS.

midst of the seas, thy builders have perfected thy beauty, they have made all thy shipboards of fir-trees of Senir (Mount Hermon); they have taken cedars from Lebanon to make masts for thee. Of the oaks (some translate *alders*) of Bashan have they made thine oars; the company of the Asharites have made thy benches of ivory, brought out of the isles of Chittim (better translated "thy benches"—that is, seats in a pleasure-galley—have they made of ivory inlaid in box from the isles of Chittim—supposed to be Cyprus, Corsica, or Pontus in Asia Minor). Fine linen with brodered work from Egypt was that which thou spreadest forth to be thy sail (some interpret *flag*; but the reference is probably to a pleasure-vessel, whose sails might consist of fine linen); blue and purple from the isles of Elishah (the Grecian countries) was that which covered thee (were used as awnings—Laconian purple being more suitable for this purpose than the more expensive Tyrian). The inhabitants of Zidon (Sidon) and Arvad (Aradus) were thy mariners: thy wise men, O Tyrus, that were in thee, were thy pilots. The ancients of Gebal (another Phœnician city) and the wise men thereof were in thee thy calkers; all the ships of the sea with their mariners were in thee to occupy thy merchandise. (This passage is very minute—Tyre, it seems, supplied its own pilots, but drew its mariners and shipwrights from other parts of Phœnicia.) They of Persia, and of Lud, and of Phut, were in thine army, thy men of war: they hanged the shield and helmet in thee; they set forth thy comeliness (Tyre, it seems, like her daughter Carthage, employed mercenary troops, drawing them chiefly from the nomad tribes of Persia, &c.) . . . Tarshish (here Tarshish means Tarlessus, the Spanish colony of the Phœnicians) was thy merchant (agent) by reason of the multitude of all kind of riches; with silver, iron, tin, and lead, they traded in thy fairs. Javan (the Grecian countries), Tubal, and Meschach (the countries near the Black and Caspian Seas), they were thy merchants; they traded the persons of men (slaves—Circassian and Georgian slaves, valued then as now) and vessels of brass in thy market. They of the house of Togarmah (Armenia) traded in thy fairs with horses, and horsemen, and mules. The men of Dedan (either India or southern Arabia) were thy merchants; many isles were the merchandise of thine hand: they brought thee for a present horns of ivory and ebony (either *tusks of ivory* or *horns, ivory and ebony*). Syria (Coele, Syria, and Mesopotamia) was thy merchant by reason of the multitude of the wares of thy making: they occupied in thy fairs with emeralds, purple, and brodered work, and fine linen, and coral, and agate. Judah, and the land of Israel, they were thy merchants; they traded in thy market wheat of Minnith and Pannag, and honey, and oil, and balm. (The proximity of a corn-growing country like Judea was of great advantage to the Phœnicians—the other products mentioned were also supplied from Judea; the balm from the neighbourhood of Lake Genesareth.) Damascus was thy merchant in the multitude of the wares of thy making, for the multitude of all riches; in the wine of Helbon (Aleppo) and white wool. Dan also and Javan (here part of Arabia is meant), going to and fro, occupied in thy fairs: bright iron, cassia, and calamus, were in thy market. Dedan was thy merchant in precious clothes for chariots. Arabia (the Bedouin Arabs), and all the princes of Kedar, they occupied with thee in lambs, and rams, and goats.

Among the contributions made by the Phœnicians to the west, were alphabetical writing, the Greek alphabet being a derivative from the Phœnician; the scale of weight; and that of coined money. Having made these and other contributions to the west, Phœnicia began about 700 B. C. to decline in importance; the Ionian Greeks, and latterly the Egyptians, becoming its commercial rivals on the Mediterranean; and the invasions of the Assyrians from the east depriving it of independence. Subdued by the Assyrians and Babylonians, Phœnicia was transferred by them to the Per-

sians. Among the last of the Phœnician achievements was the circumnavigation of Africa B. C. 600—a feat undertaken by Phœnician sailors at the command of the Egyptian king Nekos, one of the immediate successors of Psammetik; and, as is now believed, really performed—the course pursued being from the Red Sea round Africa to Spain—the reverse, therefore, of that followed by Vasco de Gama 2000 years later. About the time that Phœnicia began to wane, her colony, Carthage, assumed her place in the affairs of the world. Carthaginian civilisation was essentially a mere repetition of the Phœnician, although under a different form of government: Carthaginian history interweaves itself with that of the Romans. (See No. 57.)

### Palestine—the Jews.

Palestine extends from north to south a length of about 200 miles, and 50 in breadth; and is therefore, in point of size, of nearly the same extent as Scotland. The general character of the country is that of a hilly region, interspersed with moderately fertile vales; and being thus irregular in surface, it possesses a number of brooks or streams, which for the most part are swollen considerably after rains, but are almost dry in the hot seasons of the year. The present condition of Palestine scarcely corresponds with its ancient fertility. This is chiefly attributable to the devastating effects of perpetual wars; and some physical changes have also contributed to the destruction of agricultural industry. Yet, after all, so excellent would the soil appear to be, and so ample its resources, that Canaan may still be characterised as a land flowing with milk and honey.

The history of the extraordinary nation which once inhabited this land, must be so much more familiar to our readers than that of any other ancient nation, that all that is necessary here is a brief sketch, such as will assist the imagination in tracing with due completeness the general career of the East till the establishment of the Persian empire. According to the accounts given of the Jews in Scripture, and in their history by Josephus, they were descended from Abraham, the tenth in descent from Noah, through his second son Shem. According to Josephus, Abraham, who was born in the 292d year (according to other authorities, in the 352d year) after the Deluge, 'left the land of Chaldea when he was seventy-five years old, and, at the command of God, went into Canaan, and therein he dwelt himself, and left it to his posterity. He was a person of great sagacity, both for understanding of all things and persuading his hearers, and not mistaken in his opinions; for which reason he began to have higher notions of virtue than others had, and he determined to renew and to change the opinion all men happened then to have concerning God; for he was the first that ventured to publish this notion, that there was but ONE God, the Creator of the universe; and that as to other gods, if they contributed anything to the happiness of men, that each of them afforded it only according to His appointment, and not by their own power. For which doctrines, when the Chaldeans and other people of Mesopotamia raised a tumult against him, he thought fit to leave that country, and at the command of God he came and lived in the land of Canaan. And when he was there settled, he built an altar, and performed a sacrifice to God.' After the death of Abraham's son Isaac, his younger son Jacob remained for a number of years in Canaan, surrounded by a family of twelve sons, one of whom, Joseph, as related in Scripture, became the cause of the removal of his father and brethren, and all belonging to them, into Egypt. The Hebrew emigrants were seventy in number, and formed at the first a respectable colony among the Egyptians. Jacob died after having been seventeen years in Egypt, and his body was carried by Joseph to Hebron, and buried in the sepulchre of his father and grandfather. Joseph also died in Egypt at the age of 110, and at length his brethren died likewise. Each of the twelve sons of Jacob became the progenitor of a family or tribe, and the twelve tribes, personified by the term

ISRAEL, continued to reside in Egypt, where they increased both in number and in wealth. Their rapid increase and prosperity soon excited the jealousy of the masters of the country; and from being in high favour, the different tribes gradually fell under the lash of power, and came to be treated as public slaves.

The entire body of Israelites, guided by Moses, fled from Egypt in the year 1490 before Christ, at a time when Thebes, Memphis, and the other magnificent cities of that country, were in all their glory. Proceeding in a north-easterly direction from Rameses (near the site of modern Cairo), they went through the level region of the land of Goshen (now a barren sandy plain) to the head of the Gulf of Suez, the western branch of the Red Sea. Here they crossed in a miraculous manner to the opposite shore, to a spot now called the Wells of Moses, where, according to the Scripture narrative, they sang their song of thanksgiving for their deliverance. The country in which they had now arrived was a portion of Arabia Petraea, consisting of a dismal barren wilderness, now called the Desert of Sinai, from the principal mountain which rises within it. From the point at which the Israelites had crossed the Red Sea from Egypt, they were conducted by a most circuitous and tedious route towards the Promised Land of Canaan. Their tiresome journey extended over a period of forty years, and was not completed till all the Hebrews who were above twenty years of age when they left the land of Egypt (excepting Caleb and Joshua) had died, and a new generation, possessing greater courage and confidence in the Almighty, had succeeded them. In the trackless wilderness through which they were led, their multitudes, as we learn from Scripture, could neither have traced their way nor procured subsistence without a continued miracle. The hand of God brought for them streams of water out of the flinty rock; rained manna or bread from heaven; and gave a pillar of cloud to direct their journeys through the day, and a pillar of fire by night. He delivered the tables of a moral law, comprehending the ten commandments, to Moses their leader; and promulgated a set of regulations for the ceremonies of worship, the establishment of a separate order devoted to religion and learning, and for the civil government of the nation. The Hebrews had thus a regular polity and written laws when most other nations knew only the law of the sword, or of savage animal superiority.

The country on the shore of the Mediterranean which was allotted as a settlement to this people, was at that time occupied by many warlike tribes, who had grown strong in its fertile plains and valleys; and the generation of the Hebrews who were conducted into it were compelled to fight for its possession. The struggle was not of long continuance. The whole land was conquered in the year B.C. 1450.

According to the account given in the 26th chapter of the book of Numbers, the Hebrew nation thus brought out of the land of Egypt and settled in Canaan amounted to 601,730 souls, unto whom the land was divided for an inheritance, according to the number of individuals in the respective tribes. The tribes, and their fighting men above twenty years of age, were reckoned as follows:—Tribe of Reuben (the eldest son of Jacob) 43,730; Simeon 22,200; Gad 40,500; Judah 76,500; Issachar 64,300; Zebulun 60,500; Manasseh 52,700; Ephraim 32,500 (the tribes of Manasseh and Ephraim were both from Joseph); Benjamin 45,600; Dan 64,400; Asher 53,400; and Naphtali 45,400. Among these twelve tribes the land was divided. The tribe of Levi (to which belonged Moses, Aaron, and Eleazar the high priest), amounting to 23,000 males from a month old and upwards, received no share of the land: being set apart for the priesthood, the tenth or tithe of the general produce was assigned them as their perpetual inheritance. By making a special agreement with the other tribes that they should assist them against the common enemy, the two tribes of Gad and Reuben, and the half tribe of Manasseh, were permitted to appropriate land

for their inheritance in Gilead and Bashan, on the Arabian side of the Jordan.

Moses dying before the inheritance was entered upon, was succeeded by Joshua as a leader, and by him the Israelites were conducted across the Jordan. The political government of the various tribes, after their conquest and settlement of Canaan, appears to have been republican, with military leaders called Judges; but these acted by the direction of the priesthood, who were immediately counselled by the Deity within the sanctuary. This period of separate government in tribes, called the Period of the Judges, lasted 300 years (B.C. 1427-1112), and was one of daring actions and great deliverances—the heroic age of the Jews.

The epoch of kings succeeded that of judges. The reign of Saul, their first monarch, though the people were stronger by being united, was gloomy and troubled. David, who succeeded, was a soldier and a conqueror. He rendered the Hebrews formidable to the whole of their enemies, and gave them a regular and defensible position, expelling their old antagonists from every part of the country. He left an empire peaceful, respected, and strong; and, what was of as much importance, he selected from among his sons a successor who was able to improve all these advantages, and to add to the progress which his countrymen had already made in prosperity. Under Solomon, the name of the Hebrew government being able to protect its subjects in other countries, the people and their king began to employ themselves in commerce. Their trade was at first engrafted on that of the Phœnicians of Tyre. A greater contrast cannot be imagined than between the troubles of the time of the Judges (only 100 years before), and the peace, security, and enjoyment of this reign. 'And the king made silver to be in Jerusalem as stones, and cedars made he to be as sycamore trees that are in the vale for abundance; and Judah and Israel were many; as the sand which is by the seashore for multitude, eating, and drinking, and making merry.' (1 Kings, x. 27.)

After the death of Solomon, the country fell into the same divisions which had weakened it in the time of the Judges. Each of the districts of North and South Israel was under a separate king, and the people were exposed both to the attacks of their enemies and to quarrels with each other. Their history is a succession of agitating conflicts for independence, and of unexpected and remarkable deliverances, of a similar nature to those of the earlier period, and they continued for about the same length of time (380 years); but they are marked by fewer of those traits of heroic devotion which distinguished the epoch of the Judges. The backslidings, errors, and misgovernment of their kings, is the chief and painful subject which is presented to us; and though these are relieved at times by the appearance of such monarchs as Josiah, Jehoshaphat, and Hezekiah, yet the whole history of this period is overcast with the gloominess of progressive decline. By far the most delightful parts of it are those which relate to the lives of the prophets, who were raised up at intervals to warn the nation and its rulers of the fate which they incurred by forsaking the religion of their fathers. These inspired men sometimes sprang up from among the humblest classes of the community: one from 'the herdsmen of Tekoa,' another from 'ploughing with twelve yoke of oxen;' several were of the priestly order, and one (Isaiah) is said to have been of royal lineage; but the works of all are marked with the same sacredness, force, and authority. They reprehend their countrymen, in the most eloquent strains, at one time for idolatry, and at another for hypocrisy; and their indignation is expressed with the same freedom and dignity against the vices of the highest and the lowest.

Of the two kingdoms into which Palestine had divided itself after the death of Solomon (B.C. 975), the northern, called the Kingdom of Israel, was conquered by the Assyrians of Nineveh (B.C. 722), who carried off many thousands of the people into captivity. Little is known of their fate. By some they are supposed to

have been carried to India, by others to Tartary: 'what became of all the Israelites of the ten tribes,' is still a question with historians. The southern kingdom, called the Kingdom of Judah, retained its independence till B. C. 588, when it was invaded and subdued by Nebuchadnezzar, king of Babylon, who destroyed Jerusalem, and carried away a great number of the principal Jews into captivity at Babylon. On the subversion of the Babylonian dominion by Cyrus, seventy years afterwards, the captives, to the number of 42,360, were permitted to return to their own land, and rebuild Jerusalem. At this period, the whole of Palestine merged in the growing Persian empire.

#### The Assyrians and Babylonians.

That large extent of level country situated between and on the banks of the two great rivers, the Euphrates and the Tigris, was, in the earliest antiquity, the seat of a Semitic population living under an organised government. The origin of the Assyrian state is thus related in Scripture (Genesis, x.)—'And Cush (the son of Ham, the son of Noah) begat Nimrod: he began to be a mighty one in the earth. He was a mighty hunter before the Lord: wherefore it is said, Even as Nimrod the mighty hunter before the Lord. And the beginning of his kingdom was Babel, and Erech, and Accad, and Calneh, in the land of Shinar. Out of that land went forth Asshur (translated in the margin, "Out of that land he—Nimrod—went forth into Assyria"), and builded Nineveh, and the city Rehoboth, and Calah, and Resen between Nineveh and Calah: the same is a great city.' There are two interpretations of this passage, according as the text or the marginal reading is adopted. The one is, that a mighty conqueror of the race of Ham (primitive Ethiopic influence) made an irruption into Mesopotamia, which belonged to the children of Shem, and built there Babylon on the Euphrates, and other cities; becoming, as the Eastern authors say, the first king in the world, and the first man who wore a crown; and that, driven out of their possessions by this conqueror, a part of the children of Shem proceeded farther east, and built Nineveh on the Tigris. The other is, that Nimrod himself, going from Babylon, built Nineveh. In either sense, the passage represents distinctly the early condition of this part of the world—an extensive plain fertilised by the two rivers, the Tigris and the Euphrates; and with great cities scattered over it, gathering the population together at points, if we may so speak, into large solid masses. Of these cities, the most important ultimately were Babylon, built, according to the above account, by Nimrod, B. C. 2217; and Nineveh (called Ninus by the Greeks), built, according to the same authority, either by Asshur or Nimrod about the same time, but afterwards rebuilt and enlarged, according to ancient tradition, by a great king, Ninus, B. C. 1230, down to which period it had been inferior in size to the Resen mentioned in the Scriptural text. With these two cities as capitals, the country divided itself into two corresponding parts or kingdoms—the kingdom of Assyria proper, including, besides part of Mesopotamia, the country to the right of the Tigris as far as Mount Zagros; and the kingdom of Babylonia, including the western part of Mesopotamia, together with the country to the left of the Euphrates as far as Syria proper. The two kingdoms, however, are often included under the joint name of Assyria; a word which, as well as the shorter form Syria, was often employed by the ancient Greek writers to designate the whole region lying along the courses of the two great rivers from the Black Sea to the northern angle of the Persian Gulf.

Although Babylon was, according to Scripture, the earlier of the two powers, yet the Assyrians of Nineveh attained such strength under their hero Ninus, as to reduce the Babylonians to a species of dependence. Under Ninus, and his wife and successor the great conqueress Semiramis, says ancient mythical history, the city of the Tigris extended its dominions

far and wide, from Egypt to the border of India. This empire, known in the common chronologies by the name of 'The Assyrian Empire,' lasted, according to the usual accounts, five or six centuries, during which it was governed, in the absolute Oriental manner, by the successors of Ninus and Semiramis. Of these several are mentioned in Scripture—Phul, the contemporary of Menahem, king of Israel (B. C. 761), and Tiglath Pileser (B. C. 730), both of whom were mixed up with the affairs of Israel and Judah; Salmanassar, contemporary with Hezekiah, king of Judah, and Hosea, king of Israel, by whom it was that Samaria was taken (B. C. 722), and the Israelites led into captivity (B. C. 722); and Sennacherib, or Sanherib (B. C. 714), who attacked Egypt, and whose fruitless invasion of Judah forms the subject of the striking narrative in the 18th and 19th chapters of the second book of Kings. The last of the great line of the Assyrian kings of Nineveh was the luxurious Sardanapalus, in whose reign the empire was dissolved, through the instrumentality of its revolted subjects the Medes (B. C. 626).

After Nineveh, the greatest city in the Assyrian dominion was Babylon. Even while under the dominion of the kings of Nineveh, Babylon appears to have possessed a special organisation under its own chiefs, several of whose names—such as Belesis (B. C. 888), and Nabonassar (A. C. 747)—have been preserved; and, together with the whole province of which it was the capital, to have pursued a special career. The peculiar element in the Babylonian society which distinguished it from that of Assyria proper, was its Chaldean priesthood. 'The Chaldean order of priests,' says Mr Grote, 'appear to have been peculiar to Babylon and other towns in its territory, especially between that city and the Persian Gulf; the vast, rich, and lofty temple of Belus in that city served them at once as a place of worship and an astronomical observatory; and it was the paramount ascendancy of this order which seems to have caused the Babylonian people generally to be spoken of as Chaldeans, though some writers have supposed, without any good proof, a conquest of Assyrian Babylon by barbarians called Chaldeans from the mountains near the Euxine. There were exaggerated statements respecting the antiquity of their astronomical observations,\* which cannot be traced, as of definite and recorded date, higher than the era of Nabonassar (A. C. 747), as well as respecting the extent of their acquired knowledge, so largely blended with astrological fancies and occult influences of the heavenly bodies on human affairs. But however incomplete their knowledge may appear when judged by the standard of after-times, there can be no doubt that, compared with any of their contemporaries of the sixth century B. C.—either Egyptians, Greeks, or Asiatics—they stood pre-eminent, and had much to teach, not only to Thales and Pythagoras, but even to later inquirers, such as Eudoxus and Aristotle. The conception of the revolving celestial sphere, the gnomon, and the division of the day into twelve parts, are affirmed by Herodotus to have been first taught to the Greeks by the Babylonians.' This learned Chaldean class seems to have pervaded the general mass of Babylonian society, as the corresponding priest-caste in Egypt pervaded Egyptian society, with this difference, that Babylonian society does not appear to have been parcelled out like the Egyptian into a rigorous system of castes.

On the dissolution of the Assyrian empire of Nineveh by the Medes (A. C. 626), the Chaldean fragment of it rose to eminence on its ruins, chiefly by the efforts of Nabopolassar, a viceroy of the last Assyrian king. Establishing Babylonia as an independent power in the east, Nabopolassar came into collision with Nekos, king of Egypt, who was at that time extending his empire into Asia. It was in opposing Nekos (Pharaoh-Necho) on his march to Babylon that Josiah, king of

\* When Alexander the Great was in Babylon, the Chaldeans told him their order had begun their astronomical observations 400,000 years before he was born.

Judah, was slain. At length (B.C. 608) Nebuchadnezzar, or Nebuchodonosor, the son of Nabopolassar, defeated Nekos, and annexed all his conquests in Asia to his father's kingdom. Two years afterwards the same prince took Jerusalem, and carried away a number of captives to Babylon, among whom were Daniel and his companions. Succeeding his father, B.C. 605, Nebuchadnezzar reigned over Babylon forty-three years (B.C. 605-561); and during his reign extended the empire to the Mediterranean and the borders of Egypt, adding to it Palestine, Phœnicia, &c. With his countenance the Medes and Lydians destroyed Nineveh (B.C. 601). The great abduction of Jewish captives by his orders took place B.C. 588. He was succeeded (B.C. 561) by his son, Evil-Merodach, who was dethroned (B.C. 559) by his brother-in-law Neriglissar, whose son and successor, Laboroso-archod, was dethroned, after a brief reign, by Nabonnedus, the Belshazzar of Scripture (B.C. 555); in the eighteenth year of whose reign (B.C. 538) Babylon was taken by Cyrus, and passed into the hands of the Persians.

It was during the reign of Nebuchadnezzar that the city of Babylon attained that glory which has rendered it a known word to all who are at all acquainted with history. Herodotus, who saw the city in its decline, gives a description of it which has seemed incredible to many, although now fully verified. 'The city, divided in the middle by the Euphrates, was surrounded with walls in thickness 75 feet, in height 300 feet, and in compass 480 stadia, or about 60 of our miles.' Within this circuit there was included, besides the houses, a space of vacant ground, gardens, pasture, &c. sufficient to accommodate the country population in case of invasion: the height and strength of the walls rendered the city itself to all appearance impregnable. 'These walls formed an exact square, each side of which was 120 stadia, or 15 miles in length; and were built of large bricks cemented together with bitumen, a glutinous slime which issues out of the earth in that country, and in a short time becomes harder than the very brick or stone which it cements. The city was encompassed without the walls by a vast ditch filled with water, and lined with bricks on both sides; and as the earth that was dug out of it served to make the bricks, we may judge of the depth and largeness of the ditch from the height and thickness of the walls. In the whole compass of the walls there were a hundred gates—that is, twenty-five on each side, all made of solid brass. At intervals round the walls were 250 towers. From each of the twenty-five gates there was a straight street extending to the corresponding gate in the opposite wall; the whole number of streets was therefore fifty, crossing each other at right angles, and each fifteen miles long. The breadth of the streets was about 150 feet. By their intersection the city was divided into 676 squares, each about two miles and a quarter in compass, round which were the houses, three or four storeys in height; the vacant spaces within being laid out in gardens,' &c. Within the city the two greatest edifices were the royal palace with its hanging gardens, and the temple of Belus, composed of eight towers built one above another, to the enormous height, it is said, of a furlong.

Without the city were numerous canals, embankments, &c. for the purpose of irrigating the country, which, as little or no rain fell, depended on the river for moisture. 'The execution of such colossal works as those of Babylon and Egypt,' it has been remarked, 'demonstrates habits of regular industry, a concentrated population under one government, and above all, an implicit submission to the regal and kingly sway—contrasted forcibly with the small self-governing communities of Greece and western Europe, where the will of the individual citizen was so much more energetic.' In the latter countries only such public works were attempted as were within the limits of moderate taste. Nineveh is said to have been larger even than Babylon, and is described as an oblong, three days' journey round—that is, upwards of 60 miles.

#### The Medes and Persians.

Extending, as we have said, from the Mediterranean to the Indus, the Assyrian empire had included not only the chief Semitic nations of western Asia, but also that portion of the Indo-Germanic family which was contained between Mount Zagros and the river Indus. Essentially a prolongation of the great race which inhabited Hindoostan, the nature of their country—a vast table-land, here and there rising into hills, or presenting spots of great fertility—had made them quite different in character and habits from the settled and stereotyped Hindoos. All parts of this plateau of Iran, as it was called, including the present countries of Persia, Cabool, and Beloochistan, were not alike; in some portions, where the soil was fertile, there existed a dense agricultural population; in others, the inhabitants were nomadic horse-breeders, cattle-rearers, and shepherds. All the tribes, however, were bound together by the ties of a common Indo-Persic language, quite distinct from that spoken by their Semitic neighbours and masters, and by a common religion. This religion, called the Religion of Zend, a modification probably of some more ancient form, from which Hindooism may also have sprung, was taught by Zerdusht or Zoroaster, a great native reformer and spiritual teacher, who lived six or seven centuries before Christ. The principal doctrine of his religion was that of the existence of two great emanations from the Supreme and perfect Deity—the one a good spirit (Ormuzd), who created man, and fitted him for happiness; the other an evil spirit, named Ahriman, who has marred the beauty of creation by introducing evil into it. Between these two spirits and their adherents there is an incessant struggle for the mastery; but ultimately Ormuzd will conquer, and Ahriman and evil will be banished from the bosom of creation into eternal darkness. The worship annexed to this doctrine was very simple, dispensing with temples or images, and consisting merely of certain solemn rites performed on mountain tops, &c. Fire, and light, and the sun, were worshipped either as symbols or as inferior deities. A caste of priests, called the Magi, answering in some respects to the Brahmins of India or the Chaldeans of Babylon, superintended these ceremonies, and commented on the religion of Zoroaster.

Various of the tribes of Iran, associating themselves together, constituted little nations. Thus adjacent to Assyria, and separated from it by Mount Zagros, was an agglomeration of seven tribes or villages, under the special name of the Medes, the country which they inhabited being thence called Media. South from Media, and nearer the sea, was another district of Iran, called Persis or Persia, inhabited also by an association of tribes calling themselves the Persians. Other nations of Iran were the Parthians, the Bactrians, &c.—all originally subject to the Assyrian empire.

Median history begins with a hero king called Deiokes (B.C. 710-657), who effected some important changes in the constitution of the nation, and founded the Median capital Ekbatana in one of the most pleasant sites in the world. His son, Phraortes (B.C. 657-635), pursued a career of conquest, subjugated Persia and other districts of Iran, and perished in an invasion of Assyria. He was succeeded by his son Cyaxares, who continued his designs of conquest, and extended the Median dominion as far westward into Asia Minor as the river Halys. He was engaged in a repetition of his father's attempt against Nineveh, when he was called away to defend his kingdom against a great roving population, belonging, as is most likely, to the Scythian branch of the Caucasian race (although some reckon them Mongols), who, bursting with their herds of horses and mares from their native seat in Central Asia, had driven the Cimmerians, a kindred race, before them into Asia Minor, and then had poured themselves over the plateau of Iran. Defeating Cyaxares, they kept him from his throne for a period of twenty-eight years, during which they ruled in savage fashion over Media, Persia, &c. At length, having assassinated their chiefs

by a stratagem, Cyaxares regained his dominions, and drove the invaders back into the north. He then renewed his attempt against Nineveh; took it; and reduced the Assyrian empire, with the exception of Babylonia, under his dominion. The Median empire, thus formed, he bequeathed (B.C. 585) to his son Astyages.

Astyages having given his daughter Mandane in marriage to a Persian chieftain named Cambyses, the issue of this marriage was the famous Cyrus, the founder of the Persian monarchy. The circumstances which led to the revolt of the Persians under Cyrus against the Medes, and the dethronement by him of his grandfather Astyages (B.C. 560), had been woven into a romance resembling the story of Romulus, even so early as the age of Herodotus (B.C. 408), so that that accurate historian could not ascertain the particulars. 'The native Persians,' says Mr Grote, 'whom Cyrus conducted were an aggregate of seven agricultural and four nomadic tribes, all of them rude, hardy, and brave, dwelling in a mountainous region, clothed in skins, ignorant of wine or fruit, of any of the commonest luxuries of life, and despising the very idea of purchase or sale. Their tribes were very unequal in point of dignity; first in estimation among them stood the Pasargadae; and the first clan among the Pasargadae were the Achæmenidæ, to whom Cyrus belonged. Whether his relationship to the Median king whom he dethroned was a fact or a politic fiction we cannot well determine, but Xenophon gives us to understand that the conquest of Media by the Persians was reported to him as having been an obstinate and protracted struggle.'

Master of Media, the Persian chief in his turn became a great Oriental conqueror; indeed all the Oriental conquests bear the same character. A nomadic race, led by a chief of great abilities, invades the more organised states, and conquers them; the chief assumes the government, and founds a dynasty, which, after a rule of several generations, becomes enervated, and gives way before some new nomadic incursion. The first power against which Cyrus turned his arms, after having subdued the Medes, was the famous Lydian kingdom, which then subsisted in Asia Minor under the great Croesus. And here, therefore, we must give some account of the ancient condition of Asia Minor and its principalities.

#### States of Asia Minor—The Lydians.

The river Halys divided Asia Minor into two parts. East of the Halys, or near its source, were various nations of the Semitic stock—Cappadocians, Cilicians, Pamphylans, &c.—each organised apart, but all included under the Assyrian, and latterly, as we have seen, under the Median empire. West of the Halys, the inhabitants were apparently of the Indo-Germaic race, although separated by many removes from the Indo-Germans of Persia. Overspreading this part of Asia Minor, as well as Thrace and other parts of south-eastern Europe, this great race had been broken up into fragments distinguished by characteristic differences. To enumerate these various nations, assigning to each its exact geographical limits, is impossible: the chief, however, were the Bithynians, a sort of Asiatic Thracians on the southern coast of the Euxine; the Lydians and Carians in the south-west; and, intermediate between the two, geographically as well as in respect of race and language, the Mysians and Phrygians. These were the native states; but along the whole Ægean shore was diffused a large Greek population, emigrants, it is believed, from European Greece, chiefly gathered into cities. These Greeks of Asia Minor were of three races—the Æolic Greeks in the north, and the Ionian and Dorian Greeks in the south; and perhaps the earliest manifestations of Greek genius, political or literary, were among these Greeks of Asia. The intercourse of these Greeks with the native Lydians, Phrygians, &c. gave rise to mixture of population as well as to interchange of habits; the native music especially of the Lydians and Phrygians became incorporated with that of the Greeks.

When Lydia, with its capital Sardis, first began to be a powerful state, is not known; it is remarkable, however, that the Lydians are not mentioned in Homer. According to Herodotus, the Lydians traced their history back through three dynasties. 1st, The Atyadæ, from the earliest times to B.C. 1221; 2d, The Heraclidæ, from B.C. 1221 to B.C. 716; and 3d, The Mermnadæ. Only the last dynasty is historic; the manner in which it succeeded to that of the Heraclidæ forms the subject of a curious Lydian legend.

The first king of the Mermnad dynasty was Gyges (B.C. 716-678), the second Ardys (B.C. 678-629), in whose reign the Commerians invaded Asia Minor, the third Sadyattes (B.C. 629-617), the fourth Alyattes (B.C. 617-560). Each of these Lydian kings was engaged in wars both with the Asiatic Greeks of the coast and the native states of the interior. The growth of the Lydian power was impeded by the Commerian invasion; but those savage nomades were at length expelled by Alyattes; and Croesus, the son of Alyattes by an Ionian wife, having succeeded his father B.C. 560, soon raised himself to the position of a great potentate, ruling over nearly the whole country westward of the Halys, comprehending Æolian, Ionian, and Dorian Greeks; Phrygians; Mysians, Paphlagonians, Bithynians, Carians, Pamphylans, &c. At Sardis, the capital of this extensive dominion, was accumulated an immense treasure, composed of the tribute which the Lydian monarch derived from the subject states; hence the proverb 'as rich as Croesus.'

Separated from the Median kingdom only by the river Halys, the Lydian dominion naturally became an object of desire to Cyrus after he had acquired the sovereignty of Media. Accordingly (B.C. 546), provoked by an invasion of Croesus, who had received from the Delphic oracle the equivocal assurance, that 'if he attacked the Persians he would subvert a mighty monarchy,' Cyrus crossed the Halys, advanced into Lydia, took Sardis, and made Croesus prisoner. It was intended by the conqueror that the Lydian king should be burnt alive—it is even said that the fire was kindled for the purpose; Cyrus, however, spared his life, and Croesus became his friend and confidential adviser. On the subversion of the Lydian monarchy, its subjects, the Greeks of Asia Minor, were obliged to submit to the conqueror, after having in vain solicited the aid of their brethren the European Greeks. The Lacedæmonians indeed sent an embassy into Asia Minor; and one of their ambassadors had a conference with Cyrus at Sardis, where he warned him 'not to lay hands on any of the Greek towns, for the Lacedæmonians would not permit it.' 'Who are the Lacedæmonians?' said the astonished warrior. Having been informed that the Lacedæmonians were a Greek people, who had a capital called Sparta, where there was a regular market, 'I have never yet,' said he, 'been afraid of this kind of men, who have a set place in the middle of their city where they meet to cheat one another and tell lies. If I live, they shall have troubles of their own to talk about.' To save themselves from the Persians, the Ionian portion of the Asiatic Greeks proposed a universal emigration to the island of Sardinia—a striking design, which, however, was not carried into execution. All Asia Minor ultimately yielded to Cyrus.

#### The Persian Empire.

Having subdued Asia Minor, Cyrus next turned his arms against the Assyrians of Babylon. His siege and capture of Babylon (B.C. 538), when he effected his entrance by diverting the course of the Euphrates, form one of the most romantic incidents in history; an incident connected with Scriptural narrative through its result—the emancipation of the Jews from their captivity. Along with Babylon, its dependencies, Phœnicia and Palestine, came under the Persians.

Cyrus, one of the most remarkable men of the ancient world, having perished in an invasion of Scythia (B.C. 529), was succeeded by his son Cambyses, who annexed Egypt to the Persian empire (B.C. 525), hav-

ing defeated Psammanitus, the son of the Pharaoh Amasis. Foiled in his intention of penetrating Libya and Ethiopia, Cambyses was dethroned by a Magian impostor, who called himself Smerdis, pretending that he was the younger brother of Cambyses, although this brother had been put to death by the order of Cambyses during a fit of madness. A conspiracy of seven great nobles having been formed against the false Smerdis, he was put to death. He was succeeded by one of the conspiring chiefs called Darius Hystaspes, who reigned—over the immense Persian empire, extending from the Nile to the Indus, and beyond it—from B.C. 521 to B.C. 485. 'The reign of Darius,' says Mr Grote, 'was one of organisation, different from that of his predecessor—a difference which the Persians well understood and noted, calling Cyrus "the father," Cambyses "the master," and Darius "the retail trader or huckster." In the mouth of the Persians this last epithet must be construed as no insignificant compliment, since it intimates that he was the first to introduce some methodical order into the imperial administration and finances. Under the two former kings there was no definite amount of tribute levied upon the subject provinces. But Darius probably felt it expedient to relieve the provinces from the burden of undefined exactions. He distributed the whole empire into twenty departments (called Satrapies), imposing upon each a fixed annual tax. This, however, did not prevent each satrap (the Persian governor appointed by the king) in his own province from indefinite requisitions. The satrap was a little king, who acted nearly as he pleased in the internal administration of his province, subject only to the necessity of sending up the imperial tribute to the king at Susa, the capital of the Persian empire; of keeping off foreign enemies; and of furnishing an adequate military contingent for the foreign enterprises of the great king. To every satrap was attached a royal secretary or comptroller of the revenue, who probably managed the imperial finances in the province, and to whom the court of Susa might perhaps look as a watch upon the satrap himself. The satrap or the secretary apportioned the sum payable by the satrapy in the aggregate among the various component districts, towns, or provinces, leaving to the local authorities in each of these latter the task of assessing it upon individual inhabitants. From necessity, therefore, as well as from indolence of temper and political incompetence, the Persians were compelled to respect the authorities which they found standing both in town and country, and to leave in their hands a large measure of genuine influence. Often even the petty kings who had governed separate districts during their state of independence, prior to the Persian conquest, retained their title and dignity as tributaries to the court of Susa. The empire of the great king was thus an aggregate of heterogeneous elements, connected together by no tie except that of common fear and subjection—noway coherent nor self-supporting, nor pervaded by any common system or spirit of nationality.'

#### Continuation through Greek and Roman History.

How Darius, in consequence of the assistance rendered by the Athenians to the Ionian Greeks of Asia Minor, who had revolted against him (B.C. 502), sent a vast Persian army into European Greece; how this army was defeated by the Athenian general, Miltiades, with only 11,000 men, in the glorious battle of Marathon (B.C. 490); how, ten years later, Xerxes, the son and successor of Darius, undertook an expedition against Greece with a host of several millions, and was defeated by Themistocles in a naval battle at Salamis (B.C. 480), which was followed by two contemporaneous defeats of his lieutenants at Plataea and Mycalé (B.C. 479); how the Persians were thus finally driven back into Asia; how for a century and a-half relations, sometimes hostile and sometimes friendly, were maintained between the Greek states and the Persian monarchs, the degenerate successors of Darius and Xerxes, under

whom the empire had begun to crumble; how at length, in the reign of Darius Codomannus (B.C. 334), Alexander the Great retaliated on the Persians the wrongs they had done the Greeks by invading and destroying their decrepit empire, and organising all the countries between the Adriatic and the Indus under, not a Semitic, as in the case of the Assyrian empire, nor an Indo-Germanic, as in the case of the Perac empire, but a Greek or Pelasgic system; how, on Alexander's death (B.C. 323), this vast agglomeration of the human species fell asunder into three Greek monarchies—the Macedonian monarchy, including the states of European Greece; the Egyptian monarchy of the Ptolemies, including, besides Egypt, Phœnicia, Palestine, and Arabia; and the Syrian monarchy of the Seleucids, comprehending, although with a weak grasp, Asia Minor (or at least parts of it which had belonged to the Lydian and Assyrian empires), Syria, Assyria, and Babylonia; with the loss, however, of the countries between the Tigris and the Indus, where a germ of independence arose (B.C. 236) in a native nomad dynasty, which ultimately united all the tribes of Iran in one empire, called the Parthian Empire; and how these three fragments dragged on a separate existence, full of wars and revolts: all this belongs to Grecian history—that is, to the history of the Hellenic portion of the Pelasgians, whose career is fully detailed in the following number.

How, about two centuries and a-half before Christ, another, but more mixed portion of this Pelasgic family, which had arisen in Italy, and in the course of several centuries rendered itself co-extensive with that peninsula—began to assume consequence in the wider area of the Mediterranean world: how it first grappled with the power of the Carthaginians (B.C. 264–201), who for several centuries had been pursuing the career of world-merchants, formerly pursued by their fathers the Phœnicians; how it then assailed and subdued the crumbling Macedonian monarchy, incorporating all Greece with itself (B.C. 134); how, retrograding, so to speak, into Asia, it gradually ate up the Syrian and Egyptian monarchies, till it came into collision with the Parthian empire at the Euphrates (B.C. 134—B.C. 60); how, advancing into the new regions of northern and western Europe, it compelled the yet uncultured races there—the Celts or Gauls, the Iberians, &c.—to enter the pale of civilisation (B.C. 80–50); how, thus, from the Atlantic to the Euphrates, was founded a new empire, called 'The Roman,' retaining, with vast additions, all that portion of humanity which the former empires had embraced, with the exception of what had lapsed back to the Parthians; how this empire subsisted for several centuries, a great mass of matured humanity girt by comparative barbarism—that is, surrounded on the east by the Parthians, on the south by the Ethiopians, on the north by the Germans and Scythians, and on the west by the roar of the Atlantic; and how at last (A.D. 400–475) this great mass, having lost its vitality, fell asunder before the irruption of the barbaric element—that is, the Germans, the Scythians, and the Arabs—giving rise to the infant condition of the modern world: all this belongs to Roman history, which forms the subject of a separate treatise.

With one general remark we shall conclude; namely, that the progress of history—that is, of the Caucasian development—has evidently been, upon the whole, from the east westward. First, as we have seen, the Assyrian or Semitic fermentation affected western Asia as far as the Mediterranean; then the Persian movement extended the historic stage to the Ægean; after that the Macedonian conquest extended it to the Adriatic; and finally, the Romans extended it to the Atlantic. For fifteen centuries humanity kept dashing itself against this barrier; till at length, like a great missionary sent in search, the spirit of Columbus shot across the Atlantic. And now, in the form of a dominant Anglie race, though with large intermixture, Caucasian vitality is working in its newest method, with Ethiopian help, on the broad and fertile field of America.

# HISTORY OF GREECE.

GREECE is a peninsula situated on the northern shore of the Mediterranean, between the Ionian and Ægean Seas. As a country, it is beautifully diversified by hills and valleys, like Wales or the Highlands of Scotland. Some of the hills are so high as to be constantly covered with snow; while the low districts enjoy a mild climate, and are of extreme fertility—several of them, as Tempe and Arcadia, being spoken of with rapture by the poets of ancient times. As the country is much divided by hills and indentations of the sea, it was partitioned, from an early period, into a number of petty states, which were under separate governments, and often at war with each other. The southern part of the peninsula, anciently styled the Peloponnesus, and now the Morea, was divided into Laconia (containing Sparta), Argolis, Achaia, Arcadia, Elis, and Messenia, each of which was only about the size of a moderate English county. Middle Greece (now Livadia), to the north of the Peloponnesus, and connected with it by the Isthmus of Corinth, on which lay the city of that name, contained Attica (in which was the city of Athens), Megaris, Bœotia (in which was the city of Thebes), Phocis, Locris, Doris, Ætolia, and Acarnania. Northern Greece contained Thessaly (now the district of Jannina), Epirus (now Albania), and Macedonia (now Filiba Vilajeti), the last of which did not, however, belong to Greece till a comparatively late period.

To the east of Greece proper lay the numerous islands of the Ægean Sea, otherwise denominated the Archipelago; with which may be included certain islands lying in the Mediterranean Sea in the same direction, the principal of which were Rhodes, Cyprus, and the Cyclades. To the south lay Cythera (now Cerigo) and Crete (now Candia). To the west, in the Ionian Sea, lay Corcyra (Corfu), Cephalonia, Ithaca, and others, now constituting the distinct confederacy of the Ionian Islands, under protection of Great Britain.

Besides having possession of these various districts on the mainland, and islands on both sides of the peninsula, the Greeks in the course of time acquired colonies in Sicily and Southern Italy, as well as on the coast of Asia Minor, adjacent to the islands in the Ægean Sea. The principal of these Asiatic possessions was Ionia, a beautiful and fertile country, the capital of which was Ephesus.

In consequence of Greece having been divided into a number of petty states, each of which maintained its own political independence, the history of the country necessarily assumes the character of a number of separate narratives. The Greeks, in the different states, did not consider themselves as constituting a single nation or people, although they were in some measure united by similarity of origin, language, religion, and manners. It was not, indeed, till a comparatively late period that they had any name for the entire country; the name then assumed was *Hellas*. The term *Grecia* (Greece) was conferred by the Romans, and has since been generally employed.

## EARLY HISTORY AND MYTHOLOGY.

The history of the Grecian states commences about 1800 years before Christ, when the Egyptians on the opposite side of the Mediterranean were in a high state of civilisation; but the portion of history which precedes 884 B.C. is understood to be fabulous, and entitled to little credit. According to the Greek poets, the original inhabitants of the country, denominated Pelasgians, were a race of savages, who lived in caves, and clothed themselves with the skins of wild beasts. Uranus, an Egyptian prince, landed in the country, and became the father of a family of giants, named Titans, who rebelled against, and dethroned him. His son Saturn, who reigned in his stead, in order to prevent the like misfortune from befalling himself, ordered all his own children to be put to death as soon as they were born. But one named Jupiter was concealed by the mother, and reared in the island of Crete, from which in time he returned, and deposed his father. The Titans, jealous of this new prince, rebelled against him, but were vanquished and expelled for ever from the country.

Jupiter divided his dominions with his brothers Neptune and Pluto. The countries which he reserved to himself he governed with great wisdom, holding his court on Mount Olympus, a hill in Thessaly, 9000 feet in height, and the loftiest in Greece. Any truth which there might be in the story of the Titans and their princes was completely disguised by the poets, and by the popular imagination. Saturn, Jupiter, Neptune, and Pluto, were looked back to, not as mortals, but as deities; and the top of Mount Olympus was supposed to be the heavenly residence of the gods, by whom the affairs of mortals were governed. And for ages after the dawn of philosophy, these deified sons of Saturn, and numberless others connected with them, were the objects of the national worship, not only among the Greeks, but also among the Romans.

At an uncertain but very early date an Asiatic people named the Hellenes immigrated into Greece, in some cases expelling the Pelagi, and in others intermingling with them, so that in process of time all the inhabitants of Greece came to be called Hellenes. They were, however, divided into several tribes, the principal of which were the Dorians, Æolians, and Ionians, each of whom spoke a dialect differing in some respects from those made use of by the others. These dialects were named the Doric, Æolic, and Ionic, in reference to the tribes which used them; and a fourth, which was afterwards formed from the Ionic, was named the Attic, from its being spoken by the inhabitants of Attica.

In the year 1856 B.C., Inachus, a Phœnician adventurer, is said to have arrived in Greece at the head of a small band of his countrymen. Phœnicia, a petty state on the coast of the Mediterranean, in Asia Minor, was at this time one of a few countries, including Egypt and Assyria, in which some degree of civilisation pre-

vailed, while all the rest of the people of the earth remained in their original barbarism, like the Pelasgians before the supposed arrival of Uranus. Navigation for the purposes of commerce, and the art of writing, are said to have originated with the Phœnicians. On their arrival in Greece, Inachus and his friends founded the city of Argos, at the head of what is now called the Gulf of Napoli, in the Peloponnesus.

Three hundred years after this event (1556 B.C.), a colony, led by an Egyptian named Cecrops, arrived in Attica, and founded the celebrated city of Athens, fortifying a high rock which rose precipitously above the site afterwards occupied by the town.

Egypt is situated in the north-eastern part of Africa. It is bounded on the north by the Mediterranean Sea, and is watered by the great river Nile, the periodical overflows of which, by supplying the moisture necessary for vegetation, render the soil very fertile. From this country, which had at a very early period made considerable advances in some of the arts and sciences (see ANCIENT HISTORY), Cecrops imported much valuable knowledge to the rude inhabitants of Attica, whom he had persuaded or obliged to acknowledge him as their chief or king. He placed his rocky fastness under the protection of an Egyptian goddess, from whose Greek name, *Athena* (afterwards changed by the Latins into *Minerva*), the city which subsequently rose around the eminence was called Athens.

About the year 1493 B.C., Cadmus, a Phœnician, founded the city of Thebes in Bœotia; and among other useful things which he communicated to the Greeks, he is said to have taught them alphabetical writing, although it is certain that that art did not come into common use in Greece until several centuries after this period.

The city of Corinth, situated on the narrow isthmus which connects the Peloponnesus with the mainland of Greece, was founded in the year 1520 B.C., and from its very advantageous position on the arm of the sea to which it anciently gave a name, but which is now known as the Gulf of Lepanto, it very soon became a place of considerable commercial importance. Sparta or Lacedæmon, the celebrated capital of Laconia in the Peloponnesus, is said to have been founded about 1520 B.C. by Lelex, an Egyptian.

In the year 1485 B.C., an Egyptian named Danaus, accompanied by a party of his countrymen, arrived at Argos, the inhabitants of which must have been at that period in an exceedingly rude state, since it is said that he excited their gratitude so much by teaching them to dig wells, when the streams from which they were supplied with water were dried up with the heat, that they elected him as their king.

Fully more than a century after this period (about 1350 B.C.), Pelops, the son of a king of Phrygia, a country in Asia Minor, settled in that part of Greece which was afterwards called from him Peloponnesus, or the island of Pelops, where he married the daughter of one of the native princes, whom he afterwards succeeded on the throne. In the course of his long reign, he found means to strengthen and greatly extend his influence in Greece, by forming matrimonial alliances between various branches of his own house and the other royal families of the Peloponnesus. Agamemnon, king of Mycænæ, in Argolis, who was, according to the poet Homer, the commander-in-chief of the Greeks at the siege of Troy, and Menelæus, king of Sparta, on account of whose wrongs that war was undertaken, were descended from this Phrygian adventurer.

Hercules, a Theban prince, was another of the descendants of Pelops. The numerous and extraordinary feats of strength and valour of Hercules excited the admiration of his contemporaries, and being afterwards exaggerated and embellished by the poets, caused him at length to be regarded as a person endowed with supernatural powers, and even to be worshipped as a god.

According to the poets, Hercules was the son of the god Jupiter, and of Alcmena, daughter of Electryon, king of Mycænæ. Before his birth, his mother married

Amphitryon, king of Thebes, by whom the infant Hercules was adopted as his son. While yet a child in the cradle, he is fabled to have crushed to death two snakes which the goddess Juno had sent to destroy him. After he grew up, he performed many heroic and extraordinary actions, commonly called his 'labours.' Among these was his killing a dreadful lion, by clasping his arms round its neck, and so choking it.

Another of the fabled labours of Hercules was his destroying the Hydra of Lerna. This was a monstrous seven-headed serpent, which haunted the small lake of Lerna, now Molini, in Argolis, and filled with terror the inhabitants of the whole of that part of the country. Hercules dauntlessly attacked it, and struck off several of its heads with his club. But these wonderful heads were no sooner beaten off than they grew on again, so that it seemed an impossibility to kill a monster whose injuries were so quickly repaired. At last, one of the companions of Hercules having, at the hero's request, seared with a hot iron the necks of the hydra as fast as each decapitation was accomplished, it was discovered that the heads did not spring again, and Hercules was thus enabled to complete the destruction of this terrible reptile.

Another achievement of this hero, to which allusion is often made by modern writers, was the cleansing of the stables of Augéus, king of Elis, in which three hundred cattle had been kept for thirty years, without any attempt having been made during all that time to remove the accumulating filth. This much-required purification the hero accomplished by turning into the stables a river which flowed in the vicinity. Hercules also undertook an expedition for the purpose of carrying off the cattle of Geryon, king of Gades, now Cadiz, in Spain. Geryon is represented as having been a monster with three heads, and a proportionate supply of arms and legs, and to have ruled over the greater part of Spain with the utmost cruelty. He was killed by Hercules, who brought away his valuable flocks in triumph. In this expedition he is said to have formed the Strait of Gibraltar, in order to open a communication between the Mediterranean and Atlantic, by rending asunder Spain and Africa, which had until then been united. Two mountains, Calpe and Abyla (one on each side of the Strait), raised by him in the execution of this task, were called the Pillars of Hercules, and the appellation is not unfrequently made use of by authors even at the present day.

After many adventures in foreign countries, he returned to the Peloponnesus, where he took to wife a lady named Dejanira. For a while they lived happily together; but at last, believing that Hercules had become less attached to her than formerly, his consort presented him with a tunic steeped in a mixture, which she expected to operate as a charm in regaining for her his affections, but which was, in reality, a deadly poison, artfully placed in her hands by an enemy. As soon as Hercules had put on this fatal garment, he was attacked with the most excruciating pain, and being anxious to put a period as speedily as possible to his agonies, he stretched himself upon a funeral pile, and causing a friend to set it on fire, was burned to ashes. His spirit is said to have ascended to heaven in a chariot drawn by four horses, which Jupiter, the king of the gods, transmitted to earth for the purpose, and Juno, the celestial queen, gave him her daughter Hebe as his wife. Dejanira, on learning the unfortunate result of her attempt to recover her husband's love, put an end to her own life in despair.

Such are the wild fictions which have been handed down respecting Hercules, who was in reality nothing more than a Greek prince of great valour and bodily strength. Having been expelled from Mycænæ by a rival claimant of the throne of that state, he appears to have spent the greater part of his life in wandering over Greece at the head of a band of military followers, sometimes attacking and destroying the robber chiefs and petty tyrants who at that rude and unsettled period abounded in all parts of the country, and on other

## HISTORY OF GREECE.

occasions engaging in predatory expeditions himself. His character bears no slight resemblance to that of the military chieftains who flourished in our own country a few hundred years ago, and who, with somewhat confused notions of right and wrong, were equally ready to succour the weak against a powerful oppressor, and to attack and plunder an enemy, or even, in many cases, an offending neighbour, whose numerous flocks offered a tempting booty.

During the lifetime of Hercules (1263 a.c.), Jason, a prince of Thessaly, made a voyage to Colchis, a country on the eastern side of the Euxine or Black Sea. His enterprise was afterwards greatly celebrated under the name of the Argonautic Expedition, from Argo, the vessel in which he sailed. This ship is generally referred to by the ancients as the first that ever ventured on a long voyage. It is uncertain what was the real object of the Argonautic expedition, although it seems probable that, as Colchis was rich in mines of gold and silver, Jason and his companions, among whom were Hercules and several other persons of distinction, were actuated by a desire to rob the country of some of its valuable metals. The poets, however, tell us a different story. Phryxus and Hellé, the son and daughter of Athamus, king of Thebes, being compelled, according to the poetical account, to quit their native country to avoid the cruelty of their stepmother, mounted on the back of a winged ram with a fleece of gold, and were carried by this wonderful animal through the air towards Colchis, where an uncle of theirs, named Æetes, was king. Unfortunately, as they were passing over the strait now called the Dardanelles, which connects the Ægean Sea with the Propontis, or Sea of Marmora, Helle became giddy, and falling into the water, was drowned. From her, says the legend, the strait was named the Hellespont, or Sea of Helle.

When Phryxus arrived in Colchis, he sacrificed his winged ram to Jupiter, in acknowledgment of divine protection, and deposited its golden fleece in the same deity's temple. He then married the daughter of Æetes, but was afterwards murdered by that king, who wished to obtain possession of the golden fleece. To avenge Phryxus's death, Jason, who was his relation, undertook the expedition to Colchis, where, after performing several marvellous exploits, he not only obtained the golden fleece, but persuaded Medea, another daughter of King Æetes, to become his wife, and to accompany him back to Greece.

One of the persons associated with Jason in the Argonautic expedition was Theseus, a hero almost as celebrated as Hercules himself. His father, Ægeus, was king of Athens, and his mother, Æthra, was the daughter of Pittheus, king of Troezen, in Argolis. An insurrection which broke out in Attica obliged Ægeus to leave Æthra at her father's court, before Theseus was born, and to repair in haste to Athens. Before his departure, he conducted his wife to a lonely spot in the vicinity of Troezen, where there stood a large rock with a cavity in the centre. In this hollow he placed a pair of sandals and a hunting-knife, and after covering them over with a piece of marble of great weight, he addressed Æthra in the following words:—'If our child shall prove a boy, let his removal of this stone be one day the proof of his strength; when he can do this, inform him of his parentage, and send him with the tokens it covers to me in Athens.'

When Theseus had arrived at manhood, his mother, remembering the words of Ægeus, took him to the rock where the tokens were deposited, and desired him to try to lift off the mass of marble which his father had placed above them. Being a youth of uncommon strength, he accomplished this with ease, upon which Æthra communicated to him the rank of his father, and giving him the sandals and the hunting-knife, charged him to bear them to Ægeus at Athens.

Troezen, where the young prince of Athens was nurtured, lay on the western shore of the gulf which separates the Peloponnesus from Attica. As the journey to Athens by land was both circuitous and dangerous,

Theseus was advised to cross to Attica by water. But his lofty spirit could not brook the idea of shrinking from danger, and he resolved to proceed to his destination overland. Hercules had before this time destroyed many of the robber chiefs who infested Greece, but notwithstanding all his exertions, there were numbers still remaining; and as Theseus proceeded along the coasts of the Saronic gulf, he encountered and discomfited not a few of these marauders. Among others, he is said to have destroyed a cruel chieftain named Procrustes, who had a bed on which he stretched his captives, shortening or lengthening their bodies to correspond with the size of the bed, by either barbarously cutting off a portion of their limbs, or racking them out, as the case might be. After many toils and perils, Theseus arrived safe in Athens; and Ægeus, recognising him by the tokens he brought, presented him to the people as the heir to the throne.

The fame of his warlike exploits rendered Theseus a favourite with the Athenians; and soon after his arrival among them, he took a step which greatly added to his popularity. In consequence of their want of success in a war with Minos, a celebrated king of Crete, the Athenians had been obliged to send to that sovereign an annual tribute of seven young men and as many young girls. These victims, it is probable, were, on their arrival in Crete, condemned to slavery; but the popular belief of those superstitious times was, that they were thrown into a labyrinth constructed by an ingenious person named Dædalus, where they were devoured alive by a monster called a Minotaur (*taurus*, a bull), one-half of whose body resembled a man, and the other a bull.

When the time came round for selecting by lot the annual victims, Theseus, observing the horror of those on whom the lot fell, and the deep sympathy which was universally felt for their unhappy fate, resolved to make a bold effort to obtain the abrogation of the cruel tribute. For that purpose he voluntarily enrolled himself as one of the victims, and was sent to Crete along with the others. On his arrival there, he was well received by Minos, who had already heard of his heroic deeds, and who admired the warmth of that patriotism which had led the Athenian prince thus to offer himself up a voluntary sacrifice for the benefit of his country.

On further acquaintance, Minos conceived so high an opinion of Theseus, that he gave him his daughter Ariadne in marriage, and relinquished his claim to the humiliating tribute which he had hitherto exacted from the Athenians. Theseus then returned to Athens, where he was received with every demonstration of public respect. Annual sacrifices and festivals were instituted in commemoration of his patriotic conduct, and the vessel in which he had made his voyage to Crete was carefully preserved for many centuries, being from time to time repaired, until at last it became a question, which was gravely discussed by the learned, whether it was or was not to be still regarded as the vessel of Theseus, after its several parts had been so frequently renewed.

Theseus succeeded his father on the Athenian throne (1234 a.c.), and by his wise regulations greatly consolidated the strength and increased the prosperity of his kingdom. Cecrops, the founder of Athens, had divided Attica into twelve districts, each of which possessed its own magistracy and judicial tribunals. As the country advanced in wealth and population, these districts became less closely connected with each other, and at the period of the accession of Theseus, they could hardly be regarded in any other light than as so many little independent communities, whose perpetual disputes kept the whole district in broils and confusion. But Theseus had influence enough with all parties to obtain their consent to the abolition of the separate jurisdictions, and to the fixing of all civil and judicial authority in the capital. He at the same time voluntarily resigned into their hands a portion of his own power. Having divided the people into three classes—the nobles,

the artisans, and the cultivators of the soil—he intrusted the first of these with the administration of public affairs, and the dispensation of justice, while he conferred upon every freeman or citizen, without distinction of class, a vote in the legislative assemblies. The command of the army, and the presidency of the state, he retained in his own person.

To strengthen the political union of the various districts of his kingdom by the tie of a common religion, he instituted a solemn festival, to be celebrated annually at Athens by all the inhabitants of Attica, in honour of Minerva, the tutelary deity of the city. This festival he denominated Panathenæa, or the Feast of all the Athenians, the name by which the whole of the people of Attica were thenceforth called.

The wise and liberal policy of Theseus caused Attica to advance considerably beyond the other states of Greece in prosperity and civilisation; and the ancient historian, Thucydides, informs us that the Athenians were the first of the Greeks who laid aside the military dress and arms, which till now had been constantly worn. The example of Athens was not lost on the other Grecian communities, all of which gradually adopted, to a greater or less extent, those political institutions which had conferred so many advantages upon Attica.

Notwithstanding the judicious and exemplary conduct of Theseus in the early part of his reign, he appears to have afterwards allowed his restless and adventurous disposition to hurry him into many extravagances, and even crimes, by which he forfeited the respect of his people, and brought disgrace and suffering on his latter years. If we may believe the traditional accounts, he accompanied Hercules in some of his celebrated expeditions, and assisted by Pirithoüs, a king of Thessaly, engaged in many martial and predatory adventures, conformably rather with the very imperfect morality and rude manners of the age, than with his own previous character. There reigned in Lacedæmon at this period a king named Tyndarus, who had a beautiful daughter called Helen, and according to the ancient historians, Theseus and his friend Pirithoüs formed the design of stealing away this young lady, and a princess of Epirus named Proserpine. They succeeded in carrying off Helen; but in their attempt to obtain Proserpine, they fell into the hands of her father, by whom Pirithoüs was put to death, and Theseus thrown into prison. Meanwhile, Castor and Pollux, the twin-brothers of Helen, who were afterwards deified, and whose names have been bestowed upon one of the signs of the Zodiac (Gemini), rescued their sister from the men to whom Theseus had given her in charge, and ravaged Attica in revenge for the injury they had received from his king.

Theseus was afterwards released from imprisonment by the assistance of Hercules, and returned home; but the Athenians had become so offended with his conduct, and were so angry at his having exposed them to ill-treatment from the Lacedæmonians by his wicked attempt upon Helen, that they refused to receive him again as their sovereign. He therefore withdrew into exile, and soon after died in the island of Scyros. The Athenian people, however, never forgot the benefits he had in his wiser days conferred upon the state; and many centuries after his death, his bones, or some which were supposed to be his, were conveyed to Athens with great pomp, and a splendid temple was erected above them to his memory.

The Lacedæmonian princess who was stolen away by Theseus afterwards became the occasion of a celebrated war. The fame of her great beauty having spread far and wide, many of the princes of Greece asked her from her father Tyndarus in marriage; but he, being fearful of incurring the enmity of the rejected suitors, declined showing a preference for any of them. Assembling them all, he bound them by an oath to acquiesce in the selection which Helen herself should make, and to protect her against any attempts which might afterwards be made to carry her off from the husband of her choice. Helen gave the preference to Menelaus, a grandson of

Pelops, and this successful suitor, on the death of Tyndarus, was raised to the Spartan throne.

At this period, in the north-western part of Asia Minor, on the shores of the Hellespont and the Ægean Seas, there existed a kingdom, the capital of which was a large and well-fortified city named Troy, or Ilium. Priam, the king of Troy, had a son whose name was Paris; and this young chief, in the course of a visit to Greece, resided for a time in Sparta at the court of Menelaus, who gave the Asiatic stranger a very friendly reception. Charmed with Helen's beauty, Paris employed the opportunity afforded by a temporary absence of her husband to gain her affections, and persuade her to elope with him to Troy. It was not, according to the old poets, to his personal attractions, great as they were, that Paris owed his success on this occasion, but to the aid of the goddess of Love, whose favour he had won by assigning to her the palm of beauty, on an occasion when it was contested between her and two other female deities.

When Menelaus returned home, he was naturally wroth at finding his hospitality so ill requited; and after having in vain endeavoured, both by remonstrances and threats, to induce the Trojans to send him back his queen, he applied to the princes who had formerly been Helen's lovers, and called upon them to aid him, according to their oaths, in recovering her from her seducer. They obeyed the summons; and all Greece being indignant at the insult offered to Menelaus, a general muster of the forces of the various states took place at Aulis, a seaport town of Bœotia, preparatory to their crossing the Ægean to the Trojan shore. This is supposed to have happened in the year 1194 B. C.

Of the chiefs assembled on this occasion, the most celebrated were Agamemnon, king of Mycenæ; Menelaus, king of Sparta; Ulysses, king of Ithacæ; Nestor, king of Pylos; Achilles, son of the king of Thessaly; Ajax, of Salamis; Diomedes, of Ætolia; and Idomeneus, of Crete. Agamemnon, the brother of the injured Menelaus, was elected commander-in-chief of the confederated Greeks. According to some ancient authors, this general was barbarous enough to sacrifice his daughter Iphigenia, to induce the gods to send a favouring gale to the Grecian fleet when it was detained by contrary winds in the port of Aulis; but as the earliest writers respecting the Trojan war make no mention of this unnatural act, it is to be hoped that it never was performed.

The Grecian armament consisted of about 1200 vessels, with from 50 to 120 men in each, and the army which warred against Troy is supposed to have amounted altogether to about 100,000 men. The Trojans, although reinforced by auxiliary bands from Assyria, Thrace, and Asia Minor, were unable to withstand the Greeks in the open country, and they therefore soon retired within the walls of their city.

In those early times men were unskilled in the art of reducing fortified places, and the Greeks knew of no speedier way of taking Troy than blockading it till the inhabitants should be compelled by famine to surrender. But here a new difficulty arose. No arrangements had been made for supplying the invaders with provisions during a lengthened siege; and after they had plundered and laid waste the surrounding country, they began to be in as great danger of starvation as the besieged. The supplies which arrived from Greece were scanty and irregular, and it became necessary to detach a part of the beleaguering forces to cultivate the plains of the Chersonesus of Thrace, in order to raise crops for the support of themselves and their brethren in arms.

The Grecian army being thus weakened, the Trojans were encouraged to make frequent sallies, in which they were led generally by the valiant Hector, Priam's eldest and noblest son. Many skirmishes took place, and innumerable deeds of individual heroism were performed, all of which led to no important result, for the opposing armies were so equally matched, that neither

## HISTORY OF GREECE.

could obtain any decisive advantage over the other. At length, after a siege of no less than ten years, in the course of which some of the most distinguished leaders on both sides were slain, Troy was taken, its inhabitants slaughtered, and its edifices burnt and razed to the ground.

According to the poets, it was by a stratagem that this famous city was at last overcome. They tell us that the Greeks constructed a wooden horse of prodigious size, in the body of which they concealed a number of armed men, and then retired towards the sea-shore, to induce the enemy to believe that the besiegers had given up the enterprise, and were about to return home. Deceived by this manoeuvre, the Trojans brought the gigantic horse into the city, and the men who had been concealed within it, stealing out in the night-time, unbarred the gates, and admitted the Grecian army within the walls. The siege of Troy forms the subject of Homer's sublime poem, the 'Iliad,' in which the real events of the war are intermingled with many fictitious and supernatural incidents.

The Greek princes discovered that their triumph over Troy was dearly paid for by their subsequent sufferings, and the disorganisation of their kingdoms at home. Ulysses, if we may believe the poets, spent ten years in wandering over seas and lands before arriving in his island of Ithaca. Others of the leaders died or were shipwrecked on their way home, and several of those who succeeded in reaching their own dominions, found their thrones occupied by usurpers, and were compelled to return to their vessels, and seek in distant lands a place of rest and security for their declining years. But the fate of Agamemnon, the renowned general of the Greeks, was the most deplorable of all. On his return to Argos, he was assassinated by his wife Clytemnestra, who had formed an attachment during his absence to another person. Agamemnon's son, Orestes, was driven into exile, but afterwards returned to Argos, and putting his mother and her accomplices to death, established himself upon the throne.

About eighty years after the termination of the Trojan war, an extensive revolution took place in the affairs of Greece, in consequence of the subjugation of nearly the whole Peloponnesus by the descendants of Hercules. It has already been mentioned that that hero, who was a member of the royal family of Mycenæ or Argos, had been driven into exile by some more successful candidate for the throne of that state. After the hero's death, his children sought refuge in Doris, the king of which became subsequently so much attached to Hyllus, the eldest son of Hercules, that he constituted him the heir of his throne. Twice the Heraclidian princes unsuccessfully attempted to establish themselves in the sovereignty of the Peloponnesus, which they claimed as their right; but on the third trial, they accomplished their object. In the year 1104 B. C., three brothers named Temenus, Cresphontes, and Aristodemus, said to have been the great-grandsons of Hyllus, invaded the Peloponnesus at the head of the Dorians, and conquered the greater part of it, with the exception of the province of Arcadia, the mountainous character of which enabled its inhabitants to defend it with success against the invaders.

Temenus obtained the kingdom of Argos, Cresphontes established himself in Messenia, and as Aristodemus had died during the war, his twin sons Eurysthenes and Procles shared between them the throne of Sparta. The thrones of Corinth and Elis were occupied by other branches of the Heraclidian family. The Dorian troops were rewarded with the lands of the conquered inhabitants, who were driven out of the Peloponnesus, or reduced to slavery. Great numbers of the Peloponnesians, who were expatriated by the Dorian invaders, passed over into Asia Minor, where they founded several colonies in a district afterwards called *Æolia*, from the name of the people by whom these colonies were established. Others took refuge in Attica, where the Athenians received them in a friendly manner. This, it

would appear, gave offence to the new rulers of the Peloponnesian states, and war was commenced between the Dorians and the Athenians. In the year 1070 B. C., Attica was invaded by a numerous army of the Peloponnesians, and Athens itself seemed menaced with destruction. This emergency produced a display of patriotic devotion on the part of Codrus, the Athenian king, which has rarely been paralleled in the annals of mankind, and deserves to be held in everlasting remembrance:—

At Delphi in Phocis there was a temple of Apollo, to the priests of which the Greeks were wont to apply for information regarding future events, in the same manner as the people of comparatively recent times were accustomed to consult astrologers, soothsayers, and other artful impostors on similar questions. Now Codrus had learned that the Peloponnesians had received at Delphi a prophetic response, to the effect that they should not be victorious in the war, if they did not kill the Athenian king. Determined to save his country at the expense of his own life, Codrus disguised himself in a peasant's dress, and entering the Peloponnesian camp, provoked a quarrel with a soldier, by whom he was killed.

It was not long until the dead body was recognised to be that of the Athenian king, and the Peloponnesians, remembering the condition on which the oracle had promised them success, were afraid to continue the contest any longer, and hastily retreated into their own territories. The Athenians were filled with admiration when they heard of the noble conduct of their monarch, and in the height of their gratitude, they declared that none but Jupiter was worthy of being their king after such a prince as Codrus.

It is supposed that they were partly induced to make this declaration by finding the sons of Codrus evince an inclination to involve the country in a civil war regarding the succession to the throne. The Athenians therefore abolished royalty altogether, and appointed Medon, Codrus's eldest son, under the title of *Archon*, as chief magistrate of the republic for life; the office to be hereditary in his family as long as its duties should be performed to the satisfaction of the assembly of the people. And as Attica was overcrowded with the Peloponnesian refugees, these, together with a large body of Athenians, were sent into Asia Minor, under the charge of Androclus and Neleus, the younger sons of Codrus, to plant colonies to the south of those already formed in *Æolia*. The settlers founded twelve cities, some of which afterwards rose to great wealth and splendour. *Ionis* was the name bestowed upon the district, in reference to the Ionic stock from which the Athenians drew their descent.

Several Dorian colonies in Caria, a province still farther south than Ionia, completed the range of Grecian settlements along the western coast of Asia Minor. Cyprus, Rhodes, the coast of Thrace, and the islands of the *Ægean* Sea, together with a considerable portion of Italy and Sicily, and even of France and Spain, were also colonised by bands of adventurers, who at various periods emigrated from Greece; so that, in process of time, the Grecian race, language, religion, institutions, and manners, instead of being confined to the comparatively small country constituting Greece proper, were diffused over a very extensive region, comprising the fairest portions of Europe and of western Asia.

While this work of colonisation was going forward, the parent states of Greece were torn with internal dissensions, and were perpetually harassing each other in wars, of which the objects and incidents are now equally uncertain. Almost all that is known of the history of the two centuries immediately following the death of Codrus is, that they were characterised by great turbulence and confusion, and that, during their lapse, many of the Grecian states and colonies followed the example of Athens by abolishing monarchy. Others did not, till a later period, become republican, and Sparta long retained the singular form of regal government established there at the accession of the twin brothers

Eurytheneas and Procles, the descendants of whom continued for several centuries to reign jointly in Lacedæmon, though, practically speaking, no state of Greece was more thoroughly republican in many important respects.

Greece had been all along divided into a number of independent states, and after the abolition of kingly government, several of these were split up into as many distinct republics as the state contained of towns. These divisions of the country, and the obstacles which the almost incessant wars interposed to a free communication between the inhabitants of the different districts, necessarily prevented the advancement of the Greeks in knowledge and civilisation; but fortunately, a king of Elis, named Iphitus, at length devised an institution by which the people of all the Grecian states were enabled, notwithstanding their quarrels and wars with one another, to meet periodically on friendly terms, and communicate to each other such information as might be useful for the improvement and welfare of the whole.

This institution was the Olympic Festival. From a very remote period, the Greeks had been accustomed to engage in contests of strength and agility during their times of festivity, and also at the funerals of distinguished personages. Iphitus conceived the idea of establishing a periodical festival in his own dominions for the celebration of these ancient games, and of religious rites in honour of Jupiter and Hercules; and having obtained the authority of the Delphian oracle for carrying his design into execution, he instituted the festival, and appointed that it should be repeated every fourth year at Olympia, a town of Elis.

To this festival he invited all the people of Greece; and that none might be prevented from attending it by the wars in which any of the states might be engaged, the Delphic oracle commanded that a general armistice should take place for some time before and after each celebration. The date of the establishment of the Olympic Games (884 B.C.) was afterwards assumed by the Greeks as the epoch from which they reckoned the progress of time; the four years intervening between each recurrence of the festival being styled an *Olympiad*.

Three other institutions of a similar nature were afterwards established—namely, the Isthmian Games, celebrated near Corinth; the Pythian, at Delphi; and the Nemean, in Argolis. These took place on the various years which intervened between the successive festivals at Olympia; but although they acquired considerable celebrity, none of them rose to the importance and splendour of that of Iphitus. The games which were celebrated at the festivals consisted of foot and chariot races, wrestling and boxing matches, and other contests requiring strength and agility, together with competitions in poetry and music. The victors were crowned with an olive wreath; an honour which it was esteemed by the Greeks one of the highest objects of ambition to attain.

#### Mythology and Religious Rites.

The religious beliefs and observances of the Greeks, constituting their mythology, are intimately connected with the fabulous and poetical portion of their history. It has already been stated that Uranus, his son Saturn, and his grandsons Jupiter, Neptune, and Pluto, appear to have been the chiefs of a colony of Egyptians who settled in Greece at an exceedingly remote period, and that after their death their ignorant posterity came in course of time to regard them as gods, and to pay them divine honours accordingly. Some, however, are disposed to think that the Greeks borrowed their notions respecting these and several others of their deities from Egypt and Phœnicia, where they had been worshipped long before their introduction into Greece by the colonies from these countries. But whether this was really the case or not, it is certain that the Greeks greatly embellished the history, and augmented the number, of their fabulous divinities, so that at last they amounted

to many thousands, of various degrees of dignity and importance.

According to the poets, who were the principal framers and expounders of the Grecian mythology, Jupiter, the chief of the gods, and the ruler of heaven and earth, was the son of Saturn, a god who had been compelled by a powerful and tyrannical brother, named Titan, to promise that he would destroy all his male children. This promise Saturn for some time fulfilled by devouring his sons as soon as they were born; but at last Rhea, his wife, contrived to conceal the birth of Jupiter, Neptune, and Pluto, who thus escaped the fate of their brethren. On discovering that Saturn had male offspring alive in contravention of his engagement, Titan deposed him from his authority, and cast him into prison. But Jupiter, having grown up to manhood, overcame Titan in turn, and restored Saturn to his throne. These vicissitudes, it is to be observed, and others that befell the early divinities, were the result of the decrees of Fate; a power over which the heathen gods are represented as having had no control.

Notwithstanding this filial conduct of Jupiter, he afterwards quarrelled with his father, whom he dethroned and chased into Italy, where Saturn is said to have passed his time in a quiet and useful manner, occupied solely in teaching the rude inhabitants to cultivate and improve the soil. He was afterwards known (under the name of Chronos) as the god of Time, and was usually represented under the figure of an old man, holding in one hand a scythe, and in the other a serpent with its tail in its mouth, in allusion to the destructive influence of time, and the endless succession of the seasons. The rule of Saturn in Italy was productive of so much happiness, that the period ever afterwards was called the Golden Age.

After Saturn had been driven into exile, his three sons divided his dominions amongst them. Jupiter reserved to himself the sovereignty of the heavens and the earth, Neptune obtained the empire of the sea, and Pluto received as his share the sceptre of the infernal regions. Jupiter did not, however, enjoy unmolested his supreme dignity, for the offspring of Titan, a race of terrible giants, set the new deity at defiance, and by piling the mountains named Pelion and Ossa on the top of one another, endeavoured to ascend into heaven, to pluck him from his throne. The gods, in great alarm, fled from their divine abode on Mount Olympus into Egypt, where they concealed their true character by assuming the forms of various animals; but Jupiter, assisted by Hercules, at last succeeded in destroying the giants, and reasserting his sovereign sway. Jupiter is always represented on a throne with thunderbolts in his right hand, and an eagle by his side.

Jupiter took in marriage his sister Juno, who is described as a beautiful but ill-tempered goddess, and is usually depicted as seated in a chariot drawn by two peacocks. Neptune, the brother of Jupiter, and god of the ocean, is painted as a half-naked man, of majestic figure, with a crown on his head, and a trident or three-pronged fork in his hand, drawn in a car over the sea by water horses. Pluto, the remaining brother of Jupiter, and god of the infernal regions, was painted as seated on a throne, with his wife Proserpine by his side, and the three-headed dog Cerberus before him.

Nine of the most important of the deities were considered as the children of Jupiter. Apollo was the god of music, poetry, painting, and medicine; he is represented as a young man, of great elegance of person, with a bow in his hand, and a quiver of arrows at his back. Mars, the god of war, is drawn as an armed man in a car, with an inferior female deity, named Bellona, by his side. Bacchus was the god of wine, and was usually represented as a young man with a cup in one hand, and a spear called a thyrsus in the other. His name has given rise to many phrases in our language expressive of circumstances connected with drinking. Mercury was the messenger of Jupiter, and the god of oratory, of merchandise, and of thieving. He was represented as a youth flying along the air,

with wings at his cap and heels, and a peculiar wand called a caduceus in his hand. Minerva, the goddess of wisdom, was painted as a female of severe aspect, armed on the head and breast, and bearing a spear and shield, while an owl sits by her side. Venus, the goddess of beauty and love, was depicted as a handsome woman, in undress. Diana, the goddess of hunting and of chastity, appeared as a beautiful female, with bow and arrow in her hands, buskins on her limbs, and a crescent on her forehead. Hebe, the goddess of youth, took the form of a blooming young girl, and was said to bear the cup of Jupiter.

Another of the children of Jupiter was Vulcan, who employed himself as an artificer in iron, and hence he has been assumed as the patron of blacksmiths. Jupiter is said to have employed him in fabricating his thunderbolts. The workshop of Vulcan was believed to be underneath the burning mountain Ætna, in Sicily; and the modern term *volcano* is derived from that circumstance.

Besides the other attributes and avocations of Apollo, he was the deity of the sun, having the task confided to him of guiding that luminary in its diurnal course through the heavens. His sister Diana had a similar charge over the moon. Apollo, or Phœbus, as he was also named, had a son called Phaethon, who, being, like many other young people, self-confident and rash, took advantage of the indulgent disposition of his father to obtain from him the charge of the chariot of the sun for one day. But Phaethon had not travelled far on his journey up the heavens, when his fiery steeds became unmanageable, and running away with the sun, they descended so close to the earth, that that body was set on fire. Jupiter perceived what had happened, and fearing that the universe might be consumed, he struck Phaethon dead with a thunderbolt; then, after a good deal of trouble, he extinguished the conflagration, and set the sun once more on its usual course.

None of the heathen deities is more frequently referred to than Cupid, the god of love. He was the son of Venus, and bore the aspect of a beautiful boy. He had a pair of wings, and was furnished with a bow and a quiver of arrows, which he shot into the hearts of those whom he wished to inflame with the tender passion over which he had control.

There was a number of divinities of minor importance. Hymen was the god of marriage, and was represented with a crown of flowers on his head and a lighted torch in his hand. Æolus was the god of the winds, which he kept confined in caverns, except at such times as he chose to let them loose upon the world. Pan was the god of the country. He was horned, and had legs, feet, and a tail resembling those of a goat. His favourite haunt was the vales of Arcadia, where he attracted the shepherds around him in admiration by the sweet sounds of his rustic pipe.

Ceres was the goddess of agriculture, and had a beautiful daughter named Proserpine, who was carried off by Pluto while she was gathering flowers on the plains of Sicily, and installed as the queen of the infernal regions. Ceres, in despair at the loss of her daughter, and uncertain as to her fate, lighted a torch at Mount Ætna, and sought for her over the whole earth. In the course of her wanderings she arrived in Attica, and finding its inhabitants ignorant of husbandry, furnished them with grain, and taught them how to cultivate their fields. She at the same time instituted the secret religious ceremonies at Eleusis, which were afterwards known by the name of the *Eleusinian Mysteries*. Ceres then continued her search for her daughter, and at length obtained information of what had happened to her. She immediately ascended to heaven and demanded redress from Jupiter, who promised to compel Pluto to restore Proserpine, provided she had eaten nothing since her descent into hell. On inquiry, it was ascertained that she had eaten some pomegranates, so that her return to the upper world was, according to the laws of the infernal regions, impracticable. But Jupiter, compassionating her disconsolate parent, or-

dered that Proserpine should divide her time between her mother and her husband, residing six months with each alternately.

Astræa was the goddess of justice, and during the Golden Age, when men were virtuous and happy, she dwelt, like many other deities, on earth; but after the world became wicked, she bade it a sorrowful farewell, and ascending to heaven, was transformed into the sign of the zodiac which is named *Virgo*, or the Virgin. Themis was the goddess of law, and after the departure of Astræa, she had also to sustain, as well as she was able, the character of the goddess of justice. We see in this, as in some other of these mythic fables, no small degree of meaning.

Inexorable destiny, which governs all things, was personified by three sisters called the *Fates*, who represented the Past, the Present, and the Future. They were poetically described as constantly employed in spinning the thread of human life. One held the distaff, another span, and the third cut the thread when it had reached its appointed length. To the decrees of these stern sisters even Jupiter himself was obliged to bend, and his thunders, which affrighted all the other divinities, were heard by them undisturbed.

The *Furies* were also three in number, and to them belonged the task of punishing the guilty both on earth and in hell. Instead of hair, their heads were covered with twining serpents, and their looks were fierce and terrible. Each of the sister Furies waved a blazing torch in the one hand, while the other wielded a plaited scourge. The latter instrument inflicted remorseless punishment on those who had incurred the anger of the gods. Wars, famine, and pestilence—the penalty of vice and crime—proceeded from these dread sisters, and *Grief*, *Terror*, and *Madness* were painted as their inseparable followers.

These avengers of guilt form a striking contrast to another sisterly trio, to whom the ancients gave the name of the *Graces*. The Graces were named Aglaia, Thalia, and Euphrosyné, and their aspect and attributes corresponded with the common name they bore. They were the daughters of young Bacchus and Venus, and were usually represented as unattired, and linked in each other's arms.

The nine *Muses* were named Thalia, Melpomené, Calliopé, Clio, Erato, Euterpé, Polyhymnia, Terpsichoré, and Urania. They were the patronesses of literature and the fine arts, and resided on Parnassus, a lofty mountain in the district of Phocia. Thalia presided over comedy; Melpomene over tragedy; Erato over amatory poetry; Polyhymnia over lyric poetry; Calliope over heroic or epic poetry and eloquence; Clio over history; Euterpe over music; Terpsichore over dancing; and Urania over the studies of astronomy and astrology.

There was a class of demi-gods, who filled imaginary places in every corner both of earth and sea. The shady groves and flowery vales were peopled by Dryads or wood-nymphs, and Satyrs, a species of rural deities, who, like Pan, had the horns, legs, and feet of a goat. Mountains and streams possessed their guardian gods and goddesses, and every fountain had its Naiad or water-nymph. In short, whatever sound or sight in nature charmed their fancy, the Greeks ascribed the pleasure to the agency of unseen, but beautiful and immortal beings. Physical beauty was, nevertheless, much more prominent than moral in the divinities shaped out by the imagination of the Greeks. Their gods were represented as mingling in the affairs of mortals, and frequently lending their superior power and intelligence to the promotion of schemes of vice and villany. They were animated by envy, malice, and all the evil passions to which men are subject, and they did not hesitate to adopt any measures, however base, to gratify their nefarious purposes.

Yet, strange as it may seem, most of the Greeks appear to have been impressed with sincere religious feelings, and believed in a future state of rewards and punishments. They imagined that, after death, the

souls of men descended to the shores of a dismal and pestilential stream called the Styx, where Charon, a grim-looking personage, acted as ferryman, and rowed the spirits of the dead across the melancholy river, the boundary of the dominions of Pluto. To obtain a passage in Charon's boat, it was necessary that the deceased should have been buried. Those who were drowned at sea, or who were in any other manner deprived of the customary rites of sepulture, were compelled to wander about on the banks of the Styx for a hundred years before being permitted to cross it.

After quitting the vessel of Charon, the trembling shades advanced to the palace of Pluto, the gate of which was guarded by a monstrous dog, named Cerberus, which had three heads, and a body covered with snakes instead of hair. They then appeared before Minos, Rhadamanthus, and Acanthus, the three judges of the infernal regions, by whom the wicked were condemned to torments, and the good rewarded with heavenly pleasures.

Tartarus, the place of punishment, was the abode of darkness and horror. There Tantalus, for a vile crime done in life, remained perpetually surrounded with water, which fled from his lips whenever he attempted to quench his burning thirst, while over his head hung branches laden with the most inviting fruits, which shrunk from his grasp as often as he stretched out his hand to pluck them. There also was Ixion, bound with serpents to the rim of a wheel, which, constantly revolving, allowed no cessation of his agonies. Another variety of punishment was allotted to Sisyphus, who was condemned to the endless task of rolling a huge stone up the side of a steep mountain, which he had no sooner accomplished, than it rolled down again to its former place. On one side criminals were writhing under the merciless lash of the avenging Furies, and on another were to be seen wretches surrounded with unquenchable flames.

Elysium, the abode of the blessed, was a region of surpassing loveliness and pleasure. Groves of the richest verdure, and streams of silvery clearness, were to be met with on every side. The air was pure, serene, and temperate, the birds continually warbled in the woods, and a brighter light than that of the sun was diffused throughout that happy land. No cares nor sorrow could disturb its inhabitants, who spent their time in the untiring enjoyment of those pleasures they had loved on earth, or in admiring the wisdom and power of the gods.

The Greeks were pre-eminently an imaginative people, and accordingly both their mythology and their religious rites were calculated rather to amuse the fancy than to interest the feelings or improve the heart. Their public worship was altogether ceremonial. In magnificent temples they invoked and offered sacrifices to the gods, and the solemn festivals of their religion consisted of pompous processions, public games, dramatic entertainments, feasting, and masquerading. To these were added, in the worship of Bacchus, drunkenness, indecency, uproar, and every species of licentiousness. It was no business of the priests to inculcate lessons of instruction or morality; the only doctrine taught by them was, that the gods demanded slavish adulation, and an outward show of reverence from their worshippers, who would be rewarded with the divine favour in proportion to the abundance and costliness of their offerings.

Besides the public services of religion, there were certain secret rites, performed only by the initiated, in honour of particular divinities. The most remarkable of these mystical observances were the feasts celebrated at Eleusis in Attica, in honour of the goddess Ceres. They were called, by way of eminence, the *Mysteries*; and all who were initiated in them were bound by the most solemn oaths never to reveal them.

The gods were supposed to communicate with men, and to reveal the secrets of futurity by means of oracles, several of which existed in various parts of Greece. One of the earliest, and for some time most celebrated

of these, was that of Dodona in Epirus. Near that place there was a grove of oaks, which, according to the superstitious belief of the ancients, chanted the message of Jupiter to devout inquirers. Black pigeons were also said to frequent this grove, and to give oracular responses. The oracle at Dodona is believed to have owed its origin to an artful woman, who had been stolen from a temple of Jupiter in Egypt, and sold as a slave in Epirus. To escape from the evils of her degraded condition, she resolved to work upon the ignorance and credulity of those among whom she had been brought; and stationing herself in the grove of oaks, which afterwards became so famous, she gave out that she was inspired by Jupiter, and could foretell future events. The scheme succeeded, and she soon acquired great repute for her skill in divination; and after her death, other artful persons were not backward in embracing a profession which was rewarded both with profit and respect.

But by far the most celebrated of the Grecian oracles was that of Apollo at Delphi, a city built on the slopes of Mount Parnassus, in Phocis. At a very remote period, it had been discovered that from a deep cavern in the side of that mountain an intoxicating vapour issued, the effect of which was so powerful as to throw into convulsions both men and cattle. The rude inhabitants of the surrounding district, unable to account for this phenomenon, conceived that it must be produced by supernatural agency, and regarded the incoherent ravings of those who had inhaled the noxious vapour as prophecies uttered under the inspiration of some god. As the stupifying exhalation ascended out of the ground, it was at first conjectured that the newly-discovered oracle must be that of the very ancient goddess *Earth*; but Neptune was afterwards associated with this divinity, as an auxiliary agent in the mystery. Finally, the whole credit of the oracle was transferred to Apollo. A temple was soon built on the hallowed spot, and a priestess, named the *Pythoessa*, was appointed, whose office it was to inhale, at stated intervals, the prophetic vapour. To enable her to do so without the risk of falling into the cavern, as several persons had previously done, a seat, called a *tripod*, from its having three feet, was erected for her accommodation directly over the mouth of the chasm.

Still, however, the Pythoessa held an office which was neither safe nor agreeable. The convulsions into which she was thrown by the unwholesome vapours of the cavern, were in some instances so violent as to cause immediate death, and were at all times so painful, that force was often necessary to bring the official to the prophetic seat. The unconnected words which the Pythoessa screamed out in her madness were arranged into sentences by the attendant priests, who could easily place them in such an order, and fill up the breaks in such a way, as to make them express whatever was most suitable to the interests of the *shrines*, which was the main object. Lest the oracle should be brought into discredit, care was in general taken to couch the response in language so obscure and enigmatical, that whatever course events should take the prediction might not be falsified, or rather might appear to be verified. It may be observed that, in the course of time, some method of simulating convulsions was most probably adopted by the chief agent in these impositions.

The fame of the Delphic oracle soon became very extensive, and no enterprise of importance was undertaken in any part of Greece, or of its numerous colonies in the islands and along the coasts of the *Ægean* and *Mediterranean Seas*, without a consultation of the Pythoessa. The presents received from those who resorted to it for counsel, not a few of whom were princes, or influential and wealthy leaders, formed a source of great and permanent revenue to the institution, and not only afforded the officiating priests a comfortable maintenance, but furnished also the means of erecting a splendid temple, instead of the rude edifice which had been originally constructed.

## HISTORY OF GREECE.

The high veneration in which the Delphic oracle was held, gave its directors a large share of influence in public affairs; an influence which they sometimes exerted in a most commendable manner, in sanctioning and furthering the schemes of the statesmen, legislators, and warriors, who undertook to improve the political systems, reform the laws and manners, or defend the liberties of Greece. Like the Olympian Festival, it also formed a bond of union among the numerous independent communities of Greece, and by lending the authority of the gods to measures of general utility, often repressed petty jealousies and quarrels among the different states, and excited all to study the common welfare.

Even when the rest of Greece was vexed by civil war, the chosen territory of Apollo was undisturbed by the din of arms; and the security which it enjoyed on account of its sacred character, caused Delphi to become a place of deposit for much of the wealth of the states. Lest the fear of divine vengeance should not prove a sufficiently strong consideration to deter the warlike communities by which Delphi was surrounded from plundering a temple in which so much treasure was accumulated, the sanctuary was placed under the special protection of a Directory termed the Amphictyonic Council.

This council consisted of two deputies from each of the principal states of Greece, and its duties were to effect, by its recommendation and authority, a settlement of all political and religious disputes which might arise between the various communities, and to decide upon proposals of peace or war with foreign nations. The date of its establishment is uncertain, but it is supposed to have been in existence as early as the fourteenth or fifteenth century before the Christian era; that is to say, about 200 or 300 years before the war of Troy. Amphictyon, its founder, is asserted by some to have been a king of Attica, and by others to have reigned over not only that district, but the whole of Greece to the south of Thessaly.

In the course of the eleventh century before Christ, the Greeks began to plant colonies in neighbouring countries. The first colonists, as usually happens in the present day, were dissatisfied citizens, who thought they could form happier communities elsewhere. The Æolians founded twelve cities in Asia Minor, the chief of which was Smyrna. The Dorians sent off colonies to Italy and Sicily, founding, in the former, Tarentum and Locri, and in the latter, Agrigentum and Syracuse. In the new settlements, the political system was eminently democratic, and for a long time they enjoyed great prosperity. This prosperity being ascribed at home to their popular institutions, had afterwards the effect of inciting many of the parent states to change their monarchical for a democratic form of government.

### SECOND OR AUTHENTIC PERIOD OF HISTORY.

The second and authentic period of Greek history commences in the year 884 B. C., at the institution of the Olympic Festival, when the people had begun to emerge from their primitive barbarism. This festival, as already stated, was instituted by direction of the Delphic oracle, by Iphitus, Prince of Elis, for the patriotic purpose of assembling together, in a peaceful manner, persons from all parts of Greece. The festival was ordained to take place once every four years, in the month corresponding to our July, and to last five days, during which there was to be complete truce, or cessation from war, throughout the Grecian states. Agreeably to the ancient practice at public solemnities, the festival was celebrated by games and various feats of personal skill, and the whole order of procedure was regulated with extraordinary care. All freemen of Grecian extraction were invited to contend, provided they had been born in lawful wedlock, and had lived untainted by any infamous moral stain. No women (the priestesses of Ceres excepted) were permitted to be present. Females who violated this law were thrown from a rock. The competitors prepared themselves

during ten months previous at the gymnasium at Elis. During the last thirty days, the exercises were performed with as much regularity as at the games themselves. The festival began in the evening with solemn sacrifices, and the games were commenced the next day at daybreak. These consisted in races on horseback and on foot, in leaping, throwing the discus or quoit, wrestling, and boxing; musical and poetical contests concluded the whole. The honour of having gained a victory in the Olympic Games was very great; it extended from the victor to his country, which was proud of owning him. However rude and boisterous were some of the sports of the Olympic Festival, it was acknowledged by the best authorities that they were attended with manifold advantages to society. It is sufficient barely to mention the suspension of hostilities, which took place not only during the festival, but a considerable time both before and after it. Considered as a kind of religious ceremony, at which the whole Grecian citizens were invited, and even enjoined, to assist, it was well adapted to facilitate intercourse, to promote knowledge, to soften prejudice, and to hasten the progress of civilisation and humanity.

At the first institution of the Olympic Festival, and for one or two centuries afterwards, the condition of Grecian society was primitive, and almost patriarchal, but marked by strong features of heroic dignity, and a certain depth and refinement of thought. The attire of the men was very simple, consisting only of a shirt or close jacket to the body, with a loose robe hanging down over the naked limbs, while performers in the public games were almost naked. The arts, including agriculture, were also little advanced; few persons seemed to have thought of toiling to accumulate wealth; and each community presented, in time of peace, the picture of a large family. That portion of the people constituting the freemen lived much in public, or in the society of their equals, enjoyed common pleasures and amusements, and had daily opportunities of displaying their useful talents in the sight of their fellow-citizens. The frequent disputes between individuals occasioned litigations and trials, which furnished employment for the eloquence and ability of men in the necessary defence of their friends. The numerous games and public solemnities opened a continual source of entertainment, and habituated every man to active physical exercise, and the performance of his duties as a soldier. These were agreeable features in the condition of Grecian society; but there were also some of an opposite character. The people were of an unsettled disposition, never satisfied long with any kind of government which existed amongst them, and very much disposed to wage war against neighbouring states on the most trifling pretences.

The population of the various states was divided into three classes—namely, the citizens, the enfranchised populace, and the slaves. All political power, even in the most democratical of the Grecian communities, was possessed by the first of these classes, while in the oligarchical states, only that small portion of the citizens which constituted the nobility or aristocracy possessed any influence in the management of public affairs. The mechanical and agricultural labours necessary for the support and comfort of the whole, were chiefly performed by the inferior class of free inhabitants, who did not enjoy the privilege of citizenship, and by the slaves, who formed a considerable portion of the population of every state. These slaves were sprung from the same general or parent stock, spoke the same language, and professed the same religion, as their masters. They were in most cases the descendants of persons who had been conquered in war, but were in some instances acquired by purchase. Society being thus based on vicious principles, it is not wonderful that the Grecian states were the scene of constant civil broils.

### Sparta—Lycurgus.

At the beginning of this period of Grecian history, our attention is powerfully attracted by a very remarkable

series of proceedings which took place in Lacedæmon, or Laconia, a country of southern Greece, of which the chief city was Sparta. This city being in a state of intestine disorder, it was agreed by many of the inhabitants to invite Lycurgus, the son of one of their late kings, to undertake the important task of preparing a new constitution for his country. Fortified with the sanction of the Delphic oracle, he commenced this difficult duty, not only settling the form of government, but reforming the social institutions and manners of the people. The government he established consisted of two joint kings, with a limited prerogative, and who acted as presidents of a senate of twenty-eight aged men. The functions of the senate were deliberative as well as executive, but no law could be passed without receiving the consent of the assembled citizens. The most remarkable of the arrangements of Lycurgus was his attempt to abolish difference of rank, and even difference of circumstances, among the people. He resolved on the bold measure of an equal division of lands, and actually parcelled out the Laconian territory into 39,000 lots, one of which was given to each citizen of Sparta, or free inhabitant of Laconia. Each of these lots was of such a size as barely sufficed to supply the wants of a single family—for Lycurgus was determined that no person should be placed in such circumstances as would permit of luxurious living.

Lycurgus carried into effect a number of other visionary projects: he abolished the use of money, with the hope of preventing undue accumulation of wealth; prohibited foreigners from entering the country, and the natives from going abroad, in order to preserve simplicity of manners among the people; directed that all men, without distinction of rank or age, should eat daily together at public tables, which were furnished with the plainest food; and finally, ordained that all the children who were born, and seemed likely to be strong, should be reared by public nurses, under a rigid system of privation and personal activity, while the weak infants should be thrown out to the fields to perish. The citizens, when they had attained the age of manhood, were engaged in martial exercises, all labour being left to the slaves, or *helots*, as they were termed; and in short, the whole nation was but a camp of soldiers, and war was reckoned the only legitimate profession. These laws were in some measure suited to the rude condition of the Spartans, but, as being opposed to some of the best and strongest principles in human nature, they could not possibly endure, and there is reason to believe that some of them were not strictly enforced. It is not unusual to see historians use the term *Spartan virtues* with a certain degree of admiration of its quality; but the Spartans had, in reality, no moral dignity, certainly no benevolence, in their virtue, either public or private. They were a small confederacy of well-trained soldiers; and merely as such, deserve no mark of our respect or esteem. The manner in which they used their *helots* was at once barbarous and cruel. The murder of a serf by a free citizen was not punishable by law; nay, it was even allowable for the young Spartans to lie in wait, as a kind of sport, for any good-looking or saucy-looking slave, and stab him to the heart on the highway. It is certain that at one time, when the *helots* had stood their masters in good stead in battle, they were desired, by way of reward, to choose out 2000 of their best men, that they might receive their freedom, and be enrolled as Spartans, and that these 2000 men were all silently murdered soon after. At another time, when danger was apprehended from the growing numbers and petty wealth of the boors, the senate enacted the farce of declaring war against them, and coolly murdered many thousands, in order to thin their numbers and break their spirit. Had there been any redeeming trait in the Spartan character to compensate for such barbarity, one would have wondered less at the respect which is sometimes paid them; but their military fame only adds another instance to the many already on record, that the most ignorant and savage tribes make the most dogged soldiers.

## Athena.

We now turn to Athens, the capital of Attica, and long the principal seat of Grecian learning and refinement. Athens is said to have been founded by Cecrops, 1550 B.C., and in the most ancient times was called Cecropia. It probably received the name of Athens from the goddess Minerva, who was called also Athena by the Greeks, and to whom an elegant temple had been erected in the city. The old city spread from the mount of the Acropolis over a wide and pleasant vale or low peninsula, formed by the junction of the Cephesus and Ilissus. Its distance from the sea-coast was about five miles. In the course of time Athens became populous and surpassingly elegant in its architecture, while its citizens contrived to take a lead in the affairs of the communities around. At first they were governed by kings, but, as in the case of the Spartan citizens, they became dissatisfied with their existing constitution, and about the year 600 B.C. invited Solon, one of the wisest men in Greece, to reorganise their political constitution. Solon obeyed the summons, and constituted the government on a broad republican basis, with a council of state, forming a judicial court, consisting of 400 members, and called the Areopagus. This court of Areopagus, besides its other duties, exercised a censorship over public morals, and was empowered to punish impiety, profligacy, and even idleness. To this court every citizen was bound to make an annual statement of his income, and the sources from which it was derived. The court was long regarded with very great respect, and the right was accorded to it of not only revising the sentences pronounced by the other criminal tribunals, but even of annulling the judicial decrees of the general assembly of the people. The regulations of Solon were not maintained for any great length of time, although the republican form of government, in one shape or other, continued as long as the country maintained its independence. Cleisthenes, the leader of a party, enlarged the democratic principle in the state; he introduced the practice of *ostracism*, by which any person might be banished for ten years, without being accused of any crime, if the Athenians apprehended that he had acquired too much influence, or harboured designs against the public liberty. Ostracism was so called, because the citizens, in voting for its infliction, wrote the name of the obnoxious individual upon a shell (*ostræon*). It is said that Cleisthenes was the first victim of his own law, as has happened in several other remarkable cases, ancient and modern.

For a period of about two centuries after the settlement of a republican constitution, there is little of importance to relate in Athenian history. Athens was gradually enlarged, the taste for refinement increased, and various men of sagacious understanding, entitled Philosophers, began to devote themselves to inquiries into the nature of the human mind and the character of the Deity. The principal Grecian philosopher who flourished in this era (550 B.C.) was Pythagoras, a man of pure and exalted ideas, and an able expounder of the science of mind.

## THIRD PERIOD OF HISTORY.

The year 490 B.C. closes the gradually-improving period in Grecian history, or second period, as it has been termed; and now commenced an era marked by the important event of an invasion from a powerful Asiatic sovereign.

## Persian Invasion.

Darius, king of Persia, having imagined the possibility of conquering Greece, sent an immense army against it in the year just mentioned. Greatly alarmed at the approach of such an enemy, the Athenians applied to the Spartans for aid; but that people had a superstition which prohibited their taking the field before the moon was at the full, and as at the time of the application it still wanted five days of that period, they therefore delayed the march of their

troops. Being thus refused all assistance from their neighbours, the Athenians were left to depend entirely on their own courage and resources. A more remarkable instance of a small state endeavouring to oppose the wicked aggression of an overgrown power, has seldom occurred in ancient or modern times; but the constant exercises and training of the Athenian population enabled them to present a bold, and by no means contemptible front to the invader. War had been their principal employment, and in the field they displayed their noblest qualities. They were unacquainted with those highly-disciplined evolutions which give harmony and concert to numerous bodies of men; but what was wanting in skill they supplied by courage. The Athenian, and also other Greek soldiers, marched to the field in a deep phalanx, rushed impetuously to the attack, and bravely closed with their enemies. Each warrior was firmly opposed to his antagonist, and compelled by necessity to the same exertions of valour as if the fortune of the day had depended on his single arm. The principal weapon was a spear, which, thrown by the nervous and well-directed vigour of a steady hand, often penetrated the firmest shields and bucklers. When they missed their aim, or when the stroke proved ineffectual through want of force, they drew their swords, and summoning their utmost resolution, darted impetuously on the foe. This mode of war was common to the soldiers and generals, the latter being as much distinguished in battle by their strength and courage as their skill and conduct. The Greeks had bows, slings, and darts, intended for the practice of distant hostility; but their chief dependence was on the spear and sword. Their defensive armour consisted (as shown in the fig.) of a bright helmet, adorned with plumes, and covering the head, a strong corset defending the breast, greaves of brass descending the leg to the feet, and an ample shield, loosely attached to the left shoulder and arm, which turned in all directions, and opposed its firm resistance to every hostile assault. With men thus organised and accoutred, a battle consisted of so many duels, and the combatants fought with all the keenness of personal resentment. The slaughter in such engagements was correspondingly great, the fight seldom terminating till one of the parties was nearly destroyed, or at least greatly reduced in numbers.

It was a people so animated and prepared that the hosts of Persia were about to encounter. Compelled to meet the invaders unassisted, the Athenians were able to march an army of only 9000 men, exclusive of about as many light-armed slaves, into the field. With Miltiades as their leader and commander-in-chief, they met the Persians in battle on the plain of Marathon, thirty miles from Athens, and by great skill and courage, and the force of their close phalanx of spearmen, completely conquered them. Upwards of 6000 Persians were slain on the field, while the number killed of the Athenians was but 192. This is reckoned by historians one of the most important victories in ancient times, for it saved the independence of the whole of Greece. To the disgrace of the fickle Athenians, they afterwards showed the greatest ingratitude to Miltiades, and put him in prison on a charge of favouring the Persians. He died there the year after his great victory. Soon after, the citizens of Athens, on a plea equally unfounded, banished Aristides, an able leader of the aristocratic party in the state, and who, from his strict integrity and wisdom, was usually entitled 'Aristides the Just.'

On the banishment of this eminent individual, Themistocles, a person who was more democratic in his sentiments, became the leader of the councils of the Athenians. Meanwhile the Grecian liberties were again menaced by the Persians. Xerxes, son of Darius, marched an army across the Hellespont by a bridge of boats from the Asiatic shore, and led it towards the southern part of Greece. The utmost force that the confederated Greeks could oppose to the countless host of Persians did not exceed 60,000 men. Of these, a band of Spartans, numbering 8000 soldiers, under Leonidas their king, was posted at the pass of Thermopylae, to intercept the enemy, and here they discomfited every successive column of the Persians as it entered the defile. Ultimately, foreseeing certain destruction, Leonidas commanded all to retire but 300, with whom he proposed to give the Persians some idea of what the Greeks could submit to for the sake of their country. He and his 300 were cut off to a man. Xerxes took possession of Attica and Athens, but in the naval battle with the Athenian fleet at Salamis, which occurred soon after (October 20, 480 B.C.), his army was utterly routed, and its scattered remains retreated into Asia.

By this splendid victory the naval power of Persia was almost annihilated, and the spirit of its monarch so completely humbled, that he durst no longer undertake offensive operations against Greece. Here, therefore, the war ought to have terminated; but so great and valuable had been the spoils obtained by the confederate forces, that they were unwilling to relinquish such a profitable contest. The war, therefore, was continued for twenty years longer, less, apparently, for the chastisement of Persia, than for the plunder of her conquered provinces.

But now that all danger was over, many of the smaller states, whose population was scanty, began to grow weary of the contest, and to furnish with reluctance their annual contingent of men to reinforce the allied fleet. It was, in consequence, arranged that those states whose citizens were unwilling to perform personal service, should send merely their proportion of vessels, and pay into the common treasury an annual subsidy, for the maintenance of the sailors with whom the Athenians undertook to man the fleet. The unforeseen but natural consequence of this was the establishment of the complete supremacy of Athens. The annual subsidies gradually assumed the character of a regular tribute, and were compulsorily levied as such; while the recusant communities, deprived of their fleets, which had been given up to the Athenians, were unable to offer effectual resistance to the oppressive exactions of the dominant state. The Athenians were thus raised to an unprecedented pitch of power and opulence, and enabled to adorn their city, to live in dignified idleness, and to enjoy a constant succession of the most costly public amusements, at the expense of the vanquished Persians, and of the scarcely more leniently-treated communities of the dependent confederacy.

#### Pericles.

We have arrived at the most flourishing period of Athenian history, during which Pericles rose to distinction, and greatly contributed to the beautifying of the capital. The talents of Pericles were of the very first order, and they had been carefully cultivated by the ablest tutorage which Greece could afford. After serving for several years in the Athenian army, he ventured to take a part in the business of the popular assembly, and his powerful eloquence soon gained him an ascendancy in the national councils; and his power, in fact, became as great as that of an absolute monarch (445 B.C.). Some of the most interesting events of Grecian history now occurred. After a number of years of general peace, a dispute between the state of Corinth and its dependency the island of Corcyra (now Corfu), gave rise to a war which again disturbed the repose of all the Grecian states. Corcyra was a colony of Corinth, but having, by its maritime skill and enterprise, raised itself to a higher pitch of opulence than

its parent city, it not only refused to acknowledge Corinthian supremacy, but went to war with that state on a question respecting the government of Epidamnus, a colony which the Corcyreans had planted on the coast of Illyria. Corinth applied for and obtained aid from several of the Peloponnesian states to reduce the Corcyreans to subjection; while Corcyra, on the other hand, concluded a defensive alliance with Athens, which sent a fleet to assist the island in vindicating its independence. By way of punishing the Athenians for intermeddling in the quarrel, the Corinthians stirred up a revolt in Potidæa, a town of Chalcidice, near the confines of Macedonia, which had originally been a colony of Corinth, but was at this time a tributary of Athens. The Athenians immediately despatched a fleet and army for the reduction of Potidæa, and the Peloponnesians were equally prompt in sending succours to the city. The Corinthians, meanwhile, were actively engaged in endeavouring to enlist in their cause those states which had not yet taken a decided part in the dispute. To Lacedæmon, in particular, they sent ambassadors to complain of the conduct of the Athenians, which they characterised as a violation of a universally-recognised law of Grecian policy—that no state should interfere between another and its dependencies. The efforts of the Corinthians were successful, and almost all the Peloponnesian states, headed by Sparta, together with many of those beyond the isthmus, formed themselves into a confederacy for the purpose of going to war with Athens. Argos and Achaia at first remained neuter. Corcyra, Acarnania, some of the cities of Thessaly, and those of Plataea and Naupactus, were all that took part with the Athenians.

Pericles beheld without dismay the gathering of the storm, but his countrymen were not equally undaunted. They perceived that they were about to be called upon to exchange the idle and luxurious life they were at present leading for one of hardship and danger, and they began to murmur against their political leader for involving them in so alarming a quarrel. They had not at first the courage to impeach Pericles himself, but vented their displeasure against his friends and favourites. Phidias, a very eminent sculptor, whom the great statesman had appointed superintendent of public buildings, was condemned to imprisonment on a frivolous charge; and the philosopher Anaxagoras, the preceptor and friend of Pericles, was charged with disseminating opinions subversive of the national religion, and banished from Athens. Respecting another celebrated individual who at this time fell under persecution, it becomes necessary to say a few words. Aspasia of Miletus was a woman of remarkable beauty and brilliant talents, but she wanted that chastity which is the greatest of feminine graces, and by her dissolute life was rendered a reproach, as she would otherwise have been an ornament, to her sex. This remarkable woman having come to reside in Athens, attracted the notice of Pericles, who was so much fascinated by her beauty, wit, and eloquence, that, after separating from his wife, with whom he had lived unhappily, he married Aspasia. It was generally believed that, for the gratification of a private grudge, she had instigated Pericles to quarrel with the Peloponnesian states, and her unpopularity on this score was the true cause of her being now accused, before the assembly of the people, of impiety and grossly-immoral practices. Pericles conducted her defence in person, and pled for her with so much earnestness, that he was moved even to tears. The people, either finding the accusations to be really unfounded, or unable to resist the eloquence of Pericles, acquitted Aspasia. His enemies next directed their attack against himself. They accused him of embezzling the public money; but he completely rebutted the charge, and proved that he had drawn his income from no other source than his private estate. His frugal and unostentatious style of living must have of itself gone far to convince the Athenians of the honesty with which he had administered the public affairs; for while he was filling the city with

temples, porticoes, and other magnificent works of art, and providing many costly entertainments for the people, his own domestic establishment was regulated with such strict attention to economy, that the members of his family complained of a parsimony which formed a marked contrast to the splendour in which many of the wealthy Athenians then lived.

Confirmed in his authority by this triumphant refutation of the slanders of his enemies, Pericles adopted the wisest measures for the public defence against the invasion which was threatened by the Peloponnesians. Unwilling to risk a battle with the Spartans, who were esteemed not less invincible by land than the Athenians were by sea, he caused the inhabitants of Attica to transport their cattle to Eubœa and the neighbouring islands, and to retire, with as much of their other property as they could take with them, within the walls of Athens. By his provident care, the city was stored with provisions sufficient for the support of the multitudes which now crowded it; but greater difficulty was found in furnishing proper accommodation for so vast a population. Many found lodgings in the temples and other public edifices, or in the turrets on the city walls, while great numbers were obliged to construct for themselves temporary abodes in the vacant space within the long walls extending between the city and the port of Piræus.

The memorable contest of twenty-seven years' duration, called 'the Peloponnesian War,' now commenced (431 B. C.). The Spartan king, Archidamus, entered Attica at the head of a large army of the confederates, and meeting with no opposition, proceeded along its eastern coast, burning the towns, and laying waste the country in his course. When the Athenians saw the enemy ravaging the country almost up to their gates, it required all the authority of Pericles to keep them within their fortifications. While the confederates were wasting Attica with fire and sword, the Athenian and Corcyrean fleets were, by the direction of Pericles, avenging the injury by ravaging the almost defenceless coasts of the Peloponnesus. This, together with a scarcity of provisions, soon induced Archidamus to lead his army homewards. He retired by the western coast, continuing the work of devastation as he went along.

Early in the summer of the following year, the confederates returned to Attica, which they were again permitted to ravage at their pleasure, as Pericles still adhered to his cautious policy of confining his efforts to the defence of the capital. But an enemy far more terrible than the Peloponnesians attacked the unfortunate Athenians. A pestilence, supposed to have originated in Ethiopia, and which had gradually spread over Egypt and the western parts of Asia, broke out in the town of Piræus, the inhabitants of which at first supposed their wells to have been poisoned. The disease rapidly advanced into Athens, where it carried off a great number of persons. It is described as having been a species of infectious fever, accompanied with many painful symptoms, and followed, in those who survived the first stages of the disease, by ulcerations of the bowels and limbs. Historians mention, as a proof of the singular virulence of this pestilence, that the birds of prey refused to touch the unburied bodies of its victims, and that all the dogs which fed upon the poisonous relics perished. The mortality was dreadful, and was of course greatly increased by the overcrowded state of the city. The prayers of the devout, and the skill of the physicians, were found equally unavailing to stop the progress of the disease; and the miserable Athenians, reduced to despair, believed themselves to be forgotten or hated by their gods. The sick were in many cases left unattended, and the bodies of the dead allowed to lie unburied, while those whom the plague had not yet reached, openly set at defiance all laws, human and divine, and rushed into every excess of criminal indulgence.

Pericles was in the meantime engaged, with a fleet of 150 ships, in wasting with fire and sword the shores of the Peloponnesus. At his return to Athens, finding

that the enemy had hastily retired from Attica, through fear of the contagion of the plague, he despatched the fleet to the coast of Chalcidice, to assist the Athenian land forces who were still engaged in the siege of Potidea—an unfortunate measure, productive of no other result than the communication of the pestilence to the besieging army, by which the majority of the troops were speedily swept away. Maddened by their sufferings, the Athenians now became loud in their murmurs against Pericles, whom they accused of having brought upon them at least a portion of their calamities, by involving them in the Peloponnesian war. An assembly of the people was held, in which Pericles entered upon a justification of his conduct, and exhorted them to courage and perseverance in defence of their independence. The hardships to which they had been exposed by the war, were, he observed, only such as he had in former addresses prepared them to expect; and as for the pestilence, it was a calamity which no human prudence could either have foreseen or averted. He reminded them that they still possessed a fleet which that of no potentate on earth could equal or cope with, and that, after the present evil should have passed away, their navy might yet enable them to acquire universal empire. 'What we suffer from the gods,' continued he, 'we should bear with patience; what from our enemies, with manly firmness; and such were the maxims of our forefathers. From unshaken fortitude in misfortune has arisen the present power of this commonwealth, together with that glory which, if our empire, according to the lot of all earthly things, decay, shall still survive to all posterity.'

The eloquent harangue of Pericles diminished, but did not remove, the alarm and irritation of the Athenians, and they not only dismissed him from all his offices, but imposed upon him a heavy fine. Meanwhile domestic afflictions were combining with political anxieties and mortifications to oppress the mind of this eminent man, for the members of his family were one by one perishing by the plague. Still, however, he bore himself up with a fortitude which was witnessed with admiration by all around him; but at the funeral of the last of his children, his firmness at length gave way; and while he was, according to the custom of the country, placing a garland of flowers on the head of the corpse, he burst into loud lamentations, and shed a torrent of tears. It was not long till his mutable countrymen repented of their harshness towards him, and reinvested him with his civil and military authority. He soon after followed his children to the grave, falling, like them, a victim to the prevailing pestilence (429 B.C.). The concurrent testimony of the ancient writers assigns to Pericles the first place among Grecian statesmen for wisdom and eloquence. Though ambitious of power, he was temperate in its exercise; and it is creditable to his memory, that, in an age and country so little scrupulous in the shedding of blood, his long administration was as merciful and mild as it was vigorous and effective. When constrained to make war, the constant study of this eminent statesman was, how to overcome his enemies with the least possible destruction of life, as well on their side as on his own. It is related that, when he was lying at the point of death, and while those who surrounded him were recounting his great actions, he suddenly interrupted them by expressing his surprise that they should bestow so much praise on achievements in which he had been rivalled by many others, while they omitted to mention what he considered his highest and peculiar honour—namely, *that no act of his had ever caused any Athenian to put on mourning.*

After the death of Pericles, the war was continued, without interruption, for seven years longer, but with no very decisive advantage to either side. During this period the Athenian councils were chiefly directed by a coarse-minded and unprincipled demagogue named Cleon, who was at last killed in battle under the walls of Amphipolis, a Macedonian city, of which the possession was disputed by the Athenians and Lacedaemonians.

Cleon was succeeded in the direction of public affairs by Nicias, the leader of the aristocratical party, a man of virtuous but unenterprising character, and a military officer of moderate abilities. Under his auspices a peace for fifty years, commonly known by the name of the 'Peace of Nicias,' was concluded in the tenth year of the war (421 B.C.). It was not long, however, till the contest was resumed. Offended that its allies had given up a contest undertaken for the assertion of its alleged rights, Corinth refused to be a party to the treaty of peace, and entered into a new quadruple alliance with Argos, Elis, and Mantinea, a city of Arcadia; the ostensible object of which confederation was the defence of the Peloponnesian states against the aggressions of Athens and Sparta. This end seemed not difficult of attainment, as fresh distrusts had arisen between the two last-mentioned republics, on account of the reluctance felt and manifested by both to give up certain places which they had bound themselves by treaty mutually to surrender. The jealousies thus excited were fanned into a violent flame by the artful measures of Alcibiades, a young Athenian, who now began to rise into political power, and whose genius and character subsequently exercised a strong influence upon the affairs of Athens.

#### Alcibiades.

Alcibiades was the son of Clinias, an Athenian of high rank. Endowed with uncommon beauty of person, and talents of the very highest order, he was unfortunately deficient in that unbending integrity which is an essential element of every character truly great, and his violent passions sometimes impelled him to act in a manner which has brought disgrace on his memory. While still very young, Alcibiades served in the Athenian army, and became the companion and pupil of Socrates, one of the wisest and most virtuous of the Grecian sages. Having rendered some service to his country in a protracted and useless war with Lacedaemon, and being possessed of a talent for addressing the passions of the multitude, Alcibiades, as others had done before him, became the undisputed head of public affairs in Athens. But this pre-eminence was not of long continuance. An opinion arose among the people that he designed to subvert the constitution, and his fall was as quick as his promotion. Many of his friends were put to death, and he, while absent on an expedition, deprived of his authority. Being thus left without a public director of affairs, Athens, as usual, was torn by internal discords: the aristocratic faction succeeded in overthrowing the democratical government (411 B.C.), and establishing a council of 400 individuals to administer the affairs of the state, with the power of convoking an assembly of 5000 of the principal citizens for advice and assistance in any emergency. These 400 tyrants, as they were popularly called, were no sooner invested with authority, than they annihilated every remaining portion of the free institutions of Athens. They behaved with the greatest insolence and severity towards the people, and endeavoured to confirm and perpetuate their usurped power, by raising a body of mercenary troops in the islands of the *Ægean*, for the purpose of overawing and enslaving their fellow-citizens. The Athenian army was at this period in the island of Samos, whither it had retired after an expedition against the revolted cities of Asia Minor. When intelligence arrived of the revolution in Athens, and the tyrannical proceedings of the oligarchical faction, the soldiers indignantly refused to obey the new government, and sent an invitation to Alcibiades to return among them, and assist in re-establishing the democratical constitution. He obeyed the call; and as soon as he arrived in Samos, the troops elected him their general. He then sent a message to Athens, commanding the 400 tyrants to divest themselves immediately of their unconstitutional authority, if they wished to avoid deposition and death at his hands.

This message reached Athens at a time of the greatest confusion and alarm. The 400 tyrants had quarrelled among themselves, and were about to appeal to the

sword: the island of Eubœa, from which Athens had for sometime been principally supplied with provisions, had revolted, and the fleet which had been sent to reduce it had been destroyed by the Lacedæmonians, so that the coasts of Attica, and the port of Athens itself, were now without defence. In these distressing circumstances, the people, roused to desperation, rose upon their oppressors, overturned the government of the 400, after an existence of only a few months, and re-established their ancient institutions. Alcibiades was now recalled; but before revisiting Athens, he was desirous of performing some brilliant military exploit, which might obliterate the recollection of his late connection with the Spartans, and give his return an air of triumph. He accordingly joined the Athenian fleet, then stationed at the entrance of the Hellespont, and soon obtained several important victories over the Lacedæmonians, both by sea and land. He then returned to Athens, where he was received with transports of joy. Chaplets of flowers were showered upon his head, and amidst the most enthusiastic acclamations he proceeded to the place of assembly, where he addressed the people in a speech of such eloquence and power, that at its conclusion a crown of gold was placed upon his brow, and he was invested with the supreme command of the Athenian forces, both naval and military. His forfeited property was restored, and the priests were directed to revoke the curses which had formerly been pronounced upon him.

This popularity of Alcibiades was not of long continuance. Many of the dependencies of Athens being in a state of insurrection, he assumed the command of an armament intended for their reduction. But circumstances arose which obliged him to leave the fleet for a short time in charge of one of his officers, named Antiochus, who, in despite of express orders to the contrary, gave battle to the Lacedæmonians during the absence of the commander-in-chief, and was defeated. When intelligence of this action reached Athens, a violent clamour was raised against Alcibiades: he was accused of having neglected his duty, and received a second dismissal from all his offices. On hearing of this, he quitted the fleet, and retiring to a fortress he had built in the Chersonesus of Thrace, he collected around him a band of military adventurers, with whose assistance he carried on a predatory warfare against the neighbouring Thracian tribes.

Alcibiades did not long survive his second disgrace with his countrymen. Finding his Thracian residence insecure, on account of the increasing power of his Lacedæmonian enemies, he crossed the Hellespont, and settled in Bithynia, a country on the Asiatic side of the Propontis. Being there attacked and plundered by the Thracians, he proceeded into Phrygia, and placed himself under the protection of Pharnabazus, the Persian satrap of that province. But even thither the unfortunate chief was followed by the unrelenting hatred of the Lacedæmonians, by whose directions he was privately and foully assassinated. Thus perished, about the fortieth year of his age (403 B.C.), one of the ablest men that Greece ever produced. Distinguished alike as a warrior, an orator, and a statesman, and in his nature noble and generous, Alcibiades would have been truly worthy of our admiration if he had possessed probity; but his want of principle, and his unruly passions, led him to commit many grievous errors, which contributed not a little to produce or aggravate those calamities which latterly overtook him.

#### DECLINE OF ATHENIAN INDEPENDENCE.

With Alcibiades perished the last of the great men who possessed the power to sway the wild democracy, or, properly speaking, the mob of Athens. From the period of his death till the subjugation of the country, the Athenian people were at the mercy of contending factions, and without a single settled principle of government. During this brief period of their history, in which a kind of popular democracy had attained the command of affairs, happened the trial and condemna-

tion of Socrates, an eminent teacher of morals, and a man guiltless of every offence but that of disgracing, by his illustrious merit, the vices and follies of his contemporaries. On the false charge of corrupting the morals of the pupils who listened to his admirable expositions, and of denying the religion of his country, he was, to the eternal disgrace of the Athenians, compelled to die by drinking poison, a fate which he submitted to with a magnanimity which has rendered his name for ever celebrated. This odious transaction occurred in the year 400 B.C.

After the death of this great man, the political independence of Athens drew to its termination—a circumstance which cannot excite the least surprise, when we reflect on the turbulence of its citizens, their persecution of virtue and talent, and their unhappy distrust of any settled form of government. Their ruin was finally accomplished by their uncontrollable thirst for war, and can create no emotions of pity or regret in the reader of their distracted history. The Lacedæmonians, under the command of an able officer named Lysander, attacked and totally destroyed the Athenian fleet. By this means having obtained the undisputed command of the sea, Lysander easily reduced those cities on the coasts of Thrace and Asia Minor, and those islands of the Ægean, which still acknowledged the supremacy of Athens. Having thus stripped that once lordly state of all its dependencies, he proceeded to blockade the city of Athens itself. The Athenians made a heroic defence; but after a lengthened siege, during which they suffered all the horrors of famine, they were obliged to surrender on such conditions as their enemies thought fit to impose (404 B.C.). The Spartans demanded that the fortifications of Piræus, and the long walls which connected it with the city, should be demolished; that the Athenians should relinquish all pretensions to authority over their former tributaries, recall the exiled partisans of the 400 tyrants, acknowledge the supremacy of Sparta, and follow its commanders in time of war; and finally, that they should adopt such a political constitution as should meet the approbation of the Lacedæmonians.

Thus sank the power of Athens, which had so long been the leading state of Greece, and thus terminated the Peloponnesian war, in which the Grecian communities had been so long engaged, to little other purpose than to waste the strength, and exhaust the resources, of their common country.

#### Condition of Athens.

During the age preceding its fall, Athens, as already mentioned, had been greatly beautified and enlarged by Pericles. At the same time, the comparative simplicity of manners which formerly prevailed was exchanged for luxurious habits. This alteration has been thus described by Gillies in his 'History of Ancient Greece':—'In the course of a few years, the success of Aristides, Cimon, and Pericles, had tripled the revenues, and increased in a far greater proportion the dominions of the republic. The Athenian galleys commanded the eastern coasts of the Mediterranean; their merchantmen had engrossed the traffic of the adjacent countries; the magazines of Athens abounded with wood, metal, ebony, ivory, and all the materials of the useful as well as of the agreeable arts; they imported the luxuries of Italy, Sicily, Cyprus, Lydia, Pontus, and Peloponnesus; experience had improved their skill in working the silver mines of Mount Laurium; they had lately opened the valuable marble veins in Mount Pentelicus; the honey of Hymettus became important in domestic use and foreign traffic; the culture of their olives (oil being long their staple commodity, and the only production of Attica which Solon allowed them to export) must have improved with the general improvement of the country in arts and agriculture, especially under the active administration of Pericles, who liberally let loose the public treasure to encourage every species of industry.

But if that minister promoted the love of action, he found it necessary at least to comply with, if not to ex-

## HISTORY OF GREECE.

cite the extreme passion for pleasure which then began to distinguish his countrymen. The people of Athens, successful in every enterprise against their foreign as well as domestic enemies, seemed entitled to reap the fruits of their dangers and victories. For the space of at least twelve years preceding the war of Peloponnesus, their city afforded a perpetual scene of triumph and festivity. Dramatic entertainments, to which they were passionately addicted, were no longer performed in slight, unadorned edifices, but in stone or marble theatres, erected at great expense, and embellished with the most precious productions of nature and of art. The treasury was opened, not only to supply the decorations of this favourite amusement, but to enable the poorer citizens to enjoy it, without incurring any private expense; and thus, at the cost of the state, or rather of its tributary allies and colonies, to feast and delight their ears and fancy with the combined charms of music and poetry. The pleasure of the eye was peculiarly consulted and gratified in the architecture of theatres and other ornamental buildings; for as Themistocles had strengthened, Pericles adorned, his native city; and unless the concurring testimony of antiquity was illustrated in the Parthenon, or Temple of Minerva, and other existing remains worthy to be immortal, it would be difficult to believe that in the space of a few years there could have been created those numerous, yet inestimable wonders of art, those temples, theatres, statues, altars, baths, gymnasia, and porticoes, which, in the language of ancient panegyric, rendered Athens the eye and light of Greece.

Pericles was blamed for thus decking one favourite city, like a vain voluptuous harlot, at the expense of plundered provinces; but it would have been fortunate for the Athenians if their extorted wealth had not been employed in more perishing, as well as more criminal, luxury. The pomp of religious solemnities, which were twice as numerous and costly in Athens as in any other city of Greece—the extravagance of entertainments and banquets, which on such occasions always followed the sacrifices—the increase of private luxury, which naturally accompanied this public profusion—exhausted the resources, without augmenting the glory, of the republic. Instead of the bread, herbs, and simple fare recommended by the laws of Solon, the Athenians, soon after the eightieth Olympiad, availed themselves of their extensive commerce to import the delicacies of distant countries, which were prepared with all the refinements of cookery. The wines of Cyprus were cooled with snow in summer; in winter, the most delightful flowers adorned the tables and persons of the wealthy Athenians. Nor was it sufficient to be crowned with roses, unless they were likewise anointed with the most precious perfumes. Parasites, dancers, and buffoons, were a usual appendage of every entertainment. Among the weaker sex, the passion for delicate birds, distinguished by their voice or plumage, was carried to such excess, as merited the name of madness. The bodies of such youths as were not peculiarly addicted to hunting and horses, which began to be a prevailing taste, were corrupted by a lewd style of living; while their minds were still more polluted by the licentious philosophy of the sophists. It is unnecessary to crowd the picture, since it may be observed, in one word, that the vices and extravagances which are supposed to characterise the declining ages of Greece and Rome, took root in Athens during the administration of Pericles, the most splendid and most prosperous in the Grecian annals.

During this period flourished Æschylus and Sophocles, Euripides and Aristophanes, dramatists; Pindar, a lyrical poet; Herodotus and Thucydides, historians; Xenophanes, Heraclitus, Empedocles, Anaxagoras, and Socrates, philosophers (reasoners upon the nature of the human mind, and upon man's immortal destiny). In this period also, under the administration of Pericles (from 458 to 429 B. C.), sculpture and architecture attained their perfection. It was then that Phidias executed those splendid works, statues of the gods and goddesses, which excited the admiration of the world,

and which succeeding artists have in vain endeavoured to rival. While Athens had extended its power over a great part of the coasts of the Ægean Sea, and increased its trade and commerce by every available means, it had also become a city of palaces and temples, whose ruins continue to be the admiration of ages for their grandeur and beauty. It is understood that the Greeks had acquired their knowledge of architecture from the Egyptians; but they greatly excelled them in the elegance of their designs, and are in a great measure entitled to the character of inventors in the art. The beauty of the Corinthian pillar, for example, has never been excelled either in ancient or modern times. (See ARCHITECTURE, in Vol. I.)

After the surrender of Athens to the Spartans (404 B. C.), the democratical constitution was abolished, and the government was intrusted to thirty persons, whose rapacious, oppressive, and bloody administration ere long procured them the title of the Thirty Tyrants. The ascendancy of these intruders was not, however, of long duration. Conon, assisted privately by the Persians, who were desirous of humiliating the Spartans, expelled the enemy, and re-established the independence of his country. About seventy years later, a new source of agitation throughout Greece was caused by the warlike projects of Alexander, king of Macedon, usually styled

### Alexander the Great.

This intrepid and ambitious soldier was the son of Philip, king of Macedon, a small territory adjacent to the Grecian states, from which it had originally received a knowledge of arts and learning. Alexander was born in the year 356 B. C., and by his father was committed to the charge of the philosopher Aristotle to be educated; a duty which was faithfully fulfilled. By the assassination of Philip, Alexander was called to the throne of Macedon while yet only twenty years of age, and immediately had an opportunity of displaying his great warlike abilities in conducting an expedition into Greece, which was attended with signal success, and procured for him the honour of succeeding his father as commander-in-chief of the Grecian states. He now carried out a design which had been formed by Philip, to subdue Persia and other countries in Asia. In the spring of 334 B. C., he crossed over to the Asiatic coast, with an army of 30,000 foot and 5000 horse, thus commencing the most important military enterprise which is narrated in the pages of ancient history. Alexander marched through Asia Minor, and in successive encounters completely conquered the armies of Persia; but the whole history of his progress is but an account of splendid victories. During a space of about seven or eight years, he conquered Persia, Assyria, Egypt, Babylonia, and, in fact, became master of nearly all the half-civilised countries in Asia and Africa. It does not appear that Alexander had any motive for this wide-spread overthrow of ancient and remote sovereignties, excepting that of simple ambition, or desire of conquest, with perhaps the indefinite idea of improving the social condition of the countries which he overran. From various circumstances in his career, it is apparent that he never contemplated the acquisition of wealth or of praise, except such as could be shared with his soldiers, for whom he displayed a most paternal affection. His character in this respect shines forth in a remarkable speech which he delivered to his army after these great conquests, and when some mutinous murmurs had broken forth in his camp. Mounting the tribunal, he spoke as follows:—'It is not my wish, Macedonians, to change your resolution. Return home without hindrance from me. But before leaving the camp, first learn to know your king and yourselves. My father Philip (for with him it is ever fit to begin) found you, at his arrival in Macedon, miserable and hopeless fugitives; covered with skins of sheep; feeding among the mountains some wretched herds, which you had neither strength nor courage to defend against the Thracians, Illyrians, and Triballi.

Having repelled the ravagers of your country, he brought you from the mountains to the plain, and taught you to confide, not in your fastnesses, but in your valour. By his wisdom and discipline, he trained you to arts and civility, enriched you with mines of gold, instructed you in navigation and commerce, and rendered you a terror to those nations at whose names you used to tremble. Need I mention his conquests in Upper Thrace, or those, still more valuable, in the maritime provinces of that country? Having opened the gates of Greece, he chastised the Phœnicians, reduced the Thessalians, and while I shared the command, defeated and humbled the Athenians and Thebans, eternal foes to Macedon, to whom you had been successively tributaries, subjects, and slaves. But my father rendered you their masters; and having entered the Peloponnesus, and regulated at discretion the affairs of that peninsula, he was appointed, by universal consent, general of combined Greece; an appointment not more honourable to himself than glorious for his country. At my accession to the throne, I found a debt of 500 talents, and scarcely sixty in the treasury. I contracted a fresh debt of 800; and conducting you from Macedon, whose boundaries seemed unworthy to confine you, safely crossed the Hellespont, though the Persians then commanded the sea. By one victory we gained Ionia, Æolia, both Phrygia, and Lydia. By our courage and activity, the provinces of Cilicia and Syria, the strength of Palestine, the antiquity of Egypt, and the renown of Persia, were added to your empire. Yours now are Bactria and Aria, the productions of India, the fertility of Assyria, the wealth of Susa, and the wonders of Babylon. You are generals, princes, satraps. What have I reserved for myself but this purple and diadem, which mark my pre-eminence in toil and dangers! Where are my private treasures! Or why should I collect them! Are my pleasures expensive! You know that I fare worse than any of yourselves; and have in nothing spared my person. Let him who dares compare with me. Let him bare his breast, and I will bare mine. My body, the fore part of my body, is covered with honourable wounds from every sort of weapon. I often watch, that you may repose safely; and to testify my unremitting attention to your happiness, had determined to send home the aged and infirm among you, loaded with wealth and honour. But since you are all desirous to leave me, go! Report to your countrymen that, unmindful of the signal bounty of your king, you intrusted him to the vanquished barbarians. The report, doubtless, will bespeak your gratitude and piety.

This impassioned and touching oration deeply affected the discontented soldiers, and all gladly returned to their allegiance. Shortly after this, the extraordinary career of Alexander was suddenly cut short by death. At Babylon, while engaged in extensive plans for the future, he became sick, and died in a few days, 323 B. C. Such was the end of this conqueror, in his thirty-second year, after a reign of twelve years and eight months. He left behind him an immense empire, which, possessing no consolidated power, and only loosely united by conquest, became the scene of continual wars. The generals of the Macedonian army respectively seized upon different portions of the empire, each trusting in his sword for an independent establishment. The greedy struggle for power finally terminated in confirming Ptolemy in the possession of Egypt; Seleucus in Upper Asia; Cassander in Macedon and Greece; while several of the provinces in Lower Asia fell to the share of Lysimachus.

CONCLUDING PERIOD OF GREEK HISTORY.

At the death of Alexander, the Athenians considered it a fit opportunity to emancipate themselves from the ascendancy of Macedon; but without success. Demosthenes, one of the most eminent patriots and orators of Athens, on this occasion, to avoid being assassinated by order of Antipater, the Macedonian viceroy, killed himself by swallowing poison; and his compatriot

Phocion was shortly afterwards put to death by his own countrymen, the Athenians, in a mad outbreak of popular fury. Greece cannot be said to have produced one great man after Phocion; and this deficiency of wise and able leaders was doubtless one chief cause of the insignificance into which the various states, great and small, sunk after this epoch.

The ancient history of Greece, as an independent country, now draws to a close. Achaia, hitherto a small, unimportant state, having begun to make some pretensions to political consequence, excited the enmity of Sparta, and was compelled to seek the protection of Philip, the ruling prince of Macedon. Philip took the field against the Spartans, and their allies the Ætolians, and was in a fair way of subjecting all Greece by arms and influence, when he ventured on the fatal step of commencing hostilities against the Romans. This measure consummated the ruin of Greece, as well as that of Macedon. The Romans warred with Philip till the end of his life (175 B. C.), and continued the contest with his son Perseus, whom they utterly defeated, and with whom ended the line of the kings of Macedon. In a few years the once illustrious and free republics of Greece were converted into a Roman province, under the name of Achaia (146 B. C.).

Thus terminates the fourth and last period of Greek history, during which there flourished several eminent writers and philosophers, among whom may be numbered Theocritus, a pastoral poet; Xenophon, Polybius, Diodorus Siculus, Dionysius Halicarnassus, Plutarch, and Herodian, historians; Demosthenes, an orator; and Plato, Aristotle, Zenó, and Epicurus, philosophers; also Zeuxis, Timanthes, Pamphilus, Nicias, Apelles, and Eupompus, painters; and Praxiteles, Polycletus, Camachus, Naucides, and Lysippus, sculptors.

In the condition of a humble dependency of Rome, and therefore following the fate of that empire, Greece remained for upwards of four succeeding centuries; but although of little political importance, it still retained its pre-eminence in learning. Enslaved as the land was, it continued to be the great school of the time. As Greece had formerly sent its knowledge and arts over the East by the arms of one of her own kings, she now diffused them over the western world under the protection of Rome. Athens, which was the emporium of Grecian learning and elegance, became the resort of all who were ambitious of excelling either in knowledge or the arts; statesmen went thither to improve themselves in eloquence; philosophers to learn the tenets of the sages of Greece; and artists to study models of excellence in building, statuary, or painting; natives of Greece were also found in all parts of the world, gaining an honourable subsistence by the superior knowledge of their country. That country in the meantime was less disturbed by intestine feuds than formerly, but was not exempt from the usual fate of conquests, being subject to the continual extortions of governors and lieutenants, who made the conquered provinces the means of repairing fortunes which had been broken by flattering the caprices of the populace at home.

The period of the independence of Greece, during which all those great deeds were performed which have attracted the attention of the world, may be reckoned from the era of the first Persian war to the conquest of Macedon, the last independent Greek state, by the Romans. This period, as we have seen, embraced little more than 300 years. It is not, therefore, from the duration of the independent political power of the Grecian states that their celebrity arises. Even the patriotism of their soldiers, and the devoted heroism of Thermopylæ and Marathon, have been emulated elsewhere without attracting much regard; and we must therefore conclude that it is chiefly from the superiority of its poets, philosophers, historians, and artists, that the importance of the country in the eyes of modern men arises. The political squabbles of the Athenians are forgotten; but the moral and intellectual researches of their philosophers, and the elegant remains of their artists, possess an undying fame.

# HISTORY OF ROME.

ABOUT the year 754 B.C., at that point of Central Italy, nearly fifteen miles from the Tuscan Sea, where the Anio joins the Tiber, there stood on a height, called the Palatine Mount, a little village named *Roma*, the centre of a small township, consisting probably of 5000 or 6000 inhabitants, all of them husbandmen and shepherds. This Rome was one of the border townships of Latium, a territory of fertile and undulating table-land extending from the Tiber to the Liris, and from the sea-coast to the hills of the interior. The whole surface of Latium was under diligent cultivation, and was covered with villages similar to Rome, which together constituted what was called the Latin nation.

## EARLY INHABITANTS OF ITALY—THE LATIN—PRIMITIVE ROMAN SOCIETY.

The population of Latium consisted of a mixture of Oscans, who are supposed to have been the aboriginal inhabitants of this as of other parts of Italy, with Pelasgians, an invading race, who, obeying the tendency of the human species in early times to move westward, had poured themselves out of Asia into the south-eastern parts of Europe, and after filling Greece, had sought settlements on the Italian coasts. The language of the Latins, accordingly, was a compound of Pelasgic (which was also the radical element of the Greek) with Oscan, the aboriginal tongue of the district, and which still lingered among the mountaineers of the Apennines. It was a tradition among the Latins themselves, that their nation had been founded, or at least re-organised, by Æneas, one of the mythic heroes of the 'Iliad,' who, on the destruction of his native city Troy, had sought refuge in Italy. The progeny of this hero, it was believed, still reigned over Alba Longa, the chief of all the Latin cities, and the capital of the nation. The general affairs of the community were administered by a confederacy of thirty of the principal townships. As regarded its own special government, however, each township, powerful enough to resist encroachment, was independent. The government in all these petty states or townships, Rome among the rest, was of the primitive heroic model: a king or chieftain, of high lineage, presided over the community, governing by divine right, but in accordance with certain time-hallowed customs, one of which was, that of assembling the people for consultation on

great emergencies. Social order within the limits of each little state was further secured by the natural arrangement into families—the authority of the head of a family in primitive society amounting even to the power of life and death over all members of that family. Besides the division into families, however, there existed in the ancient states of Italy and Greece another natural division, of a kind of which we have no exact type in modern times—that into *Gentes*, or, as it may with some license be translated, *Houses*. The gens, or house, was an association of families—ten, twelve, or twenty families to a gens: the connecting ties being descent from a common ancestor, or at least belief in such a descent; the obligation at stated times to perform certain sacrifices and religious rites in common; and certain legal advantages which the association procured for its members—such as the right of the gens to succeed to the property of any of its members who might die intestate, and without direct heirs. Each gens had its head or chief; and the heads or chiefs of the gentes in any community constituted a sort of natural senate, or assembly of aged and experienced persons, whom the king could consult as an intermediate body between himself and the entire *Populus*, or People. Thus in Rome, the constitution of which, about the year B.C. 754, seems to have attained a pretty fixed shape, the heads of the hundred gentes into which, according to the traditional system of round numbers, the little community was divided, constituted a senate or assembly of elders, acting as advisers of the king, and generally as the chief men of the state. Honest gray-haired old farmers we may suppose these primitive Roman senators to have been, with firm faith, nevertheless, that in their veins flowed the blood of heroes and demigods of the olden time, the duty of remembering whom formed part of their household religion. The gens of the Fabii, for instance, traced themselves up to an imaginary hero, named Fabius; the gens of the Nautii to an imaginary Nautius, strong-limbed, and powerful in battle.

Rome, we have said, was a frontier township of Latium. It was situated precisely at that point where the territories of Latium adjoined those of two other nations—of the Sabines, a hardy Oscan race of shepherds inhabiting the angular district between the Anio and the Tiber; and of the Etruscans, a remarkable people, of unknown but probably Oriental origin, who had arrived in the north of Italy some centuries later than the Pelasgians, and conquering all before them, whether Pelasgians or Oscans, by the force of superior civilisation, had settled chiefly in the region between the Arnus and the Tiber, corresponding to modern Tuscany. Between these three races—Oscans, Pelasgians, and Etruscans—either apart, or in various combinations, all Italy, with the exception perhaps of some portions near the Alps, was divided: the Oscans predominating in the interior; the Pelasgians, or rather Pelasgo-Oscans, along the coasts, as in Latium; and the Etruscans in the parts above-mentioned. While the Italian peninsula was thus occupied but by three great races or main stocks; the political divisions or nations into which it was parcelled out were so numerous, however, that it would be scarcely possible to give a complete list of them.

Situated so near to the Sabine and Etruscan frontiers, an intercourse, sometimes friendly and sometimes hostile, must naturally have been carried on between the Latins of Rome and the Sabines and Etruscans, with whom they were in contact. A chain of events, which history cannot now trace, but which is indicated in a poetic manner by a number of early Roman legends, led to the incorporation of Rome with two neigh-

houring towns—one of them a small dependency of the Etruscans, situated on the Caelian Hill, and probably named Lucerum; another a Sabine village on the Quirinal Hill, called Quirium. The Etruscans, or Etrusco-Latins as they seem rather to have been, of Lucerum were received on a subordinate footing; the Sabines of Quirium on one of equality; but the joint city continued to bear its old name of Roma. The population of this new Rome consisted, therefore, of three tribes—the ancient Romans, who called themselves *Ramnes*; the Sabines of Quirium, who called themselves *Tities*; and the Etrusco-Latins of Lucerum, who were named *Luceres*.

ORIGINAL ROMAN CONSTITUTION—EARLY HISTORY UNDER THE KINGS—ORIGIN OF THE PLEBEIANS.

With the enlargement of the population of Rome by the addition of these new masses of citizens, a change of the constitution became of course necessary. The following seems to have been the form ultimately assumed:—Governed by a common sovereign, eligible by the whole community from one of the superior tribes—the *Ramnes* and the *Tities*—the three tribes intrusted the conduct of their affairs to a senate composed of 200 members, 100 of whom represented the gentes of the *Ramnes*, and 100 the gentes of the *Tities*. The *Luceres*, as an inferior tribe, were not represented in the senate; and their political influence was limited to the right to vote with the other two tribes in the general assemblies of the whole people. In these general assemblies, or *Comitia*, as they were called, the people voted; not individually, nor in families, nor in gentes, but in divisions called *Curia* or *Curies*; the *Curia* being the tenth part of a tribe, and including, according to the ancient system of round numbers, ten gentes. Thus the entire *Populus Romanus*, or Roman people, of this primitive time consisted of thirty curies—ten curies of *Ramnes*, ten of *Tities*, and ten of *Luceres*: the ten curies of each tribe corresponding to 100 gentes, and the thirty curies together making up 300 gentes. As the *Luceres* were an inferior tribe, their gentes were called *Gentes Minores*, or *Lesser Houses*; while those of the *Ramnes* and *Tities* were called *Gentes Majoeres*, or *Greater Houses*. The assembly of the whole people was called the *Comitia Curiata*, or Meeting of Curies. After a measure had been matured by the king and senate, it was submitted to the whole people in their curies, who might accept or reject, but could not alter, what was thus proposed to them. An appeal was also open to the curies against any sentence of the king, or of the judges nominated by him in his capacity of supreme judiciary. The king, moreover, was the high priest of the nation in peace, as well as the commander-in-chief during war. The 300 gentes furnished each a horseman, so as to constitute a body of cavalry; the mass of the people forming the infantry. The right of assembling the senate lay with the king, who usually convened it three times a month.

Such was ancient Rome, as it appears to the historic eye endeavouring to penetrate the mists of the past, where at first all seems vague and wavering. The inquirer to whom we owe the power to conceive the condition of ancient Rome, so far as that depended on political institutions, was the celebrated German historian Niebuhr. Not so, however, did the Romans conceive their own early history. In all ancient communities, it was a habit of the popular imagination, nay, it was part of the popular religion, to trace the fortunes of the community to some divine or semi-divine founder; whose exploits, as well as those of his heroic successors, formed the subject of numerous sacred legends and ballads. Now, it was part of the Roman faith that their city had been founded at a point of time corresponding with B.C. 754, by twin brothers of miraculous birth, called *Romulus* and *Remus*, whose father was the war god *Mars*, and their mother a vestal virgin of the line of the Alban kings, the progeny of the great *Æneas*. *Romulus*, according to this legend, surviving his brother *Remus*, became the king of the village of shepherds

which he had founded on the Palatine; and it was in his reign that those events took place which terminated in the establishment of the triple community of the *Ramnes*, *Tities*, and *Luceres*. Setting out with *Romulus*, the Romans traced the history of their state through a series of legends relating to six kings, his successors, whose characters, and the lengths of their reigns, are all duly determined. Of this traditional succession of seven kings, extending over a period of 245 years (B.C. 754–509), history can recognise with certainty the existence of only the two or three latest. It is possible, however, to elicit out of the legends a glimmering of the actual history of the Roman state during these imaginary reigns.

Possessed, as all our information respecting the Romans in later times justifies us in supposing, of an unusual degree of that warlike instinct which was so rampant among the early tenants of our globe, the shepherd farmers of Rome were incessantly engaged in raids on their Latin, Etruscan, and Sabine neighbours. Strong-bodied, valiant, and persevering, as we also know them to have been, they were, on the whole, successful in these raids; and the consequence was, a gradual extension of their territory, particularly on the Latin side, by the conquest of those who were weaker than themselves. After each conquest, their custom was to deprive the conquered community of a part of their lands, and also of their political independence, annexing them as subjects to the *Populus Romanus*. The consequence was a gradual accumulation round the original *Populus*, with its 300 Houses, of a subject-population, free-born, and possessing property, but without political influence. This subject-population, the origin of which is dated by the legends from the reign of *Ancus Martius*, the fourth king from *Romulus*, received the name of the *Plebs*, a word which we translate 'common people,' but which it would be more correct, in reference to these very ancient times, to translate 'conquered people.' Besides the plebs, the Roman community received another ingredient in the persons called *Clients*; strangers, that is, most of them professing mechanical occupations, who, arriving in Rome, and not belonging to a gens, were obliged, in order to secure themselves against molestation, to attach themselves to some powerful citizen willing to protect them, and called by them *Patronus*, or *Patron*. About six centuries before Christ, therefore, the population of the growing township of Rome may be considered as having consisted of four classes—1st, The *populus*, or patricians, a governing class, consisting of a limited number of powerful families, holding themselves aloof from the rest of the community, not intermarrying with them, and gradually diminishing in consequence; 2d, The plebs, or plebeians, a large and continually-increasing subject-population, of the same mixed Etrusco-Sabine-Latin blood as the *populus*, but domineered over by them by right of conquest; 3d, The *clients*, a considerable class, chiefly occupied in handicraft professions in the town, while the *populus* and the plebs confined themselves to the more honourable occupation, as it was then esteemed, of agriculture; and 4th, The slaves, or *servi*, whether belonging to patricians, plebeians, or clients—a class who were valued along with the cattle.

The increasing numbers of the plebs, the result of fresh wars, and the value of their services to the community, entitled them to possess, and emboldened them to claim, some political consideration. Accordingly, in the reign of *Tarquinius Priscus*, the fifth of the legendary kings, and in whose reputed Etruscan lineage historians fancy that they can discern a time when Etruscan influence, if not Etruscan arms, reigned paramount in Rome, a modification of the original constitution took place. A number of the richest plebeian families were drafted into the *populus*, to supply the blanks caused by the dying out of many of the ancient gentes of the *Ramnes*, *Tities*, and *Luceres*; and at the same time the number of senators was increased to 300, by the admission of the *Luceres* to the same rights as

the other two tribes. Even this modification was insufficient; and in order to do justice to the claims of the plebs, Servius Tullius, the successor of Tarquinius, and who is gratefully celebrated in Roman history as 'the King of the Commons,' proposed and effected an entire renovation of the political system of the state. His first reform consisted in giving the plebs a regular internal organisation for its own purposes, by dividing it into thirty tribes or parishes—four for the town, and twenty-six for the country—each provided with an officer or tribe-convener called the Tribune, as well as with a detailed machinery of local government; and all permitted to assemble in a general meeting called the *Comitia Tributa*, to discuss matters purely affecting the plebs. But this was not all. To admit the plebs to a share in the general legislative power of the community, he instituted a third legislative body, called the *Comitia Centuriata*, in addition to the two—the senate and the *comitia curiata*—already existing. The *comitia centuriata* was an assembly of the whole free population of the Roman territory—patricians, plebeians, and clients—arranged, according to the amount of their taxable property, in five classes, which again were subdivided into 195 bodies, called *Centuries*, each century possessing a vote, but the centuries of the rich being much smaller than those of the poor, so as to secure a preponderance to wealth. The powers of the *comitia centuriata* were similar to those of the *comitia curiata* under the former system. They had the right to elect supreme magistrates, and to accept or reject a measure referred to them by the king and senate. The *comitia curiata*, however, still continued to be held; and a measure, even after it had passed the *comitia centuriata*, had still to be approved by the *curies* ere it could become a law. Notwithstanding this restriction, the constitution of Servius Tullius was a great concession to the popular spirit, as it virtually admitted every free individual within the Roman territory to a share in the government.

An attempt on the part of Tarquinius Superbus, the successor of Servius Tullius, to undo the reforms of his predecessor, and to establish what the ancients called a tyranny, or a government of individual will, led to the expulsion of him and his family, and to the abolition of the kingly form of government at Rome, B.C. 509, or in the year of the city 245. Instead of a king, two annual magistrates called Consuls were appointed, in whom were vested all the kingly functions, with the exception of the pontifical, for which special functionaries were created. Otherwise, the Servian constitution remained in full operation.

#### THE COMMONWEALTH TO THE GAULISH INVASION—STRUGGLE BETWEEN THE PATRICIANS AND PLEBEIANS.

After the expulsion of the kings, the little republic had to struggle through many difficulties arising from the attacks of the neighbouring nations, incited thereto by the Tarquinii. Ten of the twenty-six rural parishes were torn away in the contest—a loss equivalent to a full third part of the Roman territory. It would have required a prophetic eye to foresee that, of all the states into which Italy was then divided, this little struggling republic was to obtain the pre-eminence. One would have been disposed to promise the supremacy of the peninsula rather to the cultured and large-brained Etruscans, already masters of the north of Italy; to the hardy and valiant Samnites, who were fast overspreading the southern interior; or, most probably of all, to the Greeks, who, after adding Sicily to the empire of their gifted race, were rapidly establishing colonies on the southern coasts of the peninsula. Nay, clustered round the Roman territories there were various petty states, any one of which might have appeared a match for Rome—the Latins, the Æquians, the Volscians, the Hernicans, the Sabines, and the Etruscans of Veii on the right bank of the Tiber. Who could have predicted that, bursting this cincture of nations, the men of the Tiber would overspread the peninsula, and, by the leavening influence of their

character and institutions, throw first it, and then all Europe, into fermentation?

It required a period of 119 years (B.C. 509–390) to enable the Romans to burst the chain of petty nations—Latins, Volscians, Veientes, &c.—which girdled in their strength. This was a period of almost incessant warfare; the last glorious act of which was the siege and capture of Veii by the hero Camillus, B.C. 395, or in the year of the city 359. By this capture part of Etruria was added to the Roman dominions, and the influence of the state considerably extended on all sides. This conquest, as well as the career of victory against Æquians, Volscians, &c. which had preceded it, was greatly facilitated by a confederacy, offensive and defensive, which had subsisted between the Romans and the adjacent nations of the Latins and the Hernicans from the year of the city 268, the twenty-third year after the expulsion of the kings, when it had been established by the instrumentality of an able patrician named Spurius Cassius, who was three times, in cases of difficulty, elected to the consulship. This confederacy with two powerful nations had insured the stability of the infant republic against all assaults.

The second consulship of Spurius Cassius (year of Rome 261, or B.C. 493) had also been remarkable as the epoch of a formidable civic tumult—the first of that long series of struggles between the patricians and the plebeians which constitutes the most interesting portion of the annals of the early Commonwealth. Not long after the expulsion of the kings, the patrician gentes had begun to show a disposition to tamper with the Servian constitution, or at least to prevent the plebs from obtaining more power than they already possessed. The principal instrument by which they were able to cripple the energies of the plebs was the operation of the law of debt. In primitive Rome, as in other ancient states, an insolvent debtor was liable to be seized by his creditor, and kept in chains, or made to work as his slave. Now, such had been the distress of the first years of the republic, that multitudes of the plebeians, deprived, by the casualties of war, of their little properties, had been obliged, in order to preserve the lives of their families, to become debtors to the patricians, the exclusive proprietors of the state lands. Hundreds had, in consequence, fallen into a condition of slavery; and many more, fearing to offend their patrician creditors by opposing their designs, had become mere ciphers in the *comitia centuriata*. In short, the plebs, as a body, was disintegrated and disheartened. Some instances of oppression, more flagrant than ordinary, led to an outbreak, and a clamour for the abolition of all existing debts; and to enforce their demands, the plebeians adopted a method of agitation which seems singular enough to our modern conceptions: they, or at least such of them as were in arms for military service, retired in a mass from the city at a time when it was threatened with invasion, and encamped on a hill near, declaring they would starve sooner than live in such a place as Rome was. The government was thus reduced to a dead lock; Spurius Cassius was chosen consul by the patricians; and by his instrumentality an arrangement was come to, by which the demands of the commons were conceded, existing debts abolished, a treaty of mutual obligation for the future agreed to between the populus and the plebs as between two independent communities, and a new office instituted, under the title of the *Tribuneship of the Common People*, for the express purpose of protecting the interests of the plebs. The commons then returned to the city; two tribunes of the people were appointed; and their number was subsequently increased first to five, and afterwards to ten. No one could have foreseen how important this office would become.

Not content with alleviating the temporary distresses of the plebeians, Spurius Cassius wished permanently to ameliorate their condition; and accordingly, in his third consulship, in the year of the city 268, or B.C. 486, he boldly proposed and carried what was called an *Agrarian Law*. It is absolutely necessary that the

reader of Roman history should understand this term. According to the early Roman constitution, the lands acquired in war became the property of the whole *populus*, or body of patricians, in common. Portions of the conquered lands might be purchased from the state by rich persons; and in such cases the purchaser, whether patrician or plebeian, became absolute owner. Usually, however, the lands were not sold, but were annexed to the unallotted property already belonging to the *populus*. With regard to this state land, a very curious system prevailed. Any patrician (but none else) was allowed to occupy and cultivate as much of it as he chose, on condition of paying to the state a tithe of the annual produce if it were arable land, and a fifth if it were laid out in oliveyards or vineyards. The land thus occupied did not, by right of possession, become the property of the individual: he was liable to be turned out of it at the pleasure of the state—his landlord; and it was entirely at his own risk that he laid out capital in improving it. As, however, it rarely happened that an individual was ejected from land which he had thus occupied, large tracts of the state land were speedily occupied by enterprising patricians. Such being the plan of distribution, it is evident that in the state lands, occupied and unoccupied, the government possessed a constant fund upon which they could draw in cases of emergency. By selling portions of it, they could raise money; and by assigning portions of it to indigent families, they could permanently provide for them. Several times, it appears, this had been done in the case of indigent plebeian families; and the agrarian law of Spurius Cassius was simply a proposal that—a large accession to the state lands having just taken place—the government should seize the opportunity to provide for the distressed plebeians, by apportioning them small portions of these state lands. To the plebeians this proposal was exceedingly agreeable; not so, however, to the patricians, who possessed the right of occupying and farming as much of the public territory as they chose, but who lost that right from the moment that the land was apportioned by the state. The patricians, accordingly, resisted the proposal with all their might; and Spurius Cassius having carried it notwithstanding, they caused him to be impeached and put to death as soon as his consulship had expired.

After this event, the patricians renewed their efforts to suppress the plebs, proceeding so far as to transfer the right of electing the consuls from the centuries to the purely patrician body of the *curies*. The plebeians, however, behaved resolutely, asserting their rights through their tribunes, and by clamours in the *comitia tributa*, where none but plebeians had a right to take a part. In the year of the city 271, or B.C. 483, they regained the power of choosing one of the consuls; and in the year 283, or B.C. 471, they wrung from the patricians the right of electing their tribunes in their own *comitia tributa*, instead of the centuries, at the same time obtaining the right to discuss in the *comitia tributa* affairs affecting the whole Commonwealth. Other concessions followed; and at length, in the year 292, or B.C. 462, a tribune named Caius Terentilius Harsa was so bold as to propose a complete revision of the constitution in all its parts. It was not desirable, he said, that the old distinction between *populus* and plebs, which had originated in war, should be longer kept up; let, therefore, a revision of the whole body of the laws be undertaken, with a view to put the plebeians on a legal equality with the patricians, and let some more limited form of supreme magistracy be substituted for the consulship. After a protracted opposition, this proposal resulted, in the year 303, or B.C. 452, in the appointment of the famous *First Decemvirate*; a board of ten patricians, who were to revise the entire body of the laws, as well as the political machinery of the state, superseding in the meantime all other authority. The digest of Roman law prepared by these decemvirs became the foundation of all subsequent jurisprudence among the Romans;

the amendments which they effected on the old laws were favourable to the plebeians. The principal constitutional changes which they carried out were the incorporation of patricians and clients with the plebeian tribes; the investment of the centuries with the powers of an ultimate court of appeal; and the substitution of the decemviral office, of which they themselves were an example, for the consulship, five of the decemvirs to be plebeians. This last change, however, was of short duration; for the second decemvirate was brought to an end by its own depravity. Compelled, by a new accession of the commons, to abdicate, the decemvirs of 305 were succeeded by two popular consuls, under whose auspices several important privileges were obtained for the plebeians, the most important of which was a law conferring on a *plebiscitum*, or resolution of the tribes, the right to become law on receiving the sanction of the patricians, thus enabling the whole people to originate measures as well as the senate. In 310, the plebeians mustered courage to demand that one of the consuls should thenceforward be chosen from their order. To divert them from this, the patricians yielded to another demand—the repeal of the law prohibiting intermarriage between the two orders. The plebeians, however, still persisting in their demand regarding the consulship, the patricians, in 311, offered a compromise, which consisted in breaking down the supreme authority, hitherto concentrated in the consulship, into three offices—the Censorship, the *Questorship*, and the Military *Tribunate*—with consular powers. The *censors* were to be two in number, chosen for a period of five years, by the *curies* from among the patricians, subject to the approval of the centuries. The ostensible duty of the censors was the administration of the public revenues; but as they were intrusted with the task of determining the rank of every citizen, and of rating his taxable property, their power was, in reality, enormous. To watch over the moral conduct of the citizens, and to degrade such senators or knights as disgraced their order, were parts of their understood duty. The *questors*, two in number, were to keep the public accounts; they were likewise to be patricians, but were to be chosen by the centuries. Regarding the third office, the *military tribunate*, the plebeians were to have the option of this office, consisting of an indefinite number of persons of somewhat less dignity than the consuls, but to be chosen by the centuries from either order indiscriminately, or of consuls to be chosen, as before, from among the patricians only.

This compromise having been accepted, the period from 311 to 350 was one of incessant agitation on the part of the plebeians, of incessant opposition on the part of the patricians, of incessant shifting between the consulship and the military tribunate, according as the patricians or the plebeians were the stronger. On the whole, however, the plebeians gained ground. In 321, the active authority of the censors was limited to eighteen months out of the five years for which they were appointed. In 328, the tribes obtained the right of deliberating on questions of peace and war. In 334, the number of the questors was increased to four, to be chosen indiscriminately from either order. Lastly, in 350, or B.C. 404, the system of payment for military service became common. During these forty years the patricians had frequently had recourse to the expedient of appointing a *Dictator*, or supreme magistrate, with unlimited authority for six months. Such an appointment almost always proved a temporary check to the political advancement of the plebeians. In cases of difficulty also, arising from external danger, it was usual to appoint some able man dictator; and it was at such a juncture, in the year 359, that, determined to bring the siege of Veii to a close, the Romans appointed Camillus to this high office.

The siege of Veii having terminated so successfully, the Romans were prepared to resume their career of conquest without, and their political agitations within, when both the one and the other received a check from an unexpected quarter. Some cause, now unknown,

## HISTORY OF ROME.

had thrown the Gauls, or Celtic populations inhabiting the western portion of Central Europe, into commotion; and bursting from their native haunts, a mass of these savages crossed the Alps in quest of plunder and settlements, established a permanent abode in the country adjacent to the Po, and pushed their destructive way through almost the whole length of the peninsula. Rome suffered more severely than any other city. For several months (364-5, or a.c. 390-89) it was in the possession of the savages—its rightful inhabitants, routed in battle, having dispersed themselves for safety through the surrounding country. At length, however, the Gauls were bribed to return to their homes in the north, leaving Rome in ruins.

### GRADUAL CONQUEST OF THE PENINSULA—ITALY UNDER THE ROMAN RULE.

The invasion of the Gauls is a great notch in the line of the Roman annals. From this epoch to the time of the complete subjugation of the peninsula by the Romans (365-490, or b.c. 389-264) is a period of 125 years. Of this period, the first fifty years were spent in repairing the shattered Commonwealth. Her strength having been fairly renewed, the republic shook off all impediments, announced to Latins and Hernicans that she required their co-operation no longer, and boldly declared her resolution to conquer central Italy. The series of wars against Etruscans, Latins, Hernicans, Gauls, Volscians, and Samnites, sometimes singly, and sometimes in combination, by which she carried her resolution into effect, is usually known in Roman history by the general designation of 'the Samnite Wars' (412-463), the Samnites being the leaders in this onset of the nations on Rome, the issue of which was to determine whether Rome or Samnium should govern Italy. Extricating herself by her valour from this confused conflict of nations, Rome, about the year 463, found herself mistress of Central Italy—Samnites, Latins, &c. all her subjects. A consequence of the conduct of the Latins and Hernicans during these Samnite wars was, that the famous triple confederacy between these two nations and the Romans was brought to an end precisely when it had fully served its purpose, and when its longer continuance would have impeded the growth in Italy of that Roman unity which it had fostered. 'The Samnite Wars' were succeeded by a short but brisk war, designated in Roman history 'the War with Pyrrhus and the Greeks in Italy.' Pyrrhus was an able and enterprising Greek prince, whom the Greek towns of southern Italy—fearful of being overwhelmed by the conquering barbarians, as they called them, of the Tiber, before whom even the Samnites had given way—had invited over from his native kingdom of Epirus, that he might place himself at the head of a confederacy which they were forming against Rome. Full of enmity towards their conquerors, all the recently-subdued nations of Central and Northern Italy welcomed the arrival of Pyrrhus; and all southern Italy followed his standard. His enterprise, however, failed, notwithstanding several victories; and about the year a.c. 275, Pyrrhus having withdrawn from Italy, the confederacy against the Roman Commonwealth crumbled to pieces, and the whole peninsula lay at their mercy. Before describing the manner in which the peninsula, thus acquired, was laid out and governed by the Romans, it will be necessary to continue our narrative of the gradual development of the constitution within, during the period which had elapsed since the Gaulish invasion.

The situation of Rome after the Gaulish invasion was extremely similar to what it had been after the expulsion of the kings—the plebeians distressed, and many of them in slavery for debt, and the patricians disposed to tyrannise. As on the former occasion there had risen up, as the best friend of the plebs, the noble patrician Spurius Cassius, so on this occasion there appeared as their champion a prudent and brave plebeian, Caius Licinius Stolo, a tribune of the people. His measures were very similar to those of Spurius

Cassius—namely, a compromise on the subject of debts (not, however, an abolition of them); and an agrarian law, prohibiting any citizen from occupying more than five hundred jugera (about 330 acres) of the public land, and depriving all who exceeded that quantity of the surplus for distribution among the indigent commons. To these he added a proposal for constitutional reform—namely, that the military tribunate should be abolished, and that the consulship should be reverted to, one of the consuls to be of necessity a plebeian. After a hard struggle, these important measures were carried in the year of the city 364, nineteen years after the Gaulish invasion. Under these Licinian Laws, as they were called, the state enjoyed tolerable repose for a long period of years—the principal source of disturbance being the attempts of the wealthy citizens to evade the operation of the agrarian law. The next great movement was in the year of the city 416, when, under the auspices of a plebeian dictator (for the dictatorship had also been thrown open to the plebeians), a considerable simplification of the constitution was effected. It was now rendered essential that one of the censors should be a plebeian; and the old patrician body of the curies was struck out of the machinery of the legislature, so as to leave the business of the state in the hands of the senate (itself become partly a plebeian body) and the people. Met in their centuries, the people could only accept or reject the measures proposed by the senate; but met in their tribes, they could originate a measure, and oblige the senate to consider it. Thus sometimes in the shape of a matured scheme descending from the senate to the people, sometimes in the shape of a popular resolution sent up to the senate, a measure became law. From this simplification of the constitution commences, according to historians, the golden age of Roman politics. The extension of dominion in the Samnite wars, by providing a large subject-population inferior both to patricians and plebeians, disposed these bodies to forget their differences, and to fall back upon their common consciousness of Roman citizenship. During the Samnite wars, however, a third party appeared in the field claiming political rights. These were the *Arriarii*, the name applied to all those residents in turn pursuing mechanical occupations, who, as not belonging to any of the tribes (now thirty-three in number), did not rank as citizens. The claims of this class—the city rabble, as both patricians and plebeians called it—were supported by a daring and able patrician, Appius Claudius, who, during his censorship, admitted arriarians into all the tribes indiscriminately. Eventually, however, a compromise was effected: the arriarians were enrolled in the four city tribes, thus obtaining some influence, but not so much as Appius seemed to desire for them. It appears to have been at some period also during the Samnite wars that a modification took place in the constitution of the *comitia centuriata*, the leading feature of which seems to have been a blending of the tribes with the centuries, so as to accommodate the assembly to the altered state of society and the altered scale of wealth. Of the precise nature of this change, however, as of the precise time at which it occurred, we are ignorant. It may be considered, nevertheless, to have perfected the Roman constitution, and to have adapted it for the function of maintaining the government of the entire peninsula.

Italy, once fairly subjugated and laid out by the Romans (a.c. 266), its population may be considered as having been distributed into three political divisions—the *Populus Romanus*, or citizens of Rome, properly so called; the *Socii*, or inhabitants of the allied and dependent Italian states; and the *Nomen Latinum*, or citizens of the 'Latin name.'

The first of these, the *Populus Romanus*, included the whole body of the free inhabitants of the thirty-three tribes or parishes north and south of the Tiber, which constituted the Roman territory strictly so called, together with a considerable number of persons scattered over the other parts of Italy, who were also accounted

citizens, either because they were colonists of Roman descent, or because the title had been conferred on them as an honorary distinction. The total number of adult Roman citizens towards the end of the fifth century was under 300,000—a small proportion, evidently, of the vast Italian mass, which consisted, including the slaves, of about 5,000,000. Nor were all these equal in point of civil rights, many of them having the *franchise*, as it was called, or legal rights of citizens, without the *suffrage*, or political rights. The citizens with suffrage, those who voted on public questions—the real governing power, therefore, by whose impulses all Italy, with its millions of inhabitants, was swayed, as the body is moved by the beats of the heart—were a mere handful of men, such as might be assembled with ease in any public park or square.

The Italian subjects were the inhabitants of the allied or dependent states. The list of these was a long one, including, as it did, the various communities which made up the populations of Etruria, Umbria, the Sabine territory, Samnium, Campania, Apulia, Lucania, Messapia, and Bruttium. All the allies, however, were not equally subject to Rome: the relations in which they stood to it were determined by the particular treaties which formed the separate alliances, and these, of course, varied according to the circumstances under which they had been concluded. Almost all the allied states, however, were permitted to retain their own laws, their own municipal arrangements, their own judges, &c. Throughout the peninsula, however, care was taken to destroy every vestige of nationality or a national legislature among the allies of the same race. Upon the whole, this change from independence to subjection to Rome was beneficial to the Italian nations. Not the least benefit attending it was the total abolition of those wars between neighbouring states which, while the peninsula was subdivided into small independent territories, had raged incessantly and fiercely.

The Nomen Latinum, or Latin name, was a fictitious designation applied to a number of colonies scattered through the peninsula, and which, in respect of privileges, stood in an intermediate position between the Roman citizens and the Italians. The name probably originated in the circumstance, that the original colonists of this description were Latins.

It is a curious fact, that even after Rome had attained the supremacy of the peninsula, there did not exist such a thing as even a dawning Roman literature, although the state had now existed nearly five hundred years; so much earlier than their literary faculty did the native talent of the Romans for governing mankind develop itself. It was by their massive character, more than by their powers of speculation or expression, that they were to impress the world.

#### THE PUNIC WARS—SUBJUGATION OF FOREIGN NATIONS—ADMINISTRATION OF THE PROVINCES.

Masters of Italy, it was not long before the Romans found themselves in collision with the nations surrounding the great basin of the Mediterranean; and as the last 125 years of the existence of the Roman state had been spent in the gradual conquest of the Italic nations, so the next 130 years (r. a. 490–620, or b. c. 264–134) were spent in a series of conquests, by which various foreign countries were reduced to the condition of mere provinces of Italy. This series of conquests may be designated generally by the title of 'the Punic Wars, and the Wars with the Greek States.' A bare enumeration of them, with a statement of their results, is all that our limits will allow.

The first foreign people with which the Romans came into collision were the Carthaginians—a people of Phœnician lineage, who, settling in that part of Africa now called Tunis, and building a city there, about a century before Rome was founded, had in the interval become a great commercial nation, with ships sailing to all parts of the Mediterranean, and with colonies along the coasts of Algiers, in Sardinia and Corsica, and even in Spain. They had recently gained

a footing in Sicily, and now shared it with the Greeks of Syracuse; and it was on this rich island as a battlefield that the Romans first came into conflict with the merchant people of Africa. Invited over by the Mamertines, a robber people who inhabited the north-eastern corner of the island, the Roman soldiers fought the armies of mercenaries hired by the Carthaginians. The war thus begun, the 'First Punic War,' as it is called, lasted twenty-three years (r. a. 490–513, or b. c. 264–241). During it the Romans first learned to build ships of war, and to fight naval battles; and they were soon able to defeat the Carthaginians on their own element. On land they were sure of victory against mere mercenaries, collected, as these were, from all nations, and commanded by Carthaginian generals of ordinary capacity. In 249 b. c., however, the Carthaginians sent over the great Hamilcar Barca to command their forces in Sicily; and his efforts checked the Romans, who, meanwhile, had invaded Africa, and been repulsed. A victory or two, however, gained by the Romans over other generals than Hamilcar, disposed the Carthaginians for peace, who accordingly agreed (b. c. 241) to evacuate Sicily, and to pay the victors a large sum of money. The Romans then made themselves masters of Sicily; and shortly afterwards they found a pretext for wresting Corsica and Sardinia from the Carthaginians. For twenty-two years after these conquests (b. c. 241–219) the Romans were engaged in wars with the Cisalpine Gauls and other nations in the north of Italy, the effect of which was to extend their dominion to the foot of the Alps. Beyond the Alps, also, Illyria, a country skirting the east coast of the Adriatic, was at this time annexed to the dominions of the Commonwealth.

Meanwhile the Carthaginians had not been idle. During several years they had, in accordance with the advice of Hamilcar, been establishing their dominion in Spain, intending to repay themselves with that fine peninsula for the loss of Sicily and Sardinia. Killed in battle by a native tribe, Hamilcar was succeeded in Spain by his son-in-law Hasdrubal; and on his death, which took place soon after, Hannibal Barca, the son of Hamilcar, and then only twenty-six years of age, was appointed to the command. The siege by him of Saguntum, an independent Spanish town, which had claimed the assistance of the Romans, led to the Second Punic War (b. c. 218–201). Little did the Romans know what a war it was to be! Crossing the Pyrenees, the young Carthaginian general, the greatest military commander probably, and certainly one of the ablest men the world ever saw, pushed his way through the Gallic tribes, and effecting the passage of the Alps, descended into Italy with an army of 12,000 Africans, 8000 Spaniards, and 6000 Carthaginian horse. Rousing the Cisalpine Gauls, and defeating in several successive battles the Roman generals sent against him, he made his way into the south of Italy (b. c. 217); and having in the following year inflicted on the Romans at Cannæ the greatest defeat they had ever received, he remained in Italy fifteen years (b. c. 217–202), moving hither and thither, keeping seven or eight Roman generals, and among them the wary Fabius and the bold Marcellus, continually employed, scattering the Romans like chaff wherever he appeared, exhausting the finances of the state, and detaching the Italian nations from their allegiance. Had he received reinforcements, as he expected, from Spain, where he had left his brother Hasdrubal in command, Rome might have fallen. Fortunately, however, for the Romans, while they were manfully opposing Hannibal in Italy, one of their generals, the great Scipio, was busily engaged in Spain. To prevent Spain from falling into Scipio's hands, Hasdrubal was obliged to remain in it; and it was not till b. c. 207, when all hope of retaining his footing in that peninsula was lost, that he set out to join his brother. He crossed the Alps in safety, but was attacked, defeated, and slain on his march through Italy; and Hannibal was left to his own resources. These, however, were exhaustless; and with the assist-

## HISTORY OF ROME.

ance of the Italian nations, who, especially the unprivileged classes, were friendly to the Carthaginians, and hated Rome, he might still have shattered the Commonwealth in pieces, had not Scipio passed over from Spain into Africa, and defeating the Carthaginians in several battles, with the help of a Numidian prince named Masinissa, compelled them to recall their greatest man for the defence of his native city. In a. c. 202, or the year of the city 552, Hannibal quitted Italy, where he had spent the best period of his life. Not long after his landing in Africa, he was defeated by Scipio at Zama, and his countrymen were obliged in consequence to agree to a peace on very severe terms.

The Second Punic War concluded, and Italy once more pacified, the Romans made war on Philip III., king of Macedonia, and virtual ruler of all the Greek states, who had offended them by entering into a treaty with Hannibal. The war was protracted over seventeen years (a. c. 214-197), but ended in the reduction of Macedonia, and the proclamation by the Romans of the independence of the other Greek states. Seized with a desire to assume the place which the Macedonian king had been unable to maintain, Antiochus the Great, king of Syria, and representative therefore of the Greek empire in Asia, crossed into Greece, where he joined the Ætolians against the Romans. Defeated, however, in Greece, and forsaken by the Ætolians, he was pursued into Asia, and after the loss of a great battle at Magnesia, obliged to submit to the Romans, who thus became virtual masters of the various kingdoms and states of Asia Minor (a. c. 188). Meanwhile they had been engaged in suppressing various movements among the Ligurians, Boians, Istrians, and other nations in the north of Italy, as well as among the Spanish tribes and the savages of Sardinia. A declaration of hostilities by Perseus, the successor of Philip in Macedonia, in conjunction with Genthius, king of Illyria, led to another war against these countries, which terminated in their complete subjugation (a. c. 168). The next twenty years were spent in securing these conquests, and in establishing relations, virtually those of sovereignty, with various states of Asia Minor, such as Bithynia and Rhodes; and with various others of Africa, as Egypt and Numidia. The whole circuit of the Mediterranean in their power, and their ships respected in all its ports, as belonging to the 'sovereign people of Italy,' the Romans at length executed their long-cherished project; and pounced upon Carthage (a. c. 149), whose existence, even in its fallen condition of a mere commercial capital, they could not tolerate. Hannibal had been dead more than thirty years; but under such generals as they had, the wretched Carthaginians offered a desperate resistance to the Roman commanders. After a horrible siege, the city, containing a population of 700,000, was taken and sacked by Scipio Æmilianus, the adopted son of the son of the great Scipio (a. c. 146). The houses were razed to the ground, and the province of Africa was the prize of this third 'Punic War.' The fall of Greece was contemporary with that of Carthage. The Achaian League, a confederacy of cities in Greece proper and the Peloponnesus, showing a disposition to be independent of the Romans, provoked their vengeance; and the destruction of Corinth in the same year as that of Carthage extinguished the last sparks of liberty in Greece. The whole of the Greek countries were parcelled out into Roman provinces, and from that time Greeks became the slave teachers of the Romans, their secretaries, their sycophants, their household wits. Yet out of Greece thus ruined there afterwards arose many great spirits; for no degradation, no series of misfortunes, could eradicate the wondrous intellect which lurked in the fine Greek organisation. The last scene in this long series of wars was enacted in Spain, where, roused by a noble patriot called Viriathus—the Wallace of that day—the native tribes had revolted against the Romans. The fate of Spain, however, was sealed by the destruction of Numantia by Scipio Æmilianus (a. c. 133).

By the wars of 130 years which we have thus enu-

merated, the following countries had become subject to Rome:—Sicily, Sardinia, Corsica, and the smaller islands of the Mediterranean; Macedonia; Illyricum, with Thessaly and Epirus; Greece, including Greece proper and the Peloponnesus; Spain; and the whole northern coast of Africa. The Romans had likewise established their influence in Asia. The conquered countries were divided into provinces, so that the designation for the Roman dominion became 'Italy and the Provinces.' The provinces received each an organisation at the time of its formation, according to its circumstances. Retaining their national habits, religion, laws, &c. the inhabitants of every province were governed by a military president, sent from Rome, with a staff of officials. Unlike the Italic nations, who furnished only subsidies of men to the sovereign state, the provincials were required to pay taxes in money and kind; and these taxes were farmed out by the censors—Roman citizens, who, under the name of *Publicans*, settled in the various districts of the provinces, and proved a great scourge by their avarice and rapacity. To some towns and localities in the provinces, the Italic franchise was extended as a token of favour. Altogether, the government of the provinces was one which, although it led to beneficial results, in binding together a large mass of the human race, and carrying on various races and languages simultaneously in a career of civilisation, yet gave great scope for oppression. Like a network proceeding from a centre, the political system of the Romans pervaded the mass of millions of human beings inhabiting the shores of the Mediterranean, holding them together by its mechanical tenacity, and slowly working them into union by its own powers of impregnation, as well as by means of those ideas and moral agencies whose dissemination and operation over large areas at once it so marvelously facilitated. What a career was thus opened up for those who occupied the centre of this network—the population of Rome! What a grand thing in those days to be a Roman citizen; so that, wherever one walked—in Spain, in Africa, or even in once great Athens—one was followed, flattered, flattered to one's face, and mocked behind one's back! What means of money-making in the provinces for the avaricious Romans! What opportunities for well-doing for the philanthropic! Alas! a philanthropic Roman was almost a contradiction in terms. To be patriotic was the highest virtue; and if a Roman, along with his patriotism, possessed a just disposition, those who were under his government might consider themselves fortunate. Nor was the career of administration in the provinces open to all Roman citizens. The following passage, which we translate from a French work—'Etudes sur l'Histoire Romaine, par Prosper Mérimé; Paris, 1844'—will give an idea of the manner in which a Roman citizen attained to public honours, and will illustrate the general spirit of the Roman administration. 'The laws,' says this author, 'opened to all the citizens the career of magistracy; but in reality it was shut against all but those whose fortune or family credit placed in an exceptional situation. As all public offices were obtained by the suffrages of the people, it was of the utmost importance to make creatures in every class of society. In order to muster all these on the great day of election, there were no labours, fatigues, and even meannesses to which Romans of illustrious families did not submit from their earliest boyhood. Some offered the patronage of their families to embarrassed pleaders; others opened their purse to poor artisans; whoever had a vote in the comitia was flattered and cajoled in every possible way. From the time that the candidate had attained the age at which the law permitted him to stand for the dignity of the questorship—that by which he must make his début in public life—he appeared in the Forum clothed in a white robe, shook hands with all the country folks, and with the lowest plebeians, solicited their votes, and often purchased them for money. The questor, once appointed, found the doors of the senate open for him.

Ordinarily he was attached to the person of a consul, or a magistrate of superior rank, becoming his lieutenant; sometimes he obtained a little government for himself. In these offices he could learn business habits, and find occasions for distinguishing himself, and for causing his name to be mentioned often in the senate or the assemblies of the people. After the quaestorship came the *Curule Edileship*, a purely civil magistracy, whose duties consisted in watching the arrival of provisions, guarding public monuments, seeing to the embellishment of the city, and finally, in preparing the games and solemn shows. This charge entailed enormous expense on those ediles who wished to make themselves popular. They built temples and porticoes at their own cost, opened roads, constructed aqueducts; above all, they tried to surpass their predecessors by the magnificence of the games which they caused to be celebrated, and the truly colossal expense of which they in part sustained. A happy man was that edile who had been able to exhibit in the arena the deaths of an unusual number of able gladiators, or who had presented to the people animals of a rare species or unknown before. His name was in every mouth, and all applauded his sprouting ambition. The edileship lasted a year. After it came the praetorship. There were six praetors—two presided over the tribunals at Rome, the others governed provinces or commanded armies. Finally, after having successively gone through the three previous stages, one presented himself as a candidate for the consulship. Intriguing, corruption, manoeuvring of all kinds was now redoubled; for this was the goal of a Roman's ambition. The consuls presided over the government of the republic, or directed important wars in person. At the expiry of their magistracy—that is, after a year—they were sent to a province with the title of Proconsuls; often to command military expeditions, almost always to administer an extensive government. In turn to amass and expend great wealth, was thus the chief care of candidates for honours. The profits of the quaestorship enabled one to make a brilliant curule edileship. Ruined by his extravagance, the edile repaired his fortune in the praetorship, and returned to Rome rich enough to buy votes at the consular election. Frequently he staked his all on this last election, confident of more than making it up again in the province which would be assigned him after his consulship. In a word, the career of public employment was a species of gambling, in which one's profits were proportional to one's stakes.

Such a state of things as is here described, implies that an immense change had taken place in the character of the Roman society during the rapid career of foreign conquest which had elevated Rome from the position of metropolis of Italy to that of metropolis of the civilised world. The distinction between patrician and plebeian was now scarcely heard of (in B.C. 172 both consuls had been plebeians for the first time); it was superseded by that between *illustrious* and *obscure*; *rich* and *poor*. Although, however, the system of corruption was so general, that scarcely any one could attain to office except by unworthy means, yet there were at that time, and in the midst of that system, many men of really noble character. Among these must not be forgotten the honest old censor Cato, the enemy of Carthage, who kept up a constant protest all his life against what he called the growing luxury of his countrymen, and died declaring that they were a degenerate race. Of equal integrity with Cato, although of altogether a different form of character, were the two brothers of world-famous name, whose actions we shall now briefly notice.

#### THE REVOLUTIONS OF THE GRACCHI.

'A fatal effect,' says M. Mérimée, 'of the Roman domination was the impoverishment and depopulation of Italy. At Rome, where commerce and industry were despised, only one way led to wealth—a career of public service. On his return from his government, a

Roman official bought lands, built villas, and all at once became a great proprietor. If he chanced to have in his neighbourhood an estate to his taste, he caused it to be ceded to him; sometimes he seized it while the lawful owner was fighting far away under the Roman eagles. By degrees all the small proprietors were despoiled, in order to form vast estates for the privileged class of public functionaries. Parks, gardens, and expensive fish-ponds took the place of cultivated fields. Labourers disappeared, and the country was peopled with slaves, dangerous by their numbers, and also by their robber habits, which they practised with impunity. Some masters, it is said, shared the profits of robbery with these wretches.'

The great social evils of the day—the extinction of the old peasant proprietors of Italy; and the vast increase of slaves, the danger of which had been already manifested by several servile revolts in Sicily; and the congregation in the towns, and especially in Rome, of vast masses of population, not living as the artisans and traders in modern towns do, by honest industry, but living in noisy idleness upon the alms of the provinces and the sums they received for their votes—these social evils must have struck many generous hearts among the Romans. The man, however, on whom they produced so decided an impression as to lead him to devote his life to their removal, was Tiberius Sempronius Gracchus, the son of a plebeian of rank who had attained distinction in the Spanish wars, and of Cornelia, the daughter of the great Scipio. Abandoning, in its first stage, the more tempting career which led through the quaestorship, edileship, and praetorship to the consulship, Tiberius chose rather the office of tribune of the people, which was more suitable for the purposes of political agitation. Elected to this office B.C. 133, in the twenty-ninth year of his age, he propounded his schemes of reform. His grand project was a revival, with some modifications, of the famous agrarian law of Licinius, which had long fallen into tacit desuetude. All citizens who were in possession of a larger extent of the state land than the 500 jugera allowed by the Licinian law (unless in the case of fathers of two sons, who were to be allowed 250 jugera in addition for each of them), were to be deprived of the surplus; the buildings, vine-presses, &c. which were erected on these surplus lands to be purchased at a fair valuation; and the whole land thus seized was to constitute a stock out of which the pauper plebeians of the city were to be furnished with little farms for the honest support of themselves and families, these farms to be incapable of alienation by the persons to whom they should be allotted. Utterly revolutionary as this measure would seem in modern legislation, and sufficiently sweeping as it was, even in a Roman point of view, considering that, however unjustly the ancestors of many of the large proprietors had come by their lands, yet long possession and frequent transference had in many cases sanctified the ownership—still the measure was strictly in the spirit of Roman law, and one of the supporters of Gracchus in proposing it was the eminent jurist Mucius Scaevola. Tiberius and his associates probably thought that the ends proposed—the removal of the venal mob out of Rome, and the restoration in Italy of a population of hard-working peasant proprietors, instead of the gangs of bandit slaves—were difficult enough to require, and glorious enough to justify, somewhat revolutionary means. Accordingly, advocating by his eloquence in the Forum the scheme which he had matured in private, he did not cease until, in spite of the most obstinate resistance on the part of the senators, who used as their instrument against him one of his own colleagues in the tribuneship, he had gained his end. Three commissioners were appointed to superintend the execution of the law—Tiberius himself, his father-in-law Appius Claudius, and his younger brother Caius. Loud and deep were the vows of vengeance on the part of the senators; and Tiberius saw that his only chance of life lay in being re-elected to the tribuneship, the dignity of which

was an inviolable protection. To prevent this, the senatorial party mustered all their strength; and a tumult ensuing on one of the days of election, Tiberius, along with about 300 of his followers, was killed.

For about ten years the excitement caused by the law of Gracchus continued, Fulvius Flaccus and Papirius Carbo acting as his successors in the popular interest, and carrying on the struggle against the nobles, who raised up obstacles to the execution of the law. But in the year B. C. 123, Caius Gracchus, who now felt himself old enough to assume the career which his brother had left him as an inheritance, claimed and obtained the tribuneship. Caius was a man of more vehement character and more comprehensive views than his brother, and the schemes which he proposed embraced a great variety of points, besides a re-enactment of his brother's agrarian law. In fact, a reformer by reputation and education, he made it his business to find out abuses, and either declaim against them or propose remedies for them. Perhaps the most objectionable of his measures was a law enacting a monthly distribution of corn among the city population at a nominal price—a poor-law, for such it may be called, which had the effect of attracting all the paupers of Italy to Rome. A more valuable measure was his transference of the judicial power from the senators, who had hitherto held it, and who had been guilty of great corruption in the exercise of it, to the *equites*, or wealthy capitalists, intermediate between the senators and the poorer classes of the community. He also proposed and carried the establishment of various colonies in different parts of the empire, which afforded room for enterprise, thus relieving Rome of part of its overgrown population. More fortunate so far than his brother, he held the tribuneship for two years, and thus had time for more extensive action. Deserted, however, by the people at the end of the second year, in consequence of the policy of his opponents, who adopted the plan of outbidding him for popular favour, he lost his office. The senators, having him at their mercy, spared no means of revenge; and Gracchus, and his friend Fulvius Flaccus, having recourse to the armed assistance of their supporters to preserve their lives when they appeared in public, this was construed into a design of sedition. The consul was empowered to resort to force against them; a terrible fray occurred in one of the quarters of the town, 3000, it is said, being slain; and Gracchus was killed while trying to escape into the country (B. C. 121). He was then only in the thirty-third year of his age.

The aristocracy thus triumphed for the time, and the recent measures of reform were suffered to fall into disuse; but certain portions of the policy of the two brothers had taken full effect, and the agitation which they had originated was not lulled for many years. The seeds of much that afterwards appeared in storm and bloodshed were sown during these movements of B. C. 133–121; and as long as the world takes an interest in Roman history, or respects disinterested political courage, it will remember the Gracchi.

THE JUGURTHINE, CIMBRIC, AND SOCIAL WARS—MARIUS AND SULLA.

In the year of the first tribuneship of Caius Gracchus, the Balearic islands were added to the Roman dominion; and six years afterwards (B. C. 117), Dalmatia was reduced to a Roman province. About this time the famous Jugurtha, the illegitimate son of one of the sons of Masinissa, already mentioned as a king of Numidia in the Roman interest, was left heir to that kingdom, in conjunction with his two cousins, by Micipsa, their father and his uncle. Aspiring to the undivided sovereignty, he killed one of his cousins, and drove the other to Rome. Interfering in behalf of the expelled prince, the Romans compelled Jugurtha to share Numidia with him. By bribing the commissioners, however, who were sent to effect the division, Jugurtha obtained the best part for himself; and not long after (B. C. 112), he showed his contempt for the

Romans by invading his cousin's dominions, and putting him to death. Bribes and wily tactics protected him for a while from the vengeance of the Romans; but at length, in the year B. C. 109, the brave consul Metellus, who was proof against bribes, went over to Numidia to conduct the war which his predecessors had mismanaged. After he had carried on the war successfully for two years, he was supplanted by his second in command, Caius Marius, a man of humble birth, and nearly fifty years of age, who, although almost without education, had raised himself to high rank by his military talents, and whose services under Metellus had been so favourably represented at Rome, that he was appointed consul (B. C. 107), with the express intention that he should end the Jugurthine war. This he speedily accomplished, greatly assisted by his quaestor, a young man of high patrician family and unusual literary accomplishments, named Lucius Cornelius Sulla. Jugurtha was sent to Rome, where he was starved in prison (B. C. 106); and the services of Marius were at the disposal of the Romans for a war of an infinitely more formidable character than that which had been waged against this ill-fated African.

About the year B. C. 113, a numerous tribe of savages, called Cimbri, but who were most probably Celts, had been set in motion in the south-east of Europe; and emigrating westward, they had communicated their restlessness to the Teutones, an undoubtedly German race, through whose territories they must have passed. Roving about in quest of settlements, sometimes together, and sometimes separately, the two barbarian hosts, consisting of men, women, and children, had thrown all Gaul into consternation; and as the Romans had already colonised the portion of Gaul contiguous to the Alps, the duty of checking the savages devolved on them, the more especially as there was some danger that Italy would be invaded. But such a moving mass of human beings, driven by that hardest of forces, hunger, was not easily to be checked; and army after army sent by the Romans to oppose them had been shivered to pieces. All Italy began to tremble, and there was a universal cry among the Romans, 'Make Marius again consul.' Accordingly Marius was chosen consul a second time in his absence (B. C. 104), that he might drive back the Cimbri. Meanwhile the poor homeless creatures had made a general rush towards Spain; and the Romans, to secure the services of Marius when they should be required, re-elected him to the consulship in B. C. 103, and again in B. C. 102. In the latter year, when Marius was consul for the fourth time, the barbarians, repulsed from Spain, directed their march towards the Alps. Fortunately, they divided themselves into two masses—the Teutones taking one route, the Cimbri another. The former, amounting to about 300,000 men, were met by Marius, and slaughtered, all except 90,000, who were made prisoners, and sold as slaves. Meanwhile the Cimbri had been making progress in their route, and to oppose them, Marius was elected to a fifth consulship (B. C. 101). Another bloody field, in which about 140,000 were slain, and 60,000 taken prisoners, delivered Italy from its fears. Strange and affecting thought, that half a million of human beings, men, women, and children, should be wandering through Europe for years, poor outcasts, with their little carts and cooking-kettles, and that a civilised nation should have been compelled, by the necessity of self-preservation, to take means to sweep them out of existence!

Marius was rewarded for his exertions with a sixth consulship (B. C. 100), which, there being now no enemy to call forth his military activity, he employed in political schemes for the humiliation of the aristocratic or senatorial party, to which, both by the accident of birth and on principle, he was a determined enemy. The efforts of the nobles, however, assisted by the violent conduct of the partisans of Marius, especially a tribune named Saturninus, occasioned a reaction; and on the expiry of his consulship, Marius withdrew from Rome, and undertook a journey to the East, where the Roman

influence was extending itself. During the following ten years the political agitations were incessant, the liberal spirit of that party of which Marius was the head developing itself every year in fresh manifestations, and the aristocratic party becoming every year more fierce and dogged in their opposition. On the aristocratic side, the ablest and most earnest man, although not yet the most distinguished, was Sulla—the former quaesitor of Marius, and who had since been employed in various capacities both military and civil. At length, in the year B.C. 90, a storm which had been long gathering burst out in that war which is denominated in history 'the Social or Marsic War,' or 'the War of Italian Independence.'

As early as the tribuneship of Caius Gracchus, a clamour had been raised for the emancipation of the various Italian states from the thralldom in which they were held by the Romans. The progress of time welding the various Italian nationalities into one common society, and giving to all parts of the peninsula a common interest, had made them sensible to the grievances arising from their subordinate condition. The system of a triple franchise—Roman, Latin, and Italian—inevitable perhaps at first, had now become a source of gross injustice. To put an end to this injustice, the Italians demanded the full Roman franchise. Caius Gracchus wished to bestow it on them; and from the time of his death, 'Italian emancipation' had been one of the watchwords of the liberal party. Despairing of effecting their end by agitation, and especially provoked by a recent persecution of the Italian tradesmen who had settled in Rome, the Italian nations had recourse to arms (B.C. 90). Ten of these—namely, the Piceni, the Vestinians, the Marrucenians, the Marsians, the Pelignians, the Samnites, the Prentanians, the Hirpinians, the Lucanians, and the Apulians, constituted themselves into a confederacy for the destruction of Rome, and the foundation of a new Commonwealth, of which Corfinium, under the new name of Italica, was to be the capital, and which was to embrace the whole peninsula. Fortunately for Rome, the Latins (including the various colonies of the Latin name throughout Italy), the Etruscans, the Umbrians, and the Campanians, did not join the confederacy. The Latins were instantly rewarded with the Roman franchise, and the field was taken against the confederacy. During two years, the war was carried on vigorously on both sides, the most distinguished of the Roman generals being Marius, Sulla, and Cneius Pompeius Strabo. At length (B.C. 89), the Italians having been greatly reduced, and the whole peninsula having suffered much, the Romans saw fit to yield to demands which many even of those whose patriotism led them to fight against the allies believed to be just. The Roman citizenship was extended to all the nations of the peninsula south of the Po, the new citizens being either distributed, according to one account, among eight of the old tribes, or arranged, according to another, in fifteen new ones. At the same time the Latin franchise was conferred on the Gauls between the Po and the Alps.

Sulla had gained greater distinction in the Marsic War than Marius, who was now verging on old age. The public eye was consequently turned to Sulla; and as, on the appearance of the Cimbric hosts twenty years before, the Romans had placed their dependence on Marius, so now, on the breaking out of a war in the East, they placed their dependence on his younger rival. Mithridates VI., the young king of Pontus, an Oriental by birth, but of Greek education, and a man of splendid abilities, had been for some years silently extending his dominions in western Asia; and the Romans, long jealous of his movements, had at length openly warned him to desist. Mithridates scouted the warning; marched through Asia Minor, putting the Romans to the sword; and was welcomed everywhere by the Asiatic Greeks as a deliverer from the Roman yoke: ultimately (B.C. 88), crossing over into Greece, he menaced the Empire near its centre. Sulla, then engaged with the Samnites, the last dregs of the Social

War, was chosen consul, and invested with the command against the Eastern monarch. He was then in the forty-ninth year of his age. Vexed at the preference of his rival, the grim old Marius used all his efforts to have the appointment cancelled, and himself nominated to the Mithridatic command. His political opinions recommending him to many, and a tribune named Sulpicus having procured the passing of a preliminary measure distributing the new Italian citizens among all the old tribes, which had now attained the number of thirty-five, he at length carried his point, and Sulla was superseded. But the aristocratic general was not a man to be trifled with. Marching from the south of Italy, where he was when he heard the news, he appeared with his army before the city, forced his entrance through the rotten walls, dislodged his antagonists from the houses from which they were throwing stones and missiles at his men, and compelled Marius and his adherents to save their lives by a precipitate flight. Marius escaped to Africa; Sulla, after settling affairs at Rome, set out for Greece. Here he speedily retrieved the Roman losses; sacked Athens, which had provoked him by its opposition; and reduced Archelaus, the general of Mithridates, to such extremities, that having crossed into Asia, Mithridates was glad to conclude a peace with him (B.C. 84), by which he renounced all he had gained, and agreed to pay the expenses of the war. Meanwhile a terrible reaction had occurred at Rome in Sulla's absence. Scarcely had he left the city (B.C. 87), when Lucius Cornelius Cinna, one of the consuls whose appointment he had sanctioned, proclaimed himself on the popular side, and commenced a series of measures directly opposed to Sulla's views. His colleague Octavius drove him from Rome, and the senate deposed him from the consulship. The Italians, however, gathered round Cinna; Marius and his fellow-exiles hearing of the movement, hastened back to Italy; all the able military men of the Marian party, and among them a young and generous commander named Sertorius, exerted themselves to raise troops; and at length the aristocratic party found themselves besieged in Rome. Famine and a pestilence began their ravages in the city; and the senate, reinstating Cinna in the consulship, capitulated on the understanding that blood should not be shed. But there was little softness in the nature of Marius. Admitted into the city, the stern old man, who was already tottering on the brink of the grave, revenged his wrongs by a frightful massacre, in which many men of distinction fell. Marius then caused himself to be elected to a seventh consulship (B.C. 86), his colleague being Cinna. He enjoyed the unprecedented honour but a few days, dying on the 13th of January (B.C. 86), and Valerius Flaccus was named his successor. Flaccus, setting out with authority to supersede Sulla in the Mithridatic war, was murdered by his legate Flavius Fimbria, who assumed the command of the army, and gained some successes; but being afterwards hard pressed by Sulla, and deserted by his army, committed suicide. This occurred about the time of the conclusion of the peace with Mithridates (B.C. 84); and Sulla, after settling the affairs of Asia Minor, and draining the country of money, so remorselessly as to affect its prosperity for a century, commenced his journey homewards, with bloody purposes against Cinna and his adherents, and an army ready to execute them.

Cinna did not live to face his dreadful enemy. Murdered by his soldiers in his fourth consulship, he left, as his successors in the leadership of the popular party, Caius Marius the Younger, Papirius Carbo, and the brave Sertorius—the two former of whom were chosen consuls for the year B.C. 82, to oppose Sulla in Italy, while Sertorius was despatched to Spain to secure that province. But Carbo and the younger Marius, even when backed by the brave Samnites and other Italian nations, were not equal to a contest with such a general as Sulla, assisted as he was by commanders like Metellus, Lucullus, and young Cneius Pompeius Strabo, more commonly called Pompey, the son of that Pom-

## HISTORY OF ROME.

peius who had been one of the Roman generals in the Marius War. The consular armies were defeated; Marius killed himself; Carbo fled to Africa; and Sulla remained master of Italy. Fearful was his vengeance. The massacre which Marius had ordered five years before, was slight compared with the butcheries which took place by the command of Sulla. In Rome, and over all Italy, every man of distinction implicated in the popular movement was sought out and slain. Proscription lists, as they were called—that is, lists of doomed individuals—were published; and soldiers were ready to track them out for the prices put upon their heads. Military colonies were likewise planted in all parts of Italy—lands being taken by force for that purpose: thus purging Italy of the Marian leaven, Sulla was resolved to create in it a new population, which should be pliant to aristocratic influence.

The work of the soldier over, Sulla commenced that of the legislator. Appointed perpetual dictator a. c. 82, he continued for three years to exercise the sovereignty, making alterations in the constitution, the general effect of which was to lessen the power of the people in political affairs, and reforming the criminal law. In a. c. 79, he surprised every one by abdication the dictatorship, and retiring into private life; and in the following year he died of a loathsome and incurable disorder, brought on by his debaucheries. Among other evidences of Sulla's literary accomplishments, he left memoirs of his own life composed in Greek.

### POMPEY—CICERO—CATILINE—CÆSAR.

After the death of Sulla, the most distinguished man of the aristocratic party was Pompey, who had been engaged in reducing Sicily and Africa to allegiance after his chief had triumphed in Italy. Some attempts were made to revive the Marian cause after the dictator's death, but by the exertions of Pompey and others they were suppressed, and only in Spain had the Marian party still a stronghold. There the brave Sertorius, at the head of the Marian refugees and the native Spaniards, was fast establishing a power likely to rival that of Italy. None of the Sullanian generals, not even Pompey, who went to Spain in a. c. 76, could gain an advantage when opposed to his splendid generalship; and had he not perished by treachery (a. c. 74), Spain would have become an instrument in his hands for overturning all that had been done by Sulla in Italy. Possibly even Spain might have superseded her sister peninsula as the seat of Roman power. But after the death of Sertorius, his army crumbled away; and, conquering his successor Perpenna, Pompey found the pacification of Spain an easy task. Returning to Italy in the height of the reputation which the discharge of this office procured to him, he arrived (a. c. 71) in time to have some share in another war of a frightful character which had been desolating Italy in his absence. In the year a. c. 73, seventy gladiators, headed by a Thracian named Spartacus, had broken out of a school, or rather gladiator warehouse, at Capua, where they were kept in training; and, speedily joined by all the slaves and gladiators of the neighbourhood, they had taken up their position on Mount Vesuvius. Finding himself at the head of a large army, Spartacus had given battle to several Roman generals, and defeated them; and the conquering host which he commanded was on the point of crossing into Sicily, after ravaging Italy, when it was attacked and cut to pieces by the prætor Licinius Crassus (a. c. 71). Spartacus died fighting; such of the gladiators and slaves as were taken prisoners were crucified, or impaled alive; and the remnant which had escaped Crassus were met and destroyed in the north of Italy by Pompey, as he was returning from Spain. Pompey and Crassus were chosen consuls for the year a. c. 70, the former being then in his thirty-sixth year. Although both were disciples of Sulla, yet, obeying the necessities of the time, they repealed several of his enactments, and passed various measures of a liberal tendency.

Pompey was at this time the idol of Rome; and

although after his consulship he retired into private life, he was soon called upon to exercise his abilities in a post of greater dignity and responsibility than had ever been formally conferred on any Roman before him. The Mediterranean was at that time infested with pirates, who had become so numerous and so audacious during the recent convulsions, that the coast of the Italian peninsula itself was not safe from their attacks, and not a ship could sail from any port in the Roman dominions, even in the service of government, without the risk of being captured. To enable Pompey to free the Empire from this nuisance, he was invested (a. c. 67) with supreme command for three years over the whole Mediterranean and its coasts for 400 stadia inland, with power to raise as many men and ships and as much money as he chose. Thus virtually made master of the Roman world, Pompey exerted himself so vigorously and judiciously, that within the short period of three months he had cleared the sea of every pirate vessel. That his command might not lie dormant for the remainder of the three years for which he had been appointed, a tribune of the people proposed and carried a law conferring on him the additional command of Pontus, Bithynia, and Armenia, in order to secure his services in finishing a war which was then going on with Mithridates. This was the third war with that monarch; for there had been a second short war with him a. c. 83-81. The present war had originated in some overtures made by Sertorius to Mithridates in a. c. 74; but Sertorius having died in the same year, Mithridates was left to maintain the war alone. The general sent to oppose him was Lucullus, who carried on the war very successfully till Pompey came to supersede him. For four years Pompey remained in Asia, breaking the power of Mithridates, and negotiating with the monarchs of Parthia, Armenia, &c. He traversed the greater part of Asia Minor, establishing the Roman influence; de-throned the king of Syria, and added it and Phœnicia to the number of the Roman provinces; entered Palestine, where a civil war was then raging between the brothers Hyrcanus and Aristobulus, declared in favour of the former, besieged and took Jerusalem, and having imposed a tribute on the Jews, commenced his march homewards. On his return through Asia Minor, he found that Mithridates had in the meantime killed himself in despair; and as there was no one to take up that monarch's part, he was able to parcel out Asia Minor as he chose—erecting some portions into provinces, and giving others in charge to tributary princes. With the glory of having thus subjugated and settled the East, the fortunate Pompey prepared to return to Rome in the year a. c. 62.

Meanwhile Rome had been the scene of one of the most extraordinary attempts at revolution recorded in history—the famous conspiracy of Catiline. No passage in Roman history is involved in such obscurity as this; for the accounts of the conspiracy left by Sallust and other Latin authors are not nearly so satisfactory to the genuine student of history, as they are pleasant to the mere reader for amusement. M. Mérimée supposes that, several years after Sulla's death, there arose in Rome four distinct parties—the 'oligarchical faction,' consisting of the small number of families, the chiefs of which directed the senate, and in fact governed the republic; the 'aristocratic faction,' comprehending the mass of the senators, anxious to exercise the power which they saw usurped by a small number of their colleagues; the 'party of Marius,' including all those whose families had been persecuted by Sulla, and who now began to rally, and aspire to power; and lastly, the 'military faction,' embracing a crowd of old officers of Sulla, who, having squandered the fortunes they had gained under him, and seeing themselves excluded from public affairs, were eager for some convulsion which might improve their condition. At the head of the first party was Pompey, now absent in Asia. In his absence, the soul of the oligarchical party was the celebrated Marcus Tullius Cicero—an advocate

## CHAMBERS'S INFORMATION FOR THE PEOPLE.

of extraordinary intellect, born B.C. 106, a few months after Pompey, and who, entering public life early, had soon established his reputation as the first orator in Rome. Of plebeian birth, it might have been expected that he would attach himself to the democratic side; but circumstances, and his natural disposition, which was weak, and fond of the consideration of others, had won him over to the side of the oligarchy, to whom his talents were invaluable. Having passed through the quaestorship, edileship, and praetorship, which last he held B.C. 66, he now aspired to the highest dignity in the state. Such was the leader of the oligarchical party. The leader of the aristocratic party was Crassus, formerly the colleague of Pompey in the consulship, and now his personal rival. Besides Crassus, the senators had an active and most conscientious partisan in Marcus Porcius Cato, who had been tribune of the people—a great-grandson of Cato the Censor, and possessed of all his integrity. The leader of the third or Marian party was a man six years younger than Pompey or Cicero, and who, known during his youth for his accomplishments, his love of pleasure, his firmness of purpose, and the boundless generosity of his character, had just earned for himself the applauses of all Rome by the lavish magnificence of his edileship (B.C. 65). This was Caius Julius Caesar, the greatest man that ever Rome produced. He was the son of a man who had died suddenly, without having made any figure in public life; his family was one of the noblest in Rome; and his aunt had been the wife of Marius. Literature and pleasure had occupied his youth, and only now was he beginning to take an active part in public affairs, although with a force and earnestness which at once marked him out as a man who was to lead. With a chivalrous recklessness of consequences, he had done justice to his uncle's memory at a time when it was hardly safe to mention the name of Marius; and now the relics of the Marian party gathered round him with hope, while the oligarchy and aristocracy, with the presentiment of what he was to become, would fain have crushed him. Nine years older than Caesar, and three years older than Cicero or Pompey, was the leader of the fourth or military faction—Lucius Sergius Catilina, more commonly called Catiline, a man of illustrious birth, and who had distinguished himself as one of the ablest and most ferocious officers of Sulla. His reputation, owing partly to his haggard personal appearance, and partly to vague rumours of horrible crimes which he had committed, was one of the blackest; and as he walked along the streets with gigantic body, but hurried and uncertain step, men pointed, and said that that was Catiline. Yet he possessed extraordinary abilities, and a peculiar power of fascinating those with whom he wished to establish a friendly relation. He had already been praetor (B.C. 67), and there was a large class, consisting principally of debauched young patricians and ruined military men, who looked forward eagerly to his election to the consulship.

Prevented, by a charge of extortion brought against him in his capacity of praetor, from becoming a candidate for the consulship of the year A.C. 65, Catiline came forward as candidate in the following year. Cicero was his rival; and the senators mustered in sufficient strength to return the orator. Enraged at his defeat, Catiline began to plot a seditious movement with his patrician adherents, among whom were Lentulus, Cethegus, Cæparius, Statilius, &c. Rome, it was said, was to be set on fire, and the consuls and many of the senators murdered. Towards the end of the year (B.C. 64), these designs had become ripe, and emissaries of Catiline were abroad throughout Italy. Meanwhile Cicero had obtained private intelligence of the conspiracy, and on the 8th of November he addressed Catiline in such vehement terms in the senate-house, that the conspirator fled into Etruria, from which he continued to correspond with his accomplices in Rome. Having obtained satisfactory proofs of the guilt of these accomplices, and having been empowered by the senate to act as he chose for the good of the

state, Cicero caused Lentulus, Cethegus, Statilius, and Cæparius to be apprehended; and these four, notwithstanding the motion of Cæsar for a more moderate punishment, were put to death in prison: Cicero's activity had saved the Commonwealth. Catiline, however, who had raised troops in Etruria, continued to menace the state till the beginning of A.C. 62, when he and many of his patrician supporters died fighting like lions against the troops sent to destroy them. Thus the insane movement of the military faction was crushed: there remained, however, much of the Catilinarian leaven diffused through Italy—men of broken fortunes and profligate characters, to whom turmoil and riot afforded the only chance of promotion.

### THE TRIUMVIRATE—CÆSAR'S GALLIC WARS—WAR BETWEEN CÆSAR AND POMPEY.

When Pompey returned to Rome (B.C. 61), he found the senatorial party predominant, and Cicero incessantly talking about the Catilinarian conspiracy, and how he had crushed it. Pompey enjoyed a triumph more splendid than any conquering general had received before him; and the sums which he added to the public treasury were enormous; yet he could not procure from the senate that general ratification of his measures in Asia to which he thought himself entitled. Cato and other senators insisted on a full investigation of his measures one by one, ere the sanction which he required should be granted. This conduct on the part of the senators brought Pompey into closer connection with Cæsar; and these two eminent men, finding that they agreed in many of their views, and that at least they were at one in their opposition to the senate, resolved to unite their forces so as to work for their common ends with double strength. For various reasons, it was found desirable to admit Crassus to this political partnership; and accordingly, in the year B.C. 60, was formed that famous coalition for mutual support between Pompey, Crassus, and Cæsar, which is known in Roman history by the name of the 'First Triumvirate.' Elected to the consulship of the year A.C. 59, Cæsar infused new life into Roman politics, proposing measures of so liberal a nature, and persevering in them with such obstinacy, that the senate became almost frantic, and his colleague Bibulus shut himself up in his house for eight months in disgust. Among these measures was a ratification of Pompey's proceedings in Asia, and an agrarian law for providing lands for Pompey's disbanded soldiers and a number of destitute citizens. In the same year Cæsar gave his daughter Julia in marriage to Pompey, who had already been married twice. On retiring from the consulship, he obtained, by an unusual stretch of generosity on the part of the grateful people and the intimidated senate, the supreme command for five years over the two Gauls (Cisalpine and Transalpine) and Illyricum. This was probably the great object of Cæsar's desires; at all events, it was the best possible thing which could have happened for him and the republic. Master of Gaul, and with an army devoted to his will, he could there mature his power silently and undisturbed, and qualify himself for entering, at the proper period, upon the career for which he was destined, and rescuing, by military force, the ill-governed Empire out of the hands of contending factions.

The condition of affairs in Rome during Cæsar's absence in Gaul was indeed such as to prove the necessity of some radical change in the system of the Commonwealth. All was confusion and violence. Clodius, a profligate relic of the Catilinarian party, having been elected to the tribuneship of A.C. 58, procured the banishment of Cicero for his conduct in the affair of the conspiracy. In the following year, however, Clodius having in the meantime made himself generally odious, Cicero was recalled. Pompey and Crassus were elected consuls for the year A.C. 55. Mindful of their connection with Cæsar, who was of course in constant correspondence with them, they procured a prolongation of his command over the Gauls

for a second period of five years; at the same time obtaining for themselves—Pompey, the government of Spain for five years; and Crassus that of Syria and the adjacent countries for a similar period. In b. c. 55, Crassus set out for the scene of his command, where, soon afterwards, he perished in a fruitless expedition against the Parthians; Pompey remained at home, governing Spain by deputies. During several subsequent years, Rome was in a state of anarchy and misrule—the streets perambulated by armed mobs, partisans on the one hand of Clodius, and on the other of a powerful citizen called Milo, between whom a feud was carried on, as desperate and bloody as any that ever distracted a European town in the middle ages. In one of the numerous scuffles which took place between the contending parties, Clodius was killed; and taking advantage of the opportunity, the tottering government asserted its rights by bringing Milo to trial, and procuring his banishment.

Meanwhile the remedy was preparing. Among the marshes and forests of Gaul, the great Cæsar was accumulating that strength of men and purpose with which he was to descend on Italy and shiver the rotten fabric of the Commonwealth. 'Fain,' says the eloquent Michelet—'fain would I have seen that fair and pale countenance, prematurely aged by the debaucheries of the capital—fain would I have seen that delicate and epileptic man, marching in the rains of Gaul at the head of his legions, and swimming across our rivers, or else on horseback, between the litters in which his secretaries were carried, dictating even six letters at a time, shaking Rome from the extremity of Belgium, sweeping from his path two millions of men, and subduing in ten years Gaul, the Rhine, and the ocean of the north. This barbarous and bellicose chaos of Gaul was a superb material for such a genius. The Gallic tribes were on every side calling in the stranger; Druidism was in its decline; Italy was exhausted; Spain unmanageable; Gaul was essential to the subjugation of the world.' Cæsar's Gallic wars of themselves form a history. We have an account of them yet remaining from the pen of the conqueror himself, and that of his friend Hirtius. Suffice it to say, that in eight years (b. c. 58-50) Cæsar had conquered all Gaul, including the present France and Belgium; had paid two visits to the island of Great Britain (b. c. 55-54); and was able, in the spring of b. c. 50, to take up his residence in Cisalpine Gaul, leaving the 300 tribes beyond the Alps, which he had conquered by such bloody means, not only pacified, but even attached to himself personally. His army, which included many Gauls and Germans, were so devoted to him, that they would have marched to the end of the world in his service.

Cæsar's conquests in Gaul were of course a subject of engrossing interest at Rome, and when the city enjoyed an interval of repose from the commotions caused by Clodius and Milo, nothing else was talked of. 'Compared with this man,' said Cicero, 'what was Marius?' and the saying was but an expression of the popular enthusiasm. Cæsar's visits to Britain excited especial interest; and at first there were not wanting sceptics who maintained that there was no such island in existence, and that the alleged visit of Cæsar to that place of savages, where pearls were found in the rivers, was a mere hoax on the public. As, however, the period of Cæsar's command drew near its close, and it became known that he aspired to a second consulship, the fears of the aristocratic party began to manifest themselves. 'What may not this conqueror of Gaul do when he returns to Rome?' was the saying of Cato and others of the senators. 'Accustomed during so many years to the large and roomy action of a camp, will he be able to submit again to civic trammels? Will he not rather treat us as if we were his subordinate officers—Roman laws as if they were savage customs—and our city itself as if it were a Gallic forest?' Unfortunately, also, the Triumvirate no longer existed to support Cæsar's interests. Crassus was dead; and Pompey—whose connection with Cæsar had been severed

by the death of his wife, Cæsar's beloved daughter Julia (b. c. 54)—had since gone over to the aristocratic party, to which he had formerly belonged, and whose policy was, upon the whole, more genial to his character. In b. c. 52, he enjoyed a third consulship, without a colleague, having been appointed by the senators as the man most likely to restore order to the distracted state; and during the following year, he lent his aid to those enemies of Cæsar who insisted that, ere he should be allowed to stand for the consulship, he should be obliged to resign his Gallic command, and resume his station as a private citizen, ready to meet any charges which might be brought against him. Cæsar did not want agents in Rome—some of them paid, some of them voluntary—to plead his cause; and through these he offered to resign his command, provided Pompey would do the same with regard to Spain. The proposal was not listened to; and a decree of the senate having been passed that Cæsar should disband his army against a certain day, under pain of being treated as a public enemy, his agents left the city, and hastened to his camp in Cisalpine Gaul (b. c. 50).

Cæsar did not delay a moment. Sending orders to his various legions distributed through Gaul to follow him as speedily as possible, he placed himself at the head of such forces as were with him at the instant, crossed the small stream called the Rubicon, which separated his province of Cisalpine Gaul from Italy, and advanced towards Rome, amid cheers of welcome from the populations which he passed through. Utterly bewildered by his unexpected arrival, the whole senatorial party, with Pompey at their head, abandoned Rome, and proceeded into the south of Italy, where they tried to raise forces. Cæsar pursued them, and drove them into Greece. Then hastening into Spain, he suppressed a rising Pompeian movement in that country. Returning to Rome with the title of Dictator, which had been bestowed on him in his absence, he passed various salutary measures for restoring order in Italy, and among them one conferring the Roman citizenship on the Cisalpine Gauls; then crossed over into Greece (b. c. 49) to give battle to Pompey, who had meanwhile assembled forces from all parts of the Roman dominion. At length the two armies met on the plain of Pharsalia in Thessaly (9th August b. c. 48), when Pompey sustained a complete defeat. Not long afterwards he was killed by the orders of Ptolemy, king of Egypt, when seeking to land on the coast of that country. Cæsar, who had used his victory with great moderation, arrived in Egypt soon after, and remained there several months, fascinated by Cleopatra, who was then at war with her brother Ptolemy.

Having settled the affairs of Egypt, Cæsar proceeded to Asia Minor, crushed an insurrection there headed by Pharnaces, the son of Mithridates, and then (September b. c. 47) returned to Italy. He remained there but a few months, setting out in the beginning of b. c. 46 for Africa, where the relics of the Pompeian party had taken refuge. These were soon defeated; and Cato, the most distinguished man among them, killed himself rather than fall into the conqueror's hands. Pompey's two sons escaped to Spain, where they excited an insurrection, which, however, was soon suppressed.

EXTINCTION OF THE COMMONWEALTH—DICTATORSHIP AND DEATH OF CÆSAR—THE SECOND TRIUMVIRATE—CIVIL WARS OF MARK ANTONY AND OCTAVIANUS.

From August b. c. 48, when he defeated Pompey at Pharsalia, till March b. c. 44, when he was assassinated, Julius Cæsar was supreme master of the Roman world. Senate and people vied with each other in conferring dignities upon him; and all the great offices and titles recognised by the Roman constitution—as consul, dictator, censor, tribune, &c.—were concentrated in his person, while he exercised the virtual patronage of almost all the rest. In short, the Commonwealth may be said to have ceased when he defeated Pompey; and had he lived long enough, there is no doubt that he would have fully established the Empire. It was not so much,

however, in organic changes of the constitution, as in practical reforms of vast moment, that Cæsar exercised the enormous power which had been placed in his hands. Besides the various measures of reform which he actually carried into effect during his dictatorship, among which his famous reform of the Calendar deserves especial mention, there were innumerable schemes which he had projected for himself, and some of which he would probably have executed, had his life not been cut short. To extend the Roman dominion in the East; to drain the Pontine marshes; to cut through the Isthmus of Corinth; to prepare a complete map of the Roman Empire; to draw up a new digest of Roman law; to establish public libraries in the metropolis—such were a few of the designs which this great man entertained at the time when the conspiracy was formed which led to his assassination. At the head of this plot, which consisted of about sixty persons of note, were Brutus and Cassius, both men of the highest abilities, and esteemed by Cæsar; and the former at least actuated by motives of the purest character. The immediate occasion of the conspiracy was the rumour that Cæsar intended to accept the title of king, which some of his adherents were pressing upon him. When the plot was matured (B. C. 44), it was resolved that Cæsar should be assassinated in the senate-house on the ides (the 15th) of March, on which day it was understood a motion was to be brought forward by some of his friends for appointing him king of Italy. 'Upon the first onset,' says Plutarch, 'those who were not privy to the design were astonished, and their horror at the action was so great, that they durst not fly, nor assist Cæsar, nor so much as speak a word. But those who came prepared for the business enclosed him on every side, with their naked daggers in their hands, and which way soever he turned he met with blows, and saw their swords levelled at his face and eyes. Brutus gave him one stab in the groin. Some say that he fought and resisted all the rest, and moved from one place to another, calling for help; but when he saw Brutus's sword drawn, he covered his face with his robe, and quietly surrendered himself, till he was pushed, either by chance or by design, to the pedestal on which Pompey's statue stood, which by that means was much stained with his blood: so that Pompey himself may seem to have had his share in the revenge of his former enemy, who fell at his feet, and breathed out his soul through the multitude of his wounds; for they say he received three-and-twenty.'

The assassination of Cæsar has justly been pronounced 'the most stupid action that ever the Romans committed.' The later ages of the republic had been one continued scene of violence and anarchy; and not until Cæsar had risen to the chief power in the state was there a restoration of order and efficient government. His assassination plunged the Roman dominions into new and complicated civil wars. On the one side were the conspirators, with Brutus and Cassius at their head, bent on the futile project of throwing back the Empire into the condition of a republic. On the other were Mark Antony, an able and valiant officer of Cæsar's; Lepidus, another officer of less distinguished abilities; and Marcus Octavius, a young man of eighteen, Cæsar's grandnephew, and who, as his uncle's heir, now assumed the name of Caius Julius Cæsar Octavianus. These three united themselves into a triumvirate (November B. C. 44) for avenging Cæsar's death, and settling the affairs of the republic. After making themselves masters of Italy, and putting to death by wholesale proscription all those citizens whose views they suspected, among others the great and amiable Cicero, they pursued the conspirators into Greece. At length, in the autumn of B. C. 42, two great battles were fought at Philippi in Macedonia between the republican forces and those of the triumvirate. The former were defeated; Cassius caused himself to be slain, Brutus committed suicide, and the triumvirs thus remained masters of the Roman world. They divided it among them: Antony assuming the government of the

East, Lepidus obtaining Africa, and Octavianus returning to Italy, master of the countries adjacent to that peninsula. Each continued to govern his share for some time independently; but a quarrel ensuing between Octavianus and Lepidus, the latter was deprived of his power, and obliged to retire into private life. The Empire was now divided between Antony and Octavianus, the former master of the East, the latter of the West. At length, however, political and private reasons led to a rupture between the two potentates (A. C. 33). The rash and pleasure-loving Antony, who had been caught in the toils of Cleopatra, the licentious queen of Egypt, and therefore one of his subject sovereigns as master of the East, was no match for the cunning, abstemious, and remorseless Octavianus. Defeated at the battle of Actium (2d September A. C. 31), he fled with Cleopatra to Egypt, where, being hard pressed by Octavianus, they both died by their own hands. Octavianus thus remained sole master (A. C. 30) of the great Empire which Julius Cæsar had prepared for him; and under the new name of Augustus, he continued to wield the sovereignty during the long period of forty-four years (A. C. 30—A. D. 14). During these forty-four years, the various races and nations which so many centuries of conquest had connected together, became consolidated into that great historic entity—'The Roman Empire.'

## CONDITION OF THE EMPIRE UNDER AUGUSTUS.

The Roman Empire under Augustus consisted of Italy and the following countries governed as provinces:—In Europe, Sicily, Sardinia, and the other islands in the west of the Mediterranean, Gaul as far as the Rhine, Spain, Illyricum, Dalmatia, Pannonia, Thrace, Macedonia, Greece, and the islands of the Ægean; in Asia, all the countries between the Caspian Sea, the Parthian Empire, the Persian and Arabian Gulfs, the Mediterranean, and the Caucasus; and in Africa, Mauritania, Numidia, the ancient territory of Carthage, Cyrene, and Egypt. Within these limits there may have been included, in all, about 100,000,000 of human beings, of different races, complexions, languages, and degrees of civilisation. Not less than one-half of the whole number must have been in a condition of slavery, and of the rest, only that small proportion who, under the envied name of Roman citizens, inhabited Italy, or were distributed, in official or other capacities, through the cities of the Empire, enjoyed political independence. These 'citizens,' diffused through the conquered countries, constituted the ingredient by which the whole was kept in union. Working backwards and forwards in the midst of the various populations in which they were thus planted, the Romans assimilated them gradually to each other, till Celts, Spaniards, Asiatics, &c. became more or less Romanised. This process of assimilation was much facilitated by the circumstance that, with the exception of Judea and other portions of the East, all the nations of the Roman Empire were polytheistic in their beliefs, so that there was no fundamental repugnance in this respect between the modes of thought of one nation and those of another. In fact, the Roman Empire may be defined as a compulsory assemblage of polytheistic nations, in order that Christianity might operate over a large surface at once of that polytheism which it was to destroy and supersede. In the twenty-fifth year of the reign of Augustus, and while that prince was ruling with undisturbed sway over 100,000,000 of fellow-polytheists, there took place in that small monotheistic corner of his dominions which lay on the southern border of the Levant, an event, the importance of which the wisest of the Romans could not have foreseen. This was the birth, in an obscure Jewish town, of Jesus Christ. From that town, and from that obscure corner of the vast Roman Empire, was to proceed an influence which was to overspread the polytheistic nations, eat out or dissolve into itself all existing creeds and philosophies, and renovate the thoughts, the habits, the whole constitution of mankind. Waiting for this influence, the various nations—Celts, Greeks, Spaniards, &c.—were submitted

## HISTORY OF ROME.

to the preliminary pressure of Roman institutions, modifying, and in some cases changing, their native characters. The eastern half of the Empire, however, had been too thoroughly impregnated with the Greek element to yield easily to the new pressure; and accordingly while the Latin language spread among the barbarians of the west, Greek still continued to be the language of the East. This demarcation between the western or Latin-speaking and the eastern or Greek-speaking portions of the Empire became exceedingly important afterwards.

Of this vast empire Rome was the metropolis, now a city of innumerable streets and buildings, and containing, it is calculated, a population of about two millions and a-half. From Rome roads branched out in all directions leading to the other towns of Italy, and passing through the villa-studded estates of the rich Roman citizens. From the coasts of Italy, the Mediterranean afforded an easy access to the various provinces, by whose industry the metropolis and Italy itself were in a great measure supported. The provinces themselves were traversed by roads connecting town with town, and laying all parts of the Empire open to the civil and military functionaries of government. Usually residing at Rome, the will of the emperor vibrated through a hierarchy of intermediate functionaries, so as to be felt throughout the whole of his vast dominions. In effect, this will was absolute. In Augustus, as in Julius Cæsar, all the great offices of state, which had so long subsisted as mutual checks upon each other, were united, so as to confer on him power of the most unlimited description. The senate still met, but only as a judicial body in cases of treason, or legislatively to pass the decrees which Augustus had previously matured with a few private counsellors; and the comitia were still held, but only to elect candidates already nominated by the emperor. In this system of absolute dominion in the hands of a single individual, the Romans cheerfully acquiesced, partly from experience of the superior nature of the government thus exercised to the wretched anarchy from which they had escaped, and partly in consequence of the hopelessness of revolt against a man who had the entire military force of the Empire at his disposal. In Rome and Italy, the public peace was preserved by the *prætorian cohorts*—bodies of soldiers of tried valour, to whom Augustus gave double pay. Throughout the provinces, the people were kept in check by the regular troops, who were accumulated, however, principally in the frontier provinces of the Empire, where they might both maintain tranquillity among the recently-conquered populations, and resist the attacks of the barbarian races beyond. The provinces where military force was required, Augustus retained in his own hands, administering them through legates appointed by himself, usually for several years; the others he intrusted to the senate, who named governors for a single year.

The cities of the Empire were the centres of Roman influence. It was in them that the Roman citizens were congregated, that schools were established, and that the various agencies of civilisation operated most uniformly. In the rustic populations of the provinces, the national individuality was preserved with the national language. It was part of the policy of Augustus to found cities in the choicest situations in the provinces; and so rapid was the spread of the Roman civilisation during his reign, that Roman writers and orators of note began to be produced even in remote parts of the Empire. The Greek language and literature began also to penetrate the provinces of the West, and to find students among the Celts and Spaniards.

### THE SUCCESSORS OF AUGUSTUS—DISSEMINATION OF CHRISTIANITY—DIVISION OF THE EMPIRE.

During a period of nearly three centuries after the death of Augustus, the Empire remained, so far as political arrangements were concerned, pretty nearly as he had left it; and the history of Rome during these centuries is little more than an account of the personal

characters of the successive emperors. Some of these seem to have been specimens of the utmost depravity to which human nature could attain; others were men of great mind, and worthy of their station. At first, the Empire was inherited as a birthright by those who could claim descent from Augustus; but in the end, the real patrons of the sovereign dignity were the armies, and especially the prætorian cohorts. To raise favourite generals to the purple, and afterwards to murder them for the sake of the donations which it was customary to receive in the case of a new accession, became the pastime of the various armies; and sometimes it happened that there were several emperors at the same time, different armies throughout the Empire having each appointed one. The effect of these military appointments was to raise to the highest dignity of the state men born at a distance from Rome, and who, spending their lives in the camp, entertained no affection for the city of the Cæsars. Meanwhile, under all the emperors alike, the great family of nations incorporated under the Roman rule were daily advancing towards that condition out of which modern society was to arise. The reader, however, must imagine for himself the toil and bustle of the successive generations of Celts, Spaniards, Greeks, Africans, and Asiatics, who were born and buried during these three important centuries in which modern civilisation was cradled; all that we can give here is a chronological list of the emperors during that period:—

Augustus, - - - -	from 30 B. C. to	14 A. D.	37	...
Tiberius, - - - -	...	14	41	...
Caligula, - - - -	...	38	41	...
Claudius, - - - -	...	41	54	...
Nero, - - - -	...	54	68	...
Galba, Otho, Vitellius, - - - -	...	68	70	...
Vespasian, - - - -	...	70	79	...
Titus, - - - -	...	79	81	...
Domitian, - - - -	...	81	96	...
Nerva, - - - -	...	96	98	...
Trajan, - - - -	...	98	117	...
Hadrian, - - - -	...	117	138	...
Antoninus Pius, - - - -	...	138	161	...
Marcus Antoninus, - - - -	...	161	180	...
Commodus, - - - -	...	180	192	...
Pertinax, - - - -	...	193	...	...
Septimius Severus, - - - -	...	193	211	...
Caracalla, - - - -	...	211	217	...
Heliogabalus, - - - -	...	218	229	...
Alexander Severus, - - - -	...	229	235	...
Julius Maximinus, - - - -	...	235	238	...
Gordian, - - - -	...	238	243	...
Phillip, - - - -	...	243	249	...
Decius, - - - -	...	249	251	...
Gallus, - - - -	...	251	253	...
Valerian and Gallenus, - - - -	...	253	260	...
Gallenus, - - - -	...	261	268	...
Aurelius, - - - -	...	268	270	...
Aurelianus, - - - -	...	270	276	...
Tacitus, - - - -	...	276	276	...
Florian, - - - -	...	276	...	...
Probus, - - - -	...	276	282	...
Carus, - - - -	...	282	284	...
Diocletian and Maximian, - - - -	...	284	306	...

The only facts connected with the reigns of these emperors which need be noticed here are, that in the reign of Claudius, Britain was added to the Roman dominion; that under the great Trajan, the Empire was still farther extended; and that under Caracalla, the Roman franchise was extended to all the free inhabitants of the Empire. The vices of such emperors as Caligula, Nero, Commodus, Caracalla, and Heliogabalus, may pass unnoticed, as may also the military achievements of some of the later emperors. The reign of Diocletian, however (A. D. 284–305), constitutes an epoch in the history of the Empire. Finding the unwieldy mass too great for the administration of a single individual, he divided it between himself and his colleague Maximian, assigning to Maximian the western or Latin-speaking nations, and retaining the East in his own hands. Under each emperor there was to be a royal personage called Cæsar, who was to govern part of that emperor's section of the Empire, and afterwards succeed him in the chief dignity. This arrangement did not last long; and after various subdivisions of the

Empire, and struggles between emperors and Cæsars, the whole was reunited under Constantine the Great (A. D. 306-337). Under this remarkable man Christianity was established as the religion of the Empire.

During the three centuries which had elapsed between the crucifixion of Christ—which took place in the nineteenth year of the reign of Tiberius—and the accession of Constantine to the supreme government of the whole Empire, the new religion had been silently but surely spreading itself; first among the Jews, then among the Greeks or eastern, and lastly among the Latin or western Gentiles. It had been subjected to numerous persecutions, some local, and others general, over the whole Empire; but had, nevertheless, made such progress, that it is calculated that in Constantine's reign about a twentieth part of the whole population of the Empire were professed Christians, while even over the nineteen-twentieths who continued in polytheism, the indirect influence of Christianity had been immense. Led to embrace Christianity himself, although with a considerable tincture of polytheistic superstition, Constantine gave his imperial recognition to the already fully-organised ecclesiastical system of the Christians, with its churches, presbyters, bishops, and metropolitans. The civil ban having thus been removed from the profession of Christianity, it began to prevail in form, as it already did in fact, over the heterogeneous polytheism of the Empire.

Another important act of Constantine's reign, besides his proclamation of toleration for Christianity (A. D. 321), was his removal of the seat of empire from Rome to Constantinople. Not long after this was effected, Constantine died at the age of sixty, leaving the Empire divided among his three sons. One of them, Constantius, ultimately acquired the whole, and transmitted it to his successors; but in the year 395, Theodosius, one of these successors, effected a permanent separation between the East and the West. From that date, the history of Rome divides itself into two distinct histories—that of the Western or Latin, and that of the Eastern or Greek empire. The latter protracted its existence till A. D. 1453, when Constantinople was taken by the Turks: the former crumbled to pieces much earlier, before the attacks of the northern barbarians, who finally destroyed it in 476.

#### DOWNFALL OF THE WESTERN EMPIRE.

From an early period, the Empire had been assailed on its northern frontier by the German and Sclavonian races living east of the Rhine and north of the Danube. Partly by force, and partly by negotiation, the authorities of the Empire had been able to keep these barbarian populations in check; but towards the end of the fourth century, the growing decrepitude of the Empire tempted invasion, and hordes of barbarians from Scandinavia, Russia, and Tartary, rolled themselves towards the Danube. At first, it seemed as if the eastern empire would be the first to fall before them; but the tide of invasion was at length decisively diverted towards the west. Province after province was torn away by Goths, Alans, Huns, Vandals, and others: Italy itself was ravaged several times; and at length, A. D. 476, Romulus Augustulus, the last sovereign, was dethroned, and Italy became a prey to the Germans. The various steps in this gradual disintegration of the Empire, the heroic deeds of the two chief agents in the dismemberment—Alaric, king of the Goths, and Attila, king of the Huns—and the gradual formation of Romano-Germanic kingdoms out of fragments of the shattered Roman society, cannot here be detailed.

In the chaos into which the Western Empire was thrown by the Germanic invasions, three distinct elements were discernible—the old Roman or Romanised population; the Christian church; and the freshly-infused German vitality. By the interaction of these three elements, modern European society has been evolved; and to trace this evolution in France, England, Spain, Italy, &c. is the object of the succeeding number—THE HISTORY OF THE MIDDLE AGES.

#### ROMAN LITERATURE.

It has already been mentioned, that for the first five centuries of their existence as a people, the Romans possessed no literature. A great and conquering nation, and inheriting from their Etruscan progenitors a large share of the practical knowledge possessed by that singular people, it was not till they came in contact with the Greeks that the Romans began to develop their faculties in literary compositions; and then, as was natural, their first productions were translations from, or imitations of, Greek writers. Livius Andronicus and Cneius Nævius (B. C. 240), the earliest Roman poets, seem to have been copyists of the Greek; as were also Fabius Pictor and Cincius Alimentus, the first Roman annalists, and who lived during the Second Punic War. Between the Second Punic War, however (B. C. 202), and the dictatorship of Sulla (B. C. 81), there arose a number of writers of no ordinary power, in whose hands the Latin language acquired force and flexibility, and whose works illustrate the native character of the Romans. Among these should be mentioned Ennius, the father of Roman poetry; Plautus, his contemporary, a man of rich comic genius; the elder Cato, the first prose writer of note; and Terentius or Terence, a comic poet of a less rude style than Plautus, and whose first play was acted in the year B. C. 165.

The period from the dictatorship of Sulla (B. C. 81) to the death of Augustus (A. D. 14) is the golden age of Roman literature. Then flourished Cicero, undoubtedly the greatest as well as the most voluminous of Roman prose authors, whose orations and philosophical disquisitions are still read with pleasure; Cæsar, whose brief 'Commentaries' on his own campaigns are among the simplest and most compact of historical writings; his friend Sallustius or Sallust (born B. C. 68), who has left us spirited, if not unprejudiced, accounts of the Jugurthine War and the conspiracy of Catiline; the didactic poet Lucretius; his contemporary, Catullus, whose lyrical effusions are among the sweetest and most truly poetic things in the Latin language; and, not to mention a host of others, Virgil and Horace, the two chief classic poets of the Augustan age—the former the author of the celebrated epic poem the 'Æneid,' and if not an original, at least a graceful and pathetic writer; and the latter a sagacious and good-humoured observer of mankind, and the author of many odes, satires, and epistles. Somewhat later were Livy, the great historian of Rome, in 142 books, only thirty-five of which, however, have reached us; and Ovid, who ranks second to none of the Roman poets for ease and elegance.

Under the emperors, the Latin authors became more and more numerous, springing up in all parts of the Empire, and cultivating all departments. Out of the long list of authors intervening between the reign of Tiberius and that of Commodus, we may mention the poets Itallius, Lucan, and Silius Italicus; Martial, the writer of epigrams; Seneca, the Stoic philosopher, put to death by Nero; Quintilian the rhetorician; Pliny, the celebrated natural historian, who was killed A. D. 79 by the great eruption from Vesuvius which destroyed the city of Herculaneum; Tacitus, the historian of the declining age of Rome; and Juvenal, whose satires reveal too horribly the immorality of the society in the midst of which he lived.

The host of petty rhetoricians, poets, &c. both Greek and Roman, who lived in the various cities of the Empire in the second, third, and fourth centuries, may be passed over. During these centuries Christianity was overspreading the Empire, and drinking-up all the intellect and enthusiasm of the various nations; and nothing more strikingly marks the decrepitude of polytheism at that time, as compared with the freshness of the new religion, than the contrast between the miserable verse-making, which seemed to be the only literary occupation practised in polytheistic circles, and the earnest and powerful writings of the Christian fathers on those great theological topics which concerned the Divine nature and the everlasting destinies of man.

# HISTORY OF THE MIDDLE AGES.

UNDER the title of the Middle Ages is comprehended that period of history which succeeded the destruction of the Roman western empire (see preceding sheet), and extended to the end of the fifteenth or beginning of the sixteenth century, when learning was revived in Europe. This period of about eight hundred years may be said to divide ancient from modern times. The early portion of the middle ages is sometimes styled the Dark Ages; for during this time the ancient civilisation of Rome, a bequest from Egypt and Greece, disappeared, and ancient institutions perished, without anything better being substituted. The middle ages altogether differ from any other period in history. They may be generally described as an era of universal disorder, in which was maintained a struggle between force and reason. Old governments were broken up, and new ones took their place, only to be dismembered in turn. Literature sunk into obscurity, and was confined to the cells of monks. Slavery was universal, and was modified alone by the benign influence of Christianity. Gradually, as it will be seen, nations assumed a settled character, arts were discovered, and for military turbulence were substituted peaceful institutions. Much, therefore, as there is to deplore in the history of the middle ages, there is not a little to commend and be grateful for. We must view these ages as being the cradle of modern civilisation, the era whence sprung much that we venerate in our institutions, much that distinguishes modern from ancient manners.

## THE EASTERN EMPIRE TO THE TWELFTH CENTURY.

It is necessary to begin a history of the middle ages with a reference to the decline of the Roman Empire. This decline was caused by various circumstances, but chiefly by the weakened condition of society. Instead of rearing a respectable lower and middle class, the Roman aristocracy kept the mass of the people in slavery, so that at length society consisted of but a comparatively small number of privileged persons, including the military, and vast numbers of serfs or slaves—the hangers-on of great men—and in effect paupers. ‘The freedom of the ancient world expired in the course of ages,’ says Alison, ‘from the small number of those who enjoyed its benefits. The ruling citizens became corrupted from the influence of prosperity, or by the seductions of wealth; and no infusion of energy took place from the lower ranks to renovate their strength or supply their place.’ Besides this general, there was a special cause. In 321, Constantine transferred the imperial abode from Rome to Byzantium, a city situated on the Bosphorus, and afterwards

called Constantinople. In his endeavours to make this city the seat of government, Constantine only partially succeeded; for it generally happened after his day that there was one emperor in the East and another in the West, and not unfrequently two or three different individuals in the provinces, at the head of considerable military forces, claiming partial and even universal empire. Rome itself, and the countries of western Europe, were soon taken possession of by barbarous intruders, and lost all the characteristics and individuality of empire; but Constantinople continued for a thousand years the abode of men who had still the name of emperors, and reckoned themselves the descendants of the Cæsars, although they had long ceased to wield anything but the shadow of power. Constantine was himself instrumental in dismembering his empire, having before his death divided it among no fewer than five individuals—namely, his three sons, Constantine, Constans, and Constantius, and his two nephews, Dalmatius and Annibalianus, both of whom bore in addition the surname of Cæsar—a name still popular among a people who wished themselves to be considered Roman.

Constantine II. soon fell a sacrifice to the cruelty and ambition of his brother Constans, who in his turn lost his life in attempting to quell a revolt among his subjects; and Constantius, the youngest of the sons, having found means to destroy the two Cæsars, and five other cousins, and two uncles, found himself at an early period of life the undisputed master of the empire. He reigned twenty-four years, but left no monuments of goodness or of greatness, having wasted his time in the practice of vice, or in the equally unprofitable, if more innocent, employment of disputing with bishops on the abstrusest points of doctrinal theology; while a host of enemies, apparently from every side of his dominions, were engaged in undermining and laying waste the empire. It was in the West that these attacks were first made, though perhaps it was in the East that they were fiercest. Numberless and powerful barbarians now began to pour unceasingly upon Gaul, Spain, and latterly upon Italy itself, from the forests of the north, and in particular from those of Germany—a country whose inhabitants have been remarkable in the history of the world, both as having originated many of the greatest movements in society, and as having laid open more of the sources of human thought than any other people that could be named. The Franks, Saxons, Goths, and Alemanni, devastated the fine countries watered by the Rhine, and so effectually severed them from the Empire, that from this period their history becomes wholly separate. At the same time the Sarmatians, Persians, Scythians, and others, made dreadful incursions in the East. All that Constantius could do to stem this powerful tide was to raise his kinman Julian, whom he surnamed Cæsar, to command in the army.

Julian had been early instructed in the Christian religion, but he is not known to have ever given it any credit, although he has been often called apostate. He had imbibed the philosophy of Plato in the schools of Athens; and with this learning, with the elements of a great character in his mind, and with the models of Cæsar, of Trajan, and of Marcus Antoninus in his eye, he formed the design, and seemed to have the ability, to raise up and consolidate the glories of the falling Empire. His victories over the Alemanni in Gaul, although they preserved the Empire, excited only the envy of the emperor, and Constantius was about to depose him from his command, when his own death saved him from the ignominy to which the soldiery would certainly have subjected him for any attempt to de-

grade their favourite commander. Julian was himself declared emperor by the army, and the people had lost both the power and the will to resist. Unfortunately for his fame, Julian perished in battle with the Persians only three years after his accession. In that short period he had reformed many abuses in the state; and though personally hostile to the Christian religion, and though he used both arguments and ridicule against it, he not only advocated, but practised universal toleration. It is creditable also to Julian, that in establishing the ancient orders of Roman priesthood, he was at pains to enforce a strict morality in all the relations of life. He was succeeded, after the fall of several candidates, by Valentinian, whose father had been a soldier from the Danube. This emperor took for colleague his brother Valens, to whom he assigned Constantinople and the government of the East. The reign of Valens was signalled by the irruption into Europe of an enemy till then unknown to the Romans; these were the *Huns*, a confederation of Tartar tribes, some of whom had obtained the ascendancy and control over the rest, and led them on to invade the nations of Europe. Their numbers and ferocity led the ancient writers to describe them in terms of consternation, which to moderns, who are no strangers to Calmucs, Cossacks, Tartars, and other tribes of similar origin, appear sufficiently ludicrous. They never lived in houses, slept under trees, ate raw flesh, and were altogether superior in war even to the Goths, who were now in alliance with the Romans, and had begun to relish the comforts of a settled life. They were, therefore, driven away before the Huns, and were forced, in search of a home, to invade the Roman territory. Here they were opposed by the Emperor Valens; but they defeated his army, and made his own life a sacrifice. He was succeeded by his nephew Gratian, who chose for his colleague Theodosius, a general of talents and celebrity. This emperor restored the confidence of his own army, and broke the power of the Goths, by his skill and caution; and was the first of the emperors who practised the mode of dividing the barbarians against one another, by giving money to such of their tribes as he imagined would make useful auxiliaries. This system, which the wealth of the emperors (from their possession of all the maritime and trading cities) enabled them long to use against their poorer enemies, often saved the Empire at the expense of its dignity; for though the money was given at first as a gratuity, it was sometimes demanded in times of weakness as a tribute. This Theodosius (commonly called the Great) was the first who made Christianity the established religion of the Empire (390). He procured a senatorial edict in favour of the Christians and their religion, sanctioned the destruction of the heathen temples, and forbade the performance of sacrifices, either in public or private. The Empire under this prince still preserved its original extent; but he divided it between his two sons, Arcadius and Honorius (394), and its parts were never afterwards reunited.

From the death of Theodosius II. (449) to the reign of Justinian (527), the Eastern Empire continued without any considerable alteration, though there were many changes and intrigues in the court and army. The reign of the latter prince is memorable on several accounts: it was under his auspices that a knowledge of the silk manufacture was first brought to Europe, where it gave employment to much ingenious industry (900). Justinian also caused certain eminent lawyers to prepare a code of laws, and an abridgment of law decisions, &c. called the *Pandects*, which were used by all his successors, and have been adopted as the basis of their laws by several countries of Europe. With the single exception of the *Code de Napoleon*, these form the only complete and perfect abstract of national law which any government has given to its people (see No. 54). Whatever may have been Justinian's errors, his having projected this work, and procured so many able ministers to execute it, must redound for ever to his honour. The talents and virtues of his general Beli-

sarius regained to the Empire Africa and great part of Italy, from the Vandals and Ostrogoths; this conquest, however, only prevented the latter region from being united under one government, and has been the cause of its remaining a feeble and divided country ever since. In the reign of Tiberius shortly after (580), the people of Rome, though they intreated with great earnestness the aid and pity of the emperor, who now claimed to rule over them, were unable to obtain any relief, and remained distracted between their attachment to the ancient head of the Empire, and the claims of his enemies who occupied the rest of Italy.

The next emperor who merits attention is Heraclius (610), a native of Africa. The Eastern Empire had till now preserved its ancient boundaries in their full extent, and was mistress of Carthage, Egypt, Syria, and Asia Minor, besides Greece, and the countries on the Danube. The Roman armies on the eastern frontier had, however, been lately driven in by Chosroes, king of Persia, who now occupied all the north of Africa and Syria. This was the first great violation of their territory sustained by the emperors of Constantinople; and Heraclius avenged it with a celerity and effect which made the Persians tremble. His triumph, however, was short, for the latter part of his reign was disturbed by the rise and victories of Mohammed. The successors of this signal impostor, after breaking the power of Persia (already weakened by the victories of Heraclius), immediately attacked the Roman Empire; then defeated its armies in two battles, occupied all Syria, and obliged the emperor (now an old man) to retire to Constantinople. He died in 641.

The continued victories of the followers of Mohammed (called Arabs or Saracens) soon deprived the Empire of Egypt, Africa, and Syria; and in 668 they followed up their success by attacking Constantinople itself. The city sustained two sieges, in the first of which the Saracens were encamped in its neighbourhood, and carried on the operations of a siege at intervals, for seven years; and in the second, for nearly two. In both the Saracens wasted immense resources ineffectually.

The Empire had now lost all its provinces eastward of Mount Taurus, and the cities of Alexandria, Jerusalem, and Antioch, were in the hands of the Mohammedans. There was little further change in its condition till the year 867, under the Emperor Basil, who gave new vigour both to the internal administration and to the military resources of the government. This prince, and his immediate predecessor Zimisce, made the Roman arms—for they still wished to be called Romans—respected on the Euphrates and Tigris, and asserted the ancient warlike reputation and boundaries of the Empire. They were now, however, deprived of the resources they had enjoyed in the secure possession of the great commercial cities of the Mediterranean—Alexandria, Carthage, Cesarea, &c.; and the trade and revenues of those which remained were crippled and diminished, from the want of that free general intercourse which had existed when they were all under one government. Hence the armies were maintained with greater difficulty, and any victories that were gained could not be followed up with effect. The early enemies of the Empire—the Goths, Vandals, and Huns—had now settled into civilised communities, and were no longer formidable. The foes with whom it contended latterly were the Bulgarians and Seljukian Turks; the former of whom were rather troublesome than dangerous, but the latter, who had succeeded the Saracens in the dominion of Asia, aimed at nothing short of the destruction of the Roman name. They succeeded at last by defeating and taking prisoner the Emperor Romanus Diogenes, in tearing away almost the whole province of Asia Minor (1099); so that the emperors were now confined to their dominions in Europe, which, however, still formed a monarchy not much smaller than France or Spain.

The manners of the court of Constantinople during much of this period were dissolute and corrupt. We are told of one emperor who ordered a plate of human

noses to be brought to his table; another was accustomed to seize the deputies of cities whose tribute was in arrear, and suspend them with their heads downwards over a slow fire; a third got up farces in mockery of the ceremonies of religion; and, in general, the appointment of officers, and even the succession to the Empire (where it was not seized by some successful general), was in the hands of the women and eunuchs of the palace. The cities and provinces generally acquiesced as to the choice of an emperor in the decision of the capital or army; this circumstance shows that the laws were attended to, and that there was a regular system of government, which was not much disturbed by the personal character of the reigning prince. The countries of Greece, however, which had formerly been the seat of knowledge and the arts, were now sunk in ignorance; and the little learning that was cultivated in Athens was only scholastic divinity, or the pedantry of law and grammar. There is no scholar, or philosopher, or poet of the empire of Constantinople who is generally known to posterity.

A great change took place in the relations of the Empire after the eleventh century. It was still pressed by the Turks on the East, who now occupied Asia Minor, and were only separated from Constantinople by the Hellespont; while in Europe its territories were disturbed by the incursions of certain Norman adventurers who had settled in Sicily. Against these enemies the Emperor Claudius Comnenus, an active prince, and full of resources, made all the resistance which his diminished revenues allowed. He applied to the Christian sovereigns of Europe to aid him in expelling the Mohammedans from the territories of the Empire, but above all, to drive out the Turks from the land of Judea, which they occupied and profaned, and where they harassed the Christian pilgrims who desired to visit the scenes of Scripture history. His appeal was received in Europe at a time when many concurring causes had brought the mass of the people to a state of uneasiness which at once foreboded and rendered necessary some extensive change in their condition. Countrymen of their own, pilgrims from the shrine of the tomb of Christ, had returned and filled them with horror by a recital of indignities which Turkish infidels were casting on those scenes and subjects with which their own most sacred feelings were associated; and the result was that extraordinary outpouring of the inhabitants of Europe upon Asia, which has been termed the Crusades, and to which we shall afterwards advert.

#### ARABIA—MOHAMMED—EMPIRE OF THE SARACENS.

It was not before the sixth century that Arabia became peculiarly remarkable in the history of the world. The wild Arabs, as they have been generally called, had already signalled themselves by incursions on the Empire of the East, when Mohammed was born, in the year 569 (some say, 571) of the Christian era at Mecca, the principal city of their country. He is said to have been descended from some great families; but it is certain that his immediate progenitors were poor, and he had little education but what his own means and his own mind could give him. Yet this man became the founder of a great empire, and the fabricator of a religion which has continued to our own day to affect greater numbers of mankind than Christianity itself. At an early period of life, we are told, 'he retired to the desert, and pretended to hold conferences with the Angel Gabriel, who delivered to him, from time to time, portions of a sacred book or Koran, containing revelations of the will of the Supreme Being, and of the doctrines which he required his prophet (that is, Mohammed himself) to communicate to the world.' The Mohammedan religion, as the so-called revelations of this great impostor have since been designated, was a strange mixture of the superstitions of Arabia, the morality of Christ, and the rites of Judaism. It was to this happy mixture of tenets, usages, and traditions already existing among his countrymen, and to the applicability of the precepts of the Koran to all legal transactions and

all the business of life, that Mohammed seems to have owed his extraordinary success. Others, indeed, have attributed this to certain indulgences allowed in the Koran; but in reality these indulgences existed before, and the book breathes upon the whole an austere spirit. This extraordinary work inculcated elevated notions of the Divine nature and of moral duties: it taught that God's will and power were constantly exerted towards the happiness of His creatures, and that the duty of man was to love his neighbours, assist the poor, protect the injured, to be humane to inferior animals, and to pray seven times a day. It taught that, to revive the impression of those laws which God had engraven originally in the hearts of men, He had sent his prophets upon earth—Abraham, Moses, Jesus Christ, and Mohammed—the last, the greatest, to whom all the world should owe its conversion to the true religion. By producing the Koran in detached parcels, Mohammed had it in his power to solve all objections by new revelations. It was only after he was well advanced in years that his doctrines began to be received. At first, indeed, they were so violently opposed by his fellow-citizens of Mecca, that the prophet was obliged to flee from the city to save his life. This event is called by his followers *Hegyra*, or the Flight: it occurred in the 622d year of the Christian era; and they reckon dates from it as we do from the birth of Christ (see CHRONOLOGY, Vol. I.). Mohammed took refuge in the city of Medina, and by the aid of his disciples there, he was soon able to return to Mecca at the head of an armed force. This enabled him to subdue those who would not be convinced; and henceforward he proceeded to make proselytes and subjects together, till at length, being master of all Arabia and of Syria, his numerous followers saluted him king (627). This extraordinary man died suddenly, and in the midst of successes, at the age of sixty-one (632). Abubeker, his father-in-law and successor, united and published the books of the Koran, and continued and extended the empire which Mohammed had left him (see MOHAMMEDANISM, No. 76).

A more powerful caliph (such was the title given to this series of monarchs) was Omar, the successor of Abubeker (635). Barbarity, ferocity, and superstition seem to have been mingled and to have reached their height in the person of Omar. It was by his order that the most magnificent library of antiquity, that of Alexandria, consisting of 700,000 volumes, was burned to ashes. The reason which he gave for this act is worth preserving:—'If these writings,' he said, 'agree with the Koran, they are useless, and need not be preserved; if they disagree, they are pernicious, and ought to be destroyed.' By himself and his generals this ferocious conqueror added Syria, Phœnicia, Mesopotamia, Chaldea, Egypt, Lybia, and Numidia, to his empire. Next came Otman, and then Ali, the son-in-law of Mohammed himself. The name of Ali is still revered by Mussulmans. His reign was short, but glorious. 'After some internal troubles,' says Hallam, 'the Saracens won their way along the coast of Africa, as far as the pillars of Hercules, and a third province was irretrievably torn from the Greek empire. These Western conquests introduced them to fresh enemies, and ushered in more splendid successes. Encouraged by the disunion of the Visigoths [in Spain], and invited by treachery, Muza, the general of a master who sat beyond the opposite extremity of the Mediterranean Sea, passed over into Spain, and within about two years the name of Mohammed was invoked under the Pyreneans.'

Nineteen caliphs of the race of Omar succeeded Ali, and after these came the dynasty of the Abassides, descended by the male line from Mohammed. The second caliph of this race, named Almansor, removed the seat of empire to Bagdad (762), and introduced learning and the culture of the sciences, which his successors continued to promote with zeal and liberality. This was some recompense for those indignities which had been cast upon literature by the brutal Omar. Perhaps the obligations of modern Europe to Arabia at this time have been overstated; but it is not to be denied that

learning, almost totally excluded, and extinct in Europe during the eighth and ninth centuries, found an asylum here. It has been matter of dispute how the tastes of these fierce Arabians became thus first directed. They probably owed it to the Greeks; but it is certain that what they got they returned with interest. We are said to derive our present arithmetical figures from this strange people; and geometry, astronomy, and alchemy were their favourite pursuits. The graces of light literature were not neglected, as is shown by the *One Thousand and One Nights'* Entertainments, a production of this period, which still continues to solace the hours of childhood and old age among ourselves, and attests the extent of fancy and the variety of genius among those that gave it birth. Haroun al Raschid, who flourished in the beginning of the ninth century, is celebrated as a second Augustus. He was contemporary with Charlemagne, and communications of a friendly nature are said to have passed between them.

Within fifty years from the death of Mohammed, the Saracens had raised an empire, not only temporal, but also spiritual, more extensive and more powerful than what remained of the empire of Constantinople; and within a hundred, they had subdued not only Persia, Syria, Asia Minor, and Arabia, but also Egypt, North Africa, and Spain. It seemed, indeed, in the course of the eighth century, as if Asia and Europe both should yield to their victorious arms, and become one great Mohammedan dominion. But the mighty fabric, of mushroom growth, crumbled into dust with equal speed. After the first extension of their conquests, they ceased to acknowledge any one head of their empire, and the successful generals of the provinces contented themselves by paying a religious respect to the caliphs of Bagdat, as the successors of the prophet, while they retained the power of conquerors for themselves. In the year 732 they sustained a great defeat in France from Charles Martel, who became the father of an illustrious race of kings. No fewer than 375,000 Saracens are said to have been left dead on the field of this battle, and it is certain that they never after cherished the hope of subduing Europe. About the middle of the ninth century (848), they projected the conquest of Italy, and even laid siege to Rome itself. But they were entirely repulsed by Pope Leo IV.; their ships were dispersed by a storm, and their army cut to pieces. Spain was the only European country in which they were able to obtain a permanent footing, and in it alone have they left traces of their existence.

#### FROM THE DESTRUCTION OF ROME TO THE AGE OF CHARLEMAGNE—ORIGIN OF THE FEUDAL SYSTEM.

The Empire of the Cæsars fell in the West only by degrees, and the changes introduced by the northern tribes were gradual, though they proved great. Province after province yielded to the invaders; and before the end of the fifth century, every country in Europe had undergone extensive changes, and received fresh accessions to the number of its inhabitants. The Visigoths had seated themselves in Spain, the Franks in Gaul, the Saxons in the Roman provinces of South Britain, the Huns in Pannonia, and the Ostrogoths in Italy and the adjacent provinces. And not only had they been enabled to take up their abode, but in general they became masters, and changed the face of all that they touched: 'new governments, laws, languages; new manners, customs, dresses; new names of men and of countries, prevailed; and an almost total change took place in the state of Europe.' That change has been called a change from light to darkness, and it assuredly led to the extinction of that taste for literature and that regular administration of government which were the relieving features of the Roman despotism. But if it thus produced an immediate evil, it led to an ultimate good. The population was reinvigorated by the admixture of the new races, and from the fresh elements it had acquired there sprung institutions which might be considered as in many respects an improvement upon those that formerly prevailed,

It was out of these new circumstances that what has been called the Feudal System took its rise. This was a feature in society unknown in former ages. Hitherto men had been the slaves of individual masters, or, as in the more celebrated states of antiquity, they were bound together by the common tie of citizenship, and owed allegiance to none. Patriotism was their highest virtue, and all looked upon the state as a parent, to which, having got support from it, they were bound to give support in their turn. But in these times the rude inhabitants of the north had formed little or no conception of what a state was, and at first they were not prepared to relinquish their much-cherished individual freedom in exchange for rights which they thought they did not need. Changes at length came over them; and society gradually took new forms. Those who had led them on to battle, began to be looked upon as their guardians in peace. Victorious armies, cantoned out into the countries which they had seized, continued arranged under their officers, each of whom had a separate territory allotted to him, on which he could retain and support his immediate followers, while the principal leader had the largest; and in this way all were bound in allegiance, both to their immediate superiors and to their chief, and all were in readiness to be called out to arms whenever their services were thought to be required. This 'military chieftainship,' infusing itself as an element in the barbarian societies, was the first advance to anything like civil or social government since the extinction of the Roman power. Nations, indeed, were still far from having the advantage of a regular government. The method of conducting judicial proceedings, and of administering justice, was still peculiarly unsettled and uncertain. The authority of the magistrate was so limited, and the independence assumed by individuals so great, that they seldom admitted any umpire but the sword. It was then that trial by ordeal became universal, and men's guilt or innocence was thought to be proved by the capacity of their bodies to withstand the influences of red-hot iron or boiling water applied to them, or by their overcoming their accuser in single combat.

These observations are applicable, with scarcely any variation, to all the nations which settled in Europe during the fifth and sixth centuries. Speaking of this subject, Dr Robertson says—'Though the barbarous nations which framed it [the Feudal System], settled in their new territories at different times, came from different countries, spoke various languages, and were under the command of separate leaders, the feudal policy and laws were established, with little variation, in every kingdom of Europe. This amazing uniformity hath induced some authors to believe that all these nations, notwithstanding so many apparent circumstances of distinction, were originally the same people. But it may be ascribed, with greater probability, to the similar state of society and of manners to which they were accustomed in their native countries, and to the similar situation in which they found themselves on taking possession of their new domains.' We shall now offer a few remarks respecting them individually.

No people at this period exhibited a more energetic character than the Franks, a Teutonic race originally settled on the Lower Rhine and Weser, and who had acquired their name (freemen) while successfully resisting the Roman power in an earlier age. About the year 486, they were under the rule of Clovis, who achieved the conquest of Gaul by the defeat of the Roman governor, and afterwards added Burgundy and Aquitaine to his dominions—the former by marriage, and the latter by the forcible expulsion of the Visigoths. This may be considered as the foundation of the French monarchy. Clovis adopted the Christian faith, and caused his people to follow his example. It is remarkable that while in war he exercised unlimited power over his subjects, they shared with him the legislative authority, meeting annually in the Champs de Mars to suggest and deliberate upon public measures, in the

settlement of which the meanest soldier had equally a voice with his sovereign.

At the death of Clovis in 511, his four sons divided the kingdom, which was afterwards reunited, divided again, and again united, amidst scenes of tumult and bloodshed. The line of kings proceeding from Clovis (called Merovingian from his grandsire Meroveus) dwindled in time into utter insignificance, while the chief power was wielded by an important officer, called the Mayor of the Palace. Among the most remarkable of these was Pepin Heristal, Duke of Austrasia, who ruled France for thirty years with great wisdom and good policy. His son, Charles Martel, who succeeded to his power, distinguished himself by that great victory over the Saracens (A. D. 732), which checked their career in Europe.

An appeal by Pepin le Bref, the son of Charles Martel, to the pope of Rome, whose authority had by this time become great, ruled that he who had the power should also have the title of king, and this put an end to the reign of the descendants of Clovis (752). Pepin remunerated the pope for this service by turning his arms against the Lombards in Italy, some of whose dominions he conferred upon the Holy See; and these, it is said, were the first of the temporal possessions of the church. Pepin died (768), leaving two sons, Carloman and Charles, who succeeded him in the empire. Carloman died at an early period of life, but Charles (subsequently Charlemagne) survived to achieve for himself a fame far greater than that of any other individual during the middle ages, with perhaps the single exception of Mohammed. We shall proceed to speak of him and of his times, after making one or two observations on some other European countries.

Spain was among the earliest countries lost to the Roman Empire. From about the year 406, this country, in whole or in part, had been successively invaded and subdued by Sueri, Alans, Vandals, and Visigoths. The last-named people were in possession of the greater part of the country before the year 585, and erected a monarchy which existed till 712, when they were subdued by the Saracens or Moors. The Saracens made their descent on Spain from Africa, where Muza, a viceroy of the caliph of Bagdat, had already made extensive conquests. They easily overran Spain and vanquished Don Rodrigo, or Roderic, the last of the Gothic kings. Abdallah, son of Muza, married the widow of Roderic, and the two nations entered into union. Before the conclusion of the eighth century, Abdalrahman, one of the Moorish generals, had laid aside all temporal subjection to the caliph of Bagdat, and formed Spain into an independent kingdom. His residence was at Cordova, and this city became renowned as one of the most enlightened in Europe under several succeeding reigns. Those parts of Spain which were under the Moorish kings embraced also their religion. The northern provinces never owned their dominion.

Towards the conclusion of the sixth century, Italy was in the possession of the Longobards, or Lombards, who continued masters of the greater part of it for two centuries. Of their rule, history has recorded little besides murders and confusion.

It was during this period that the Saxon Heptarchy was formed in Britain (see No. 59).

#### CHARLEMAGNE—THE NEW WESTERN EMPIRE.

By far the greatest character who appeared in Europe at this period was Charles, the son of Pepin le Bref, and known in history by the name of Charlemagne, or Charles the Great. 'In the course of a reign of forty-five years,' says Mr Tytler, 'Charlemagne extended the limits of his empire beyond the Danube, subdued Dacia, Dalmatia, and Istria, conquered and subjected all the barbarous tribes to the banks of the Vistula, made himself master of a great portion of Italy, and successfully encountered the arms of the Saracens, the Huns, the Bulgarians, and the Saxons. His war with the Saxons was of thirty years' duration; and their final conquest was not achieved without an inhuman

waste of blood. At the request of the pope, and to discharge the obligations of his father Pepin to the holy see, Charlemagne, though allied by marriage to Desiderius, king of the Lombards, dispossessed that prince of all his dominions, and put a final period to the Lombard dominion in Italy (774).'

When Charlemagne made his first entry into Rome, he was crowned King of France and of the Lombards by Pope Adrian I.; and afterwards, on a second visit, he was consecrated Emperor of the West by the hands of Pope Leo III. (800). He probably attached some importance to these rites; but it is to be remarked that, as yet, the pontiff was not in the enjoyment of that high influence by which he afterwards could confer or withdraw sovereignty at his pleasure.

'It is probable,' continues the authority above quoted, 'that had Charlemagne chosen Rome for his residence and seat of government, and at his death transmitted to his successor an undivided dominion, that great but fallen empire might have once more been restored to lustre and respect; but Charlemagne had no fixed capital, and he divided, even in his lifetime, his dominions among his children (806).' Charlemagne died in the year 814, aged seventy-two. His last days were employed in consolidating, rather than extending, his empire, by the making of laws which have rendered his name famous, and his memory even blessed. 'Though engaged in so many wars,' says Dr Russell, 'Charlemagne was far from neglecting the arts of peace, the happiness of his subjects, or the cultivation of his own mind. Government, manners, religion, and letters, were his constant pursuits. He frequently convened the national assemblies for regulating the affairs both of church and state. In these assemblies he proposed such laws as he considered to be of public benefit, and allowed the same liberty to others; but of this liberty, indeed, it would have been difficult to deprive the French nobles, who had been accustomed, from the foundation of the monarchy, to share the legislation with their sovereign. His attention extended even to the most distant corners of his empire, and to all ranks of men. He manifested a particular regard for the common people, and studied their ease and advantage. The same love of mankind led him to repair and form public roads; to build bridges where necessary; to make rivers navigable for the purposes of commerce; and to project that grand canal which would have opened a communication between the German Ocean and the Black Sea, by uniting the Danube and the Rhine.' Amidst all his greatness, his personal habits were simple; his dress was of the plainest sort, and such even as to shame his own courtiers; his hours of study were set apart, and seldom omitted even in the busiest times of his life; his daughters were taught spinning and housewifery, and his sons trained by himself in all the accomplishments of the age. Charlemagne was fond of the company of learned men, and greatly encouraged their residence in his dominions. In this respect he resembled his contemporary Haroun al Raschid, so famous in Arabian history, and Alfred the Great, who appeared in England shortly after this period. Superior to all national prejudice, he elevated an Englishman named Alcuin to the head of his royal academy. He was zealous for the extension of Christianity; and one of the few blots upon his name arises from his having, in the spirit of his age, caused 4000 Saxon prisoners to be beheaded in one day, because they would not submit to be baptized. Charlemagne established schools in the cathedrals and principal abbeys, for the teaching of writing, arithmetic, grammar, logic, and music.

Of the sons of Charlemagne, Louis, the youngest, surnamed the *Débonnaire*, or gentle, was the only one who survived. He succeeded to all his father's dominions, except Italy, which fell into the hands of Bernard, a grandson of Charlemagne. Louis, deficient in vigour of character, was unable to hold together the great empire left to him by his father. Having, among the first acts of his reign, given large portions of it to

his children, the remainder of his life was spent in disgraceful quarrels with them; and after his death (840), the empire was formally divided—Lothaire, his eldest son, obtaining Lorraine and Provence; while Charles the Bald, a younger son, continued sovereign of the western parts of France; and Louis became king of Germany. Thus abruptly terminates the history of the second western empire.

FRANCE FROM THE TIME OF CHARLES THE BALD TO THE ELEVENTH CENTURY.

During the reign of Charles the Bald, France first suffered from the attacks of the Normans, a race of bold and needy adventurers from the north of Europe. Their plundering invasions were continued for upwards of seventy years; till at length (912) the French king was compelled to purchase their amity by yielding to Rollo their leader the country afterwards from them called Normandy, of which Rouen was the capital. The first successor of Charles the Bald with whose name history has associated anything worth remembering, was Charles, surnamed the Fat (885). He was the son of that Louis to whom Germany had been before assigned, and was thus enabled to bring that country and France for a short time once more under a single ruler. In the turbulence of the times Charles was soon deposed; and during the century which followed, France, so lately the centre of an empire little less than that of Rome in the days of its Caesars, was split up into a multitude of independencies, by nobles who would own only a very slender subjection to the kings. Out of these nobles at last sprang Hugh Capet (987), who was enabled, on the death of Louis V., to place himself on the throne. He was already possessed of great property, and proved to be also a prince of much ability and penetration. He established the royal residence at Paris, which his predecessors had deserted, and became the founder of a family which, in one of its branches, occupied the throne of France till the overthrow of monarchy in 1848. He deserves to be mentioned with honour, as being among the first of European kings who trusted to prudence, counsel, and moderation, rather than force of arms, in effecting his purposes. On his death (996), in the fifty-seventh year of his age and the tenth of his reign, he was succeeded by his son Robert, who had all his father's equitable disposition without his vigour of character. He was subjected to a degree of tyranny on the part of the church of which perhaps the history of the world does not afford such another example. Robert had been guilty of marrying a cousin in the fourth degree without a *dispensation* from the Holy See—that is, without paying a fine for what was only an imaginary offence. Gregory V., who then occupied the pontifical chair, threatened to excommunicate Robert if he should not dismiss his wife, and, on Robert's refusal, actually did so, and laid all his dominions under an interdict. This punishment proved tremendous in its effects; for though the king himself showed sense and courage enough to despise the wrath of the pontiff, yet his subjects deserted him in terror. The priests, in consequence of the interdict, refused sacrament to the sick all over the country, and the dead were everywhere left unburied, when mass was no longer said. In these circumstances the unfortunate king submitted. A second marriage, contracted with the consent of the church, proved very unhappy. The new queen, Constantia, or Constance, made many efforts to embroil her husband and his family, and in the midst of these Robert died (1031). His son Henry succeeded, and it was during his reign that those pilgrimages to the Holy Land, which were so soon to end in the Crusades, took their rise. Of these we shall speak by themselves. In the meantime we take leave of France by mentioning that Henry's successor was Philip (1060), whose reign is remarkable as having witnessed the beginning of those contests with England which continued at intervals till the early part of the nineteenth century.

At this period (1066) the Normans invaded and

conquered England, where their leader, William, Duke of Normandy, became—as detailed in a subsequent number—the founder of an important dynasty.

THE GERMAN EMPIRE TILL THE ELEVENTH CENTURY.

Germany had no political existence till the time of Charlemagne, when it was formed by him into a part of the western empire. Towards the conclusion of the ninth century it became an empire of itself. In the year 887, Arnold, a natural son of Carloman, and nephew of Charles the Fat, was declared emperor by an assembly of bishops and nobles. These assemblies in Germany always retained a voice in the election of their emperors; and though they often made their choice from the line of succession, they never acknowledged any hereditary rights whatever. After the death of Arnold's son, called Louis III., their choice fell upon Conrad, Duke of Franconia (912). Conrad's successor was Henry I., surnamed the *Fowler*. He was a prince of great abilities, and introduced order and good government into the empire. 'He united the grandees and curbed their usurpations; built, embellished, and fortified cities; and enforced with great rigour the execution of the laws in the repression of all enormities. He had been consecrated by his own bishops, and maintained no correspondence with the see of Rome. His son, Otho the Great, who succeeded him (936), united Italy to the Empire, and kept the popedom in complete subjection. He made Denmark tributary to the imperial crown, annexed the crown of Bohemia to his own dominions, and seemed to aim at a paramount authority over all the sovereigms of Europe.'

In these times the papacy was much disordered. 'Formosus, twice excommunicated by Pope John VIII., had himself arrived at the triple crown. On his death, his rival, Pope Stephen VII., caused his body to be dug out of the grave, and after trial for his crimes, condemned it to be flung into the Tiber. The friends of Formosus fished up the corpse, and had interest to procure the deposition of Stephen, who was strangled in prison. A succeeding pope, Sergius III., again dug up the ill-fated carcase, and once more threw it into the river. Two infamous women, Marrosia and Theodora, managed the popedom for many years, and filled the chair of St Peter with their own gallants or their adulterous offspring.'—*Tytler*. It was amidst this confusion and these disturbances that Otho was induced to turn his arms on Italy. He shortly became master of it all, and had himself declared emperor by the Holy See, with all the pomp that had attended the same ceremony to Charlemagne (962). Pope John XII., whom Otho had been the means of raising to the pontifical chair, rebelled soon after. Otho returned to Rome in fury, had John deposed, hanged one-half of the senate before he left the city, and wrung a solemn acknowledgment from an assembly of reluctant bishops, that the emperor had a right not only to nominate to vacant bishoprics, but also to elect the pope himself. Otho died (972), and was followed in succession by Otho II., Otho III., St Henry, Conrad II., and Henry III., the history of whose reigns exhibits nothing instructive, or upon which the mind can rest with pleasure. Henry IV. (1056) was a distinguished victim of papal tyranny. The celebrated Hildebrand, known as Gregory VII., was in this age the means of raising the power of the church to a height which it had never reached before. During Henry's contest with this daring and ambitious pontiff, he made him twice his prisoner, and twice did the thunders of the Vatican excommunicate and depose him in consequence. As a specimen of the power and insolence of this pope, we may mention that Henry, dispirited by the effect which his excommunication had upon his friends and followers, having resolved to go to Rome and ask abolition from Gregory in person, did so; and presenting himself as a humble penitent at the palace of St Peter, was there stripped of his robes, and obliged to remain in that condition, in an outer court, in the month of January (1077), barefooted, among snow, and fasting, for three successive days,

## HISTORY OF THE MIDDLE AGES.

before he was allowed to implore forgiveness for his offences! On the fourth day he was permitted to kiss the toe of his holiness, and then received absolution! Henry died in 1106.

### ITALY FROM THE NINTH TO THE ELEVENTH CENTURY.

The state of Italy during this period has been already partially noticed in the preceding section. From the time of Lothaire, to whom it was nominally assigned as a separate kingdom (843), to that of Otho the Great (964), the country was ravaged by contending tyrants. Between the invasions of the Normans on the one hand, and the claims of the German emperors on the other, it became much distracted, and was ultimately split up into several independent states. Some of these, particularly Venice, Genoa, Pisa, and Florence, became afterwards independent and powerful republics. It was during this period that the foundation of the temporal power of the popes was laid.

### SPAIN FROM THE TIME OF ABDALRAHMAN TILL THE ELEVENTH CENTURY.

During the period of which we have been treating, Spain seemed less a part of Europe than any other country in it. The greater part of it still continued under the dominion of the Moors, and apparently with advantage. 'This period,' says Mr Tytler, 'from the middle of the eighth to the middle of the tenth century, is a most brilliant era of Arabian magnificence. Whilst Haroun al Raschid made Bagdat illustrious by the splendour of the arts and sciences, the Moors of Cordova vied with their brethren of Asia in the same honourable pursuits, and were undoubtedly at this period the most enlightened of the states in Europe. Under a series of able princes, they gained the highest reputation, both in arts and arms, of all the nations of the West.' And yet these Eastern conquerors seem to have had their troubles as well as others. A race of powerful nobles among them, as in the other countries of Europe, distracted the country, and made effective government impossible. The Christian part of the population, still possessed of several provinces in the north, might have taken advantage of such a state of things for repossessing themselves of their lost country; but civil dissension was still greater among themselves; and Christian princes readily formed alliances with the Moors, if they saw a prospect of weakening an immediate enemy by that means, forgetting that the common foe still remained to harass them. But the detail of these numerous and petty contentions need not detain us longer; nor does the history of Spain assume any importance till towards the conclusion of the fifteenth century, when the united arms of Ferdinand and Isabella expelled the Moors for ever from the country.

### GENERAL STATE OF EUROPE IN THE ELEVENTH CENTURY.

Before the end of the tenth century, Europe had reached a point of darkness and degradation beyond which it seemed impossible to go. Though long nominally converted to the Christian religion, the nations of Europe may be said to have scarcely exhibited, up to this period, a single distinctive mark of what men understand by Christian civilisation. 'The barbarous nations,' says Dr Robertson, 'when converted to Christianity, changed the object, not the spirit of their religious worship. They endeavoured to conciliate the favour of the true God by means not unlike to those which they had employed in order to appease their false deities. Instead of aspiring to sanctity and virtue, which alone can render men acceptable to the great Author of order and of excellence, they imagined that they satisfied every obligation of duty by a scrupulous observance of external ceremonies. Religion, according to their conception of it, comprehended nothing else; and the rites by which they persuaded themselves that they should gain the favour of Heaven, were of such a nature as might have been expected from the rude ideas of the ages which devised and introduced them. They were either so unmeaning as to

be altogether unworthy of the Being to whose honour they were consecrated, or so absurd as to be a disgrace to reason and humanity. Charlemagne in France, and Alfred the Great in England, endeavoured to dispel this darkness, and gave their subjects a short glimpse of light and knowledge. But the ignorance of the age was too powerful for their efforts and institutions. The darkness returned, and settled over Europe more thick and heavy than before.' The clergy were the only body of men among whom any knowledge or learning now remained; and this superiority they employed to continue, if not to deepen, the degradation into which society had fallen. The superstitious belief that moral crimes could be expiated by presents to the Deity, if not originated by them, at least found them its strenuous defenders, for the reason that a gift to God meant, in plainer language, a *solatium* to the church. The priests would have made men believe that avarice was the first attribute of the Deity, and that the saints made a traffic of their influence with Heaven. Hence Clovis is said to have jocularly remarked, that 'though St Martin served his friends very well, he also made them pay well for his trouble.'

Persons in the highest ranks and most exalted stations could neither read nor write. Of the clergy themselves, many of them did not understand the Breviary which it was their duty to recite; and some of them, it is asserted, could scarcely read it. Those among the laity who had to express their assent in writing, did so by a sign of the cross attached to the document (sometimes also by a seal); and to this day, in consequence, we speak of *signing* a document when we subscribe our names.

The evils of the feudal system, too, had by this time become excessive and insupportable. Every petty chief was a king in his own dominions, and his vassals were his subjects, if indeed they should not be called slaves. These barons made laws of their own, held courts of their own, coined money in their own names, and levied war at their own pleasure against their enemies; and these enemies were not unfrequently their kings. Indeed the kings of these times can be looked upon in no other light than as superior lords, receiving a nominal and empty homage for lands which, in the fictitious language of feudal law, were said to be held of the crown. In these circumstances, what might we expect to be the condition of the great body of the people! They were either actual slaves, or exposed to so many miseries, arising from pillage and oppression, that many of them made a voluntary surrender of their liberty in exchange for bread and protection from the feudal lords. There was no people, as that term is now understood. 'There was nothing morally in common,' says Guizot, 'between the lord and the serfs; they formed part of his domains, and were his property; under which designation were comprised all the rights that we at present call rights of public sovereignty, as well as the privileges of private property; he having the right of giving laws, of imposing taxes, and of inflicting punishment, as well as that of disposing and selling. In fact, as between the lord and the labourers on his domain, there were no recognised laws, no guarantees, no society, at least so far as may be predicated of any state in which men are brought into contact.' In what way society rose above so many accumulated evils, and light sprang from so much darkness, we shall now endeavour to show. The most remarkable and the most lasting influence, beyond all question, was that exerted by

### THE CRUSADES.

'It is natural to the human mind,' says Dr Robertson, 'to view those places which have been distinguished by being the residence of any celebrated personage, or the scene of any great transaction, with some degree of delight and veneration. To this principle must be ascribed the superstitious devotion with which Christians, from the earliest ages of the church, were accustomed to visit that country which the Almighty had

selected as the inheritance of his favourite people, and in which the Son of God had accomplished the redemption of mankind. As this distant pilgrimage could not be performed without considerable expense, fatigue, and danger, it appeared the more meritorious, and came to be considered as an expiation for almost every crime. An opinion which spread with rapidity over Europe about the close of the tenth and beginning of the eleventh century, and which gained universal credit, wonderfully augmented the number of credulous pilgrims, and increased the ardour with which they undertook this useless voyage. The thousand years mentioned by St John [Rev. xx. 2, 3, 4] were supposed to be accomplished, and the end of the world to be at hand. A general consternation seized mankind; many relinquished their possessions, and abandoning their friends and families, hurried with precipitation to the Holy Land, where they imagined that Christ would quickly appear to judge the world.\*

While Palestine continued subject to the caliphs, they had encouraged the resort of pilgrims to Jerusalem, and considered this as a beneficial species of commerce, which brought into their dominions gold and silver, and carried nothing out of them but relics and consecrated trinkets. But the Turks having conquered Syria about the middle of the eleventh century, pilgrims were exposed to outrages of every kind from these fierce barbarians. This change happening precisely at the juncture when the panic terror which I have mentioned rendered pilgrimages most frequent, filled Europe with alarm and indignation. Every person who returned from Palestine related the dangers which he had encountered in visiting the holy city, and described with exaggeration the cruelty and vexations of the infidel Turks.

Among the most notorious of those who had returned with these accounts, was a monk known by the name of Peter the Hermit. By all accounts this individual seems to have been a weak-minded and contemptible being. He is represented as running from city to city, and from kingdom to kingdom, bareheaded, with naked arms and legs, and bearing aloft a ponderous crucifix in his hand, imploring and preaching with an enthusiastic madness on the necessity of wresting the Holy Land from the hands of the infidels. In a more enlightened age, Peter the Hermit would probably have been confined as a troublesome lunatic; in this, however, he was not only allowed to go on, but encouraged and abetted in his career. The ambitious Hildebrande had expressed a strong desire to send armed forces from Europe to exterminate the Mohammedans from Palestine, in order that another country might be brought under his spiritual subjection; and Urban II., who at this time occupied the chair of St Peter, warmly seconded the efforts of the enthusiastic monk. Nor was Peter's success small. Vast multitudes proclaimed themselves ready to engage in the undertaking. Two great councils of the church, one of them held at Placentia, and the other at Clermont, in Auvergne, attended by prelates, princes, and immense multitudes of the common people, declared enthusiastically for the war (1095). The pope himself attended at the last, and Peter and he having both addressed the multitude, they all exclaimed, as if impelled by an immediate inspiration, 'It is the will of God! it is the will of God!' These words were thought so remarkable, that they were afterwards employed as the motto on the sacred standard, and came to be looked upon as the signal of battle and of rendezvous in all the future exploits of the champions of the cross. Persons of all ranks now flew to arms with the utmost ardour. The remission of penance, the dispensation from those practices which superstition imposed or suspended at pleasure, the absolution of all sins, and the assurance of

\* Mr Hallam mentions, as corroborative of this general belief, that charters at this period usually commenced with these words: 'As the world is now drawing to its close; and that an army, marching under the Emperor Otho I., was so terrified by an eclipse of the sun, which it conceived to announce this consummation, as to disperse hastily on all sides.

eternal felicity, were the rewards held out by the church to all who joined the enterprise; and 'to the more vulgar class,' says Mr Hallam, 'were held out inducements which, though absorbed in the overruling fanaticism of the first Crusade, might be exceedingly efficacious when it began to flag. During the time that a Crusader bore the cross, he was free from suits for his debts, and the interest of them was entirely abolished; he was exempted, in some instances at least, from taxes, and placed under the protection of the church, so that he could not be implicated in any civil court, except in criminal charges or questions relating to land.'

It was in the spring of the year 1096 that Peter set out for Judea, at the head of a promiscuous assemblage of 80,000 men, with sandals on his feet, a rope about his waist, and every other mark of monkish austerity. Soon after, a more numerous and better disciplined force of 200,000 followed, including some able and experienced leaders. Godfrey of Bouillon, Robert, Duke of Normandy (son of William the Conqueror of England), the Counts of Vermandois, Toulouse, and Blois, are a few of the more illustrious. The progress of this immense mass of human beings on their journey was marked by misery and famine. They had vainly trusted to Heaven for a supernatural supply of their wants, and in their disappointment they plundered all that came in their way. 'So many crimes and so much misery,' says Mr Hallam, 'have seldom been accumulated in so short a space, as in the three years of the first expedition;' and another historian says, that a 'fresh supply of German and Italian vagabonds,' received on the way, were even guilty of pillaging the churches. It is certain that before the hermit reached Constantinople, the number of his forces had dwindled down to 20,000. Alexis Comnenus, then emperor of Constantinople, who had applied to the states of Europe for assistance, without much hope of obtaining it, in order that he might be enabled to resist a threatened attack by the Turks upon himself, was surprised and terrified at the motley group of adventurers who had now reached the shore of his dominions. He readily afforded them the means of transporting themselves across the Bosphorus, and performed the same friendly office to the larger force which followed under Godfrey and others; glad, apparently, to have the barbarians of the north, as his subjects called them, out of his dominions. The Sultan Solyman met the army of the hermit, if army it could be called, and cut the greater part of it to pieces on the plains of Nicea. The second host proved more successful. In spite of their want of discipline, their ignorance of the country, the scarcity of provisions, and the excess of fatigue, their zeal, their bravery, and their irresistible force, enabled them twice to overthrow old Solyman, to take his capital Nice, and after an obstinate resistance, the city of Antioch also (1098). At length (1099) they reached Jerusalem, much diminished in numbers, and broken in spirit; but with persevering assiduity they proceeded to lay siege to the city, and in six weeks they became its masters. Their cruel conduct to the inhabitants attests the barbarous feelings of their hearts. 'Neither arms defended the valiant, nor submission the timorous; no age nor sex was spared; infants on the breast were pierced by the same blow with their mothers, who implored for mercy; even a multitude of ten thousand persons, who had surrendered themselves prisoners and were promised quarter, were butchered in cold blood by these ferocious conquerors. The streets of Jerusalem were covered with dead bodies. The triumphant warriors, after every enemy was subdued and slaughtered, turned themselves, with the sentiments of humiliation and contrition, towards the holy sepulchre. They threw aside their arms, still streaming with blood; they advanced with reclined bodies and naked feet and heads to that sacred monument; they sung anthems to Him who had purchased their salvation by His death and agony; and their devotion, enlivened by the presence of the place where He had suffered, so overcame their fury, that they dissolved in tears, and bore the appear-

## HISTORY OF THE MIDDLE AGES.

ance of every soft and tender sentiment. So inconsistent is human nature with itself, and so easily does the most effeminate superstition ally both with the most heroic courage and with the fiercest barbarity!

With a becoming foresight, the Crusaders established a Christian kingdom in the heart of Palestine; and at the head of it, by universal consent, was placed Godfrey, whose goodness and justice had signalised him, and gained him respect in the midst of the general wickedness. The pope, however, was too eager to enjoy the triumph to which he had looked forward, and sending an ignorant and obtruding ecclesiastic to assume this command, Godfrey retired; and thus was lost undoubtedly the best chance that Europeans ever had of really possessing the Holy Land. The Turks had now time to recover their strength and renew their attacks: they did so: many of the Crusaders had in the meantime returned home, and those of them who remained, surrounded and menaced by such foes, at last implored aid from Christendom. There the spirit which had been raised by Peter the Hermit was far from being extinguished; and another, more eloquent and more learned than Peter—namely, St Bernard—had arisen to keep alive the flame of devotion. Roused by his preachings, Europe sent forth a second Crusade (1147). It consisted of 200,000 French, Germans, and English, in two divisions, the first led on by Conrad III. of Germany, and the second by Louis VII. of France. Strangely enough, both these leaders permitted themselves to be drawn into a snare by false guides, furnished by the Greek emperor; and both armies, one after another, were withdrawn amidst the rocks of Lædices, and after being nearly starved by famine, they were cut to pieces by the Sultan of Iconium. This Crusade proved the most disastrous of them all. 'Thousands of ruined families,' says Russell, 'exclaimed against St Bernard for his deluding prophecies: he excused himself by the example of Moses, who, like him, he said, had promised to conduct the Israelites into a happy country, and yet saw the first generation perish in the desert.'

It was shortly after this period that the illustrious Saladin appeared (1180). Born among an obscure Turkish tribe, this individual fixed himself by his bravery and conduct on the throne of Egypt, and began to extend his conquests in the East. The still existing, though wretchedly-supported kingdom of the Christians in Palestine, proving an obstacle to the progress of his arms, Saladin directed his power against it, and assisted by the treachery of the Count of Tripoli, he completely overcame the Christians in battle (1187). The holy city itself fell into his hands after a feeble resistance; and except some cities on the coast, nothing remained to the Christians of all that, a century before, it had cost Europe so much to acquire. The followers of the cross, however, were not yet wholly disheartened; and a third great Crusade was entered into before the end of the twelfth century.

The three greatest sovereigns of Europe—Frederick Barbarossa of Germany, Philip Augustus of France, and Richard Cœur de Lion of England—all took part in the scheme. The forces of Frederick were earliest in the field. He had passed through the unfriendly territories of the Greek empire, crossed the Hellespont, and defeated the infidels in several battles, before Richard or Philip had stirred from home. The Christians of the East were beginning to look with hope and pride on so great assistance; but they seemed fated to be unfortunate. Frederick died (1190) from having thrown his body, heated by exertion, into the cold river of Cydnus; and his army, like the others that had gone before it, dwindled into nothing. The united armies of Richard and Philip followed. In their progress, the feelings of envy and national hatred rose above the object which had brought them together. Philip returned, disgusted or dismayed, shortly after they reached their destination; and Richard was thus left alone to uphold the glory of European arms. He did it nobly. With a mixed army of French, German,

and English soldiers, amounting in all to 30,000, Richard performed feats of valour which have not been surpassed in the history of any time or nation. On the plains of Ascalon, a tremendous battle was fought with Saladin, and that brave and great man was defeated, and 40,000 of his soldiers are said to have been left dead upon the field of battle. But this conquest was unavailing, and the followers of Richard began to fear that there would be no end to their struggles. The zeal which had brought so many of them from their homes, and sustained them so long in absence, at last abated. Saladin readily concluded a treaty by which Christians might still be permitted to visit the tomb of Christ unmolested, and Richard left the Holy Land for ever. It is due to the memory of Saladin (who did not long survive this period) to state that, after he made himself master of Jerusalem, he never molested the Christians in their devotions—a circumstance which, by contrast, reflects infinite disgrace on the cruel barbarities of the first Crusaders. In his last will he ordered alms to be distributed among the poor, without distinction of Jew, Christian, or Mohammedan; intending by this bequest to intimate that all men are brethren, and that when we would assist them, we ought not to inquire what they believe, but what they feel—an admirable lesson to Christians, though from a Mohammedan. But the advantages in science, in moderation, and in humanity, seem at this period to have been all on the side of the Saracens.

There were no more great Crusades. Considerable bands of private adventurers still continued to move eastward; but disaster and disgrace attended every effort, and Europe at last became disheartened when the bones of two millions of her sons lay whiteened on the plains of Asia, and so little had been accomplished. Nevertheless, in the year 1202, Baldwin, Count of Flanders, was able to raise another considerable army for the rescue of the Holy Sepulchre; but having reached Constantinople at a time when there was a dispute in the succession to the throne, he readily laid aside the project of the Crusade, took part in the quarrel, and in the course of five months he was himself the emperor. The citizens of Venice in Italy, who had lent their vessels for this enterprise, shared in the triumphs of the piratical Crusaders: they obtained the Isle of Candia, or Crete. Baldwin, however, was soon driven from the throne, and murdered; though the Latins, as his successors from the West were called, kept possession of Constantinople for fifty-seven years.

At this period (1227) a great revolution took place in Asia. Ghenghis Khan, at the head of a body of Tartars, broke down from the north upon Persia and Syria, and massacred indiscriminately Turks, Jews, and Christians, who opposed them. The European settlements in Palestine must soon have yielded to these invaders, had not their fate been for a while retarded by the last attempt at a Crusade under Louis IX. of France. This prince, summoned, as he believed, by Heaven, after four years' preparation set out for the Holy Land with his queen, his three brothers, and all the knights of France (1248). His army began their enterprise, and we may say ended it also, by an unsuccessful attack on Egypt. The king went home, and reigned prosperously and wisely for thirteen years; but the same frenzy again taking possession of him, he embarked on a Crusade against the Moors in Africa, where his army was destroyed by a pestilence, and he himself became its victim (1270).

Before the end of the thirteenth century (1291) the Christians were driven out of all their Asiatic possessions. 'The only common enterprise,' says Robertson, 'in which the European nations were engaged, and which they all undertook with equal ardour, remains a singular monument of human folly.'

### INSTITUTION OF CHIVALRY—STATE OF EUROPE DURING AND AFTER THE CRUSADES.

Among the most remarkable institutions of the middle ages was that of Chivalry. The institution was certainly not the result of caprice, nor a source of

unmixed extravagance, as it has been represented, but an effort of human nature to express its feelings of love, honour, and benevolence, at a time when the spirit of liberty was extinguished, and religion had become debased. The feudal state was a state of perpetual war, rapine, and anarchy, during which the weak and unarmed were often exposed to injuries. Public protective law scarcely had an existence; and in these circumstances assistance came oftenest and most effectually from the arms of private friends. It was the same feeling of courage, united to a strong sense of duty, which both gave rise to chivalry, and led such multitudes to join the Crusades. Chivalry existed before them, and it survived them. Those who devoted themselves to a life of chivalry were called knights, and sometimes knight-errants, in allusion to their habits of wandering from one country to another in search of helpless objects, which their generosity might find a pleasure in relieving and defending. Admission to the order of knighthood was long reckoned an honour of the highest sort; and to fulfil the vows which entrants took upon them might well be considered so. They were bound, 'by God, by St Michael, and St George,' to be loyal, brave, and hardy; to protect the innocent, to redress the injuries of the wronged; and, above all, to uphold and defend the characters of women. The institution of chivalry is sometimes thought to have thrown an air of ridiculousness upon everything connected with the softer sex, and some of the vagaries of knight-errantry gave sufficient countenance to such a supposition; but on the whole we are bound to rate its beneficial influences in elevating the female character high indeed, when we contrast the gross and grovelling situation held by the sex in former times with the high and virtuous emotions that we have learned to associate in modern times with the name of woman. If the whole of this effect is not to be ascribed to chivalry, not a little of it must certainly be so; nor do its beneficial effects end here. The feelings of honour, courtesy, and humanity, which distinguished it, spread themselves into other parts of conduct. War, in particular, was conducted with less ferocity, and humanity came to be deemed as necessary to an accomplished soldier as courage. The idea of a *gentleman* is wholly the production of chivalry; and during the twelfth, thirteenth, fourteenth, and fifteenth centuries, a sense of honour and a refinement of manners towards enemies sprung up, which have extended to modern times, and form a distinguishing feature of them.

The history of the Crusades has carried us over nearly two centuries of the history of Europe. But Europe might be said, almost without exaggeration, to have been then in Asia. It was certainly not the scene of any transaction of importance during all that period. The numerous quarrels, both public and private, which had before agitated the several countries, and had constituted all their history, gave way, by mutual consent, as well as by the orders of the church, to the one idea which then reigned supreme among them. Society was thus unconsciously the means of permitting some of those powerful and pacific principles to come into play, which were soon to give it a new destiny. The absence of so many great barons during the time of the Crusades, was a means of enabling the common people, who had hitherto lived as their slaves, to raise themselves in public standing and estimation; while the possessions of many of these barons, by sale or the death of their owners without heirs, reverted to the sovereigns. In this way the power of the people and of royalty advanced together, and both at the expense of the class of nobility. The people were not unwilling to exchange the mastery of inferiors for that of a superior; and the kings, on their part, looked on this rising power of the people with pleasure, as it offered a shield to protect them from the insolence of the nobles. In these circumstances boroughs began to flourish. This was a new element in the progress of civilisation. Men who had hitherto skulked in castles, and had sacrificed their liberties and their lives for bread and protection from isolated chiefs,

now found that, by a union among themselves, they might secure bread by industry, and protection and liberty by mutual aid. Multitudes, therefore, forsook their feudal subservience to enjoy independent citizenship. Villeins, or labourers, joyfully escaped, to take their place on a footing of equality with freemen; and sovereigns found means to pass a law that, if a slave should take refuge in any of the new cities, and be allowed to remain there unclaimed for a twelvemonth, he had thereby become free, and was henceforth a member of the community. Another improvement which kings were able to introduce about this time was the gradual abolition of minor courts of justice, which barons had previously held in their several domains, and their getting public and universal law administered by judges of their own appointment. Even single combat, the practice most inveterately adhered to of any among the ancient nobles, became less frequent and less honourable. The more revolting and absurd features of it were wholly abolished, though the great absurdity, and indeed the great crime itself, cannot be said to have become totally extinct, even up to our own day, when we recollect that the barbarous practice of duelling is still permitted to exist.

The effect, however, produced by the Crusades, which proved greatest in its consequences, though perhaps it was the most unlooked for at the time, was the rise of commerce. The first of these expeditions had journeyed to Constantinople by land; but the sufferings were so great, that all the rest were induced to go by sea. The Italian cities of Venice, Genoa, and Pisa, furnished the vessels which conveyed them; and the sums of money obtained for the freight of so many and so great armies were immense. This, however, was but a small part of what the Italian citizens gained by the expeditions to the Holy Land. The Crusaders contracted with them for military stores and provisions; and any of the Asiatic possessions of value, which came temporarily into the hands of the Christians, became emporiums of commerce for them. The sweet reward of labour was thus first felt for ages in Europe. New arts were brought from the East, and many of those natural productions of the warmer climates were first introduced into the West, which have since afforded the materials of a lucrative and extended commerce. We will allude in a separate section to the brilliant career of several of the Italian Republics—(see p. 124).

In these views we represent the fairest side of the picture. There were yet many obstacles in the way of a complete and harmonious evolution of the principles of civilisation. But the elements all seemed now to have acquired existence, and time only was required to consolidate and strengthen them.

#### FROM THE CRUSADES TO THE MIDDLE OF THE FIFTEENTH CENTURY—RISE OF SOME NEW POWERS.

The most remarkable general feature of European society about the time of the Crusades was the papal influence. Between the pontiffs and the German emperors there was kept up a perpetual struggle for power; but for a long time the advantage was almost always with the popes. The treatment which some of the emperors received from them was extremely humiliating. Frederick Barbarossa was compelled to kiss the feet of his holiness, Alexander III., and to appease him by a large cession of territory, after having indignantly denied his supremacy, and refused the customary homage. Henry VI., while doing homage on his knees, had his imperial crown kicked off by Pope Celestine, who, however, made some amends for this indignity by the gift of Naples and Sicily. Henry had expelled the Normans from these territories, which now became appendages of the German empire (1194). In the beginning of the thirteenth century, Pope Innocent III. was imagined to have permanently established the powers of the Holy See, and its right to confer the imperial crown; but this proved far from being the case. In the time of Frederick II., who succeeded Otho IV. (1212), the old contentions rose to more than the usual

## HISTORY OF THE MIDDLE AGES.

height, and two factions sprung up in Italy, known by the names of Guelphs and Ghibellines, the former maintaining the supremacy of the popes, and the latter that of the emperors. Frederick maintained the contest which now arose between himself and the popes with much spirit; but on his death (1250) the splendour of the empire was for a considerable time obscured. At length Rodolph of Hapsbourg, a Swiss baron, was elected emperor (1274). Rodolph became the founder of the House of Austria, and ruled with both vigour and moderation. His son Albert I. was the means of causing the inhabitants of Switzerland to assert and obtain their liberty, by his attempting to bind them in subjection to one of his children, and then using force to compel them. In the pass of Morgarten, a small army of four or five hundred of these brave mountaineers defeated an immense host of Austrians (1315). Sixty pitched battles, it is said, were fought between the contending parties; but the spirit of William Tell, who appeared at this time, and of his patriot countrymen, rose above all attempts to enslave them; and the Swiss cantons secured a freedom which their descendants enjoy to this day. The further history of Germany, for nearly a century, is not politically important. Disputes between the emperors and the papacy still continued, though the balance of advantage was now oftener against the church.

About the beginning of the fifteenth century, the great papal schism, as it has been called, took place. It arose from there being no fewer than three different claimants for the chair of St Peter—Gregory XII., who was owned pope by the Italian states; Benedict XIII., by France; and Alexander V., a native of Candia, by a number of the cardinals. This schism proved very hurtful to the authority of the church, though in that respect it benefited the interests of society, and contributed to open men's eyes. The appearance of John Huss at this time aided in producing that effect. Huss proclaimed the same opinions as the great English reformer Wickliffe. He was branded of course by the clergy as a heretic and propagator of sedition. The general council of the church, held at Constance (1414), concocted no fewer than thirty-nine articles in which Huss is said to have erred. Some of the points he denied having professed, and others he offered to support by argument; but his voice was drowned by the clamours of bigotry. His hair was cut in the form of a cross; upon his head was put a paper mitre, painted with the representation of three devils; and he was delivered over to the secular judge, who condemned both him and his writings to the flames. A similar fate shortly after befell his disciple, Jerome of Prague, who is said to have exhibited the eloquence of an apostle and the constancy of a martyr at the stake (1416). In revenge for these cruelties, the Hussites of Bohemia kept up a war with the empire for twenty years; and it was only after having their right to express their opinions acknowledged that they desisted. The great schism lasted for many years. A Neapolitan archbishop, named Bari, was elected and deposed by the resident cardinals at Rome within a few months. Boniface IX. and Innocent VI. were each temporarily his successors. The result of the lengthened dispute may be stated to be, that papal authority was greatly weakened; the government of the church was brought down among a class of ecclesiastics that had never before tasted the sweets of power; and future popes were obliged to resort to such questionable practices for the maintenance of their dignity, that men in general began to lose respect for their sanctity, and a foundation was laid for changes which it fell to the lot of Luther and others to effect.

The period which witnessed these transactions was remarkable for the continued wars between France and England. In the beginning of the twelfth century, the famous dispute for supremacy arose between Thomas à Becket, archbishop of Canterbury, and Henry II., which ended in the death of the prelate (1171), but in the triumph of his principles. The beginning of the

thirteenth century is memorable in English history, as having witnessed the granting of the Magna Charta by King John; and towards the conclusion of it appeared Edward I., whose name is associated with the first great attempts to subdue the Scots on the part of England. The bravery of Wallace and of others averted that calamity for ever. Wales was not so fortunate; and Ireland had already become a conquered province. The grandson of Edward I., named Edward III., proved himself as ambitious and as sagacious as his predecessor. His attention, however, was greatly diverted from the kingdom of Scotland to that of France, with which country he commenced a war, that proved greater in duration and extent than any that had occurred in Europe since the fall of the Roman Empire. The proposal of subduing so great a country as France, and seating himself upon the throne of it, seemed at first to be the proposal of a madman; but in less than twenty years, Edward had so effectually dismembered the different provinces, alienating some of the nobility and overawing others, that his attaining the object of his desires seemed by that time no improbable nor distant reality. His son, known in history as Edward the Black Prince, named so from the colour of his armour, contributed much by his presence and his valour to the success of the English arms. In the battle of Cressy, fought in 1346, with numbers greatly on the side of France, and in that of Poitiers, fought ten years later, under similar circumstances, the English were completely victorious. John, king of France, was taken prisoner, and the conduct of young Edward to his fallen enemy was generous and delicate in the highest degree; so that the French prisoners are said to have been overcome by the display of such an elevation of mind on the part of their conqueror, and to have burst into tears. This refinement was the result of chivalry, which both the Edwards attached themselves to, and rendered respectable by their virtues.

France was at this time in a deplorable state. A foreign enemy in the heart of the kingdom, the king a prisoner, the capital in sedition, and civil war raging over and above all—these were some of her accumulated misfortunes; and as if nature meant to conspire with man for her destruction, a plague broke out at this time among the people, and consummated the work of famine and the sword. This plague, however, was not confined to France, though, from the dilapidated state of that country, it proved perhaps in it most disastrous. It invaded every kingdom of Europe, and the English historian, Hume, computes that it swept away about one-third of the inhabitants of every country that it attacked. The origin of the disease is not well known; but there can be no doubt that it could only have made the ravages which it did among nations uncivilised and ignorant, heedless of all the cleanliness and comforts which we know in modern times to be necessary to the preservation of health. According to the ordinary account, this pestilence took its rise in the Levant about the year 1346, from whence Italian traders brought it to Sicily, Pisa, and Genoa. In 1348 it passed the Alps, and spread over France and Spain. In the next year it reached Britain, where, in London alone, 50,000 persons are said to have become its victims; and in 1350, it laid waste Germany and other northern states, lasting generally in each country about five months. At Florence, more than three out of every five of the inhabitants were swept away. It is well known to those acquainted with Italian literature, that the time of Boccaccio's Decameron is laid during this pestilence.

While the plague lasted, a temporary truce had been agreed upon between the French and English. At that time the balance of advantage was greatly in favour of the English. Not to mention less important gains, all Guienne, Gascony, Poitou, Saintonge, the Limousin, and the Angoumois, as well as Calais, and the county of Ponthieu, were ceded in full sovereignty to Edward, and the empty title of King of France was all that he became bound to give up (1360). But it was found

impossible to retain possessions in the heart of a foreign country, though won by consummate bravery and ruled with no imprudence. In less than ten years (1368), the war was recommenced, and the English began to lose many of the provinces which they had previously acquired. Charles V., who had acted as regent in France during the captivity of his father John, and was now his successor on the throne, contributed greatly by his wisdom to this result; and his general, Du Guesclin, contributed not less to it by his valour. England had lost both its Edwards, and Richard II. proved destitute of abilities for leading on the enthusiasm of his countrymen to anything great. Charles died prematurely, however, a circumstance which proved unfortunate for France, as his son, the sixth of the same name, was a very unworthy successor. For forty years Charles VI. may be said to have borne the name of king, rather than to have reigned in France. The wealth accumulated by Charles the Wise was, in the first place, stolen by the Duke of Anjou; and afterwards, by reason of want of funds, and misapplication of what they had, Charles VI. and his ministers were fully more engaged in quarrels with the citizens of Paris and other subjects, than in any becoming efforts to expel the English. History records, however, that the king became totally imbecile in mind (1393), so that he was, by universal consent, excluded from all share in the government, and the Houses of Burgundy and Orleans long struggled for the regency. At this period Henry V. of England put in a claim for the government of the kingdom, on the strength of a distant relationship to the reigning family; and after having gained the memorable battle of Agincourt (1415), he was actually promised the throne on the death of Charles, though his own death prevented this from ever taking place. It may be worth remarking, that *cards* were invented in this age. The desire to amuse the silly king of France was the cause. In the year 1422, Charles VII., surnamed the Victorious, was crowned king of France at Poitiers, while the crown was claimed on the part of Henry VI. of England, yet an infant. The war continued, and the English were like to have proved victorious, when a simple maiden, named Joan of Arc, made her appearance at the head of the armies of France, and turned the tide of fortune in favour of her country. Apparently mistaking the impulses of superstition for Divine inspiration, she gave out that she had been commissioned by Heaven to save her country; and having succeeded in inspiring the French soldiery with that belief, she led them on to battle, and they proved victorious. It must be recorded, to the disgrace of our countrymen, that Joan, being shortly after taken prisoner, was condemned to be burnt as a sorceress. The French, however, were but the more exasperated at this; and their victory of Formigny, and the death of Talbot, perhaps the greatest English warrior of the age, now left them in possession of all their country, with the exception of Calais and Greignes (1450).

Of all that was done by England to obtain a footing in France, a barren title to our sovereigns alone is all that was preserved till a recent period. The power and spirit of the French nation rose above all calamities, and in less than half a century, having freed herself of every enemy at home, her arms were in a condition to be directed externally with effect. The invasion of Naples by Charles VIII. was the event that first engaged the principal states of Europe in relations of alliance or hostility, which may be deduced to the present day, and is the point which most appropriately terminates the history of the middle ages.

During this period, several of those countries in the north of Europe, which have made a considerable figure in modern history, for the first time attracted attention. The greatest of these was Russia. In the middle of the thirteenth century, the tribes of Tartary made a complete conquest of this country, and for about a hundred years they maintained their supremacy. At length Ivan ascended the throne of Moscow (1462), and overcoming the Tartars, established a kingdom of

his own, and was able to form an alliance with the Emperor Maximilian of Germany, who did not hesitate to style him brother. This was the first entrance of Russia into European politics.

Before the end of the fourteenth century, the Christian religion had penetrated into Denmark, Sweden, Prussia, and Poland; but it failed in producing any immediate beneficial effect. The political events which took place in these countries, however, were very various at this period, but proved too unimportant in their results to admit of being even outlined here.

#### THE ITALIAN REPUBLICS—COMMERCE IN GENERAL.

Among the Italian cities, Venice, at the extremity of the Adriatic, Ravenna, at the south of the mouth of the Po, Genoa, at the foot of the Ligurian mountains, Pisa, towards the mouths of the Arno, Rome, Gaëta, Naples, Amalphi, and Bari, were either never conquered by the Lombards, or were in subjection too short a time to have lost many of their ancient habits and customs. In this way these cities naturally became the refuge of Roman civilisation, at a time when other parts of Europe were wading through barbarian darkness. The feudal system never prevailed among them with any force; and several of these and other cities had important privileges conferred upon them by the German emperors at a very early period. Sismondi, the historian of Italy, asserts that Otho I. (936) erected some of them into municipal communities, and permitted them the election of their own magistrates. It is certain that, in 991, the citizens of Milan rose in tumult, expelled an archbishop from their city, and were able to establish a qualified right to interfere in future elections. The after-history of Milan is eventful and tragical; but we can only give a short account of it here. In the middle of the twelfth century, Frederick Barbarossa became engaged with the cities of Lombardy, and particularly with it, in extensive and destructive wars. In the year 1162 Milan was finally overcome; the walls and houses were razed from their foundation, and the suffering inhabitants dispersed over other cities, obtaining sympathy in their distress, and communicating their enthusiastic love of freedom in return. The republican form of government was adopted in every considerable town; and before the end of the thirteenth century, there was a knowledge, a power, and an enterprise, among these apparently insignificant republics which all Europe could not match.

The beneficial though unlooked-for effect of the Crusades upon commerce has already been mentioned. During the twelfth and thirteenth centuries the commerce of Europe was almost entirely in the hands of the Italians, more commonly known in those ages by the name of Lombards. The republic of Pisa was one of the first to make known to the world the riches and power which a small state might acquire by the aid of commerce and liberty. Pisa had astonished the shores of the Mediterranean by the number of vessels and galleys that sailed under her flag, by the succour she had given the Crusaders, by the fear she had inspired at Constantinople, and by the conquest of Sardinia and the Balearic Isles. Immediately preceding this period, those great structures which still delight the eye of the traveller—the Dome, the Baptistry, the Leaning Tower, and the Campo Santo of Pisa had all been raised; and the great architects that spread over Europe in the thirteenth century had mostly their education here. But unfortunately, the ruin of this glorious little republic was soon to be accomplished. A growing envy had subsisted between it and Genoa during the last two centuries, and a new war broke out in 1282. It is difficult to comprehend how two simple cities could put to sea such prodigious fleets as those of Pisa and Genoa. Fleets of thirty, sixty-four, twenty-four, and one hundred and three galleys, were successively put to sea by Pisa, under the most skilful commanders; but on every occasion the Genoese were able to oppose them with superior fleets. In August 1284, the Pisans were defeated in a naval engagement before the Isle of

Meloria; thirty-five of their vessels were lost, five thousand persons perished in battle, and eleven thousand became prisoners of the Genoese. After a few further ineffectual struggles, Pisa lost its standing.

The greatest commercial, and altogether the most remarkable city of the Italian republics, was Venice. Secluded from the world, on a cluster of islands in the Adriatic, the inhabitants of this city had taken up their abode in the course of the fifth century, and they boasted themselves to have been independent of all the revolutions which Europe had been undergoing since the fall of the Roman Empire. This might be true to a great extent, though for long it was certainly more the result of their obscurity than their power. By the tenth century, however, the descendants of those fishermen that had first taken refuge here, were able to send fleets abroad which could encounter and overawe both Saracens and Normans. The Venetians had all along kept up a correspondence with Constantinople during the darkest periods of the middle ages. This was greatly renewed and extended about the time of the Crusades. When Constantinople was taken by the Latins (1204), the Venetians, under their doge, or chief magistrate, Henry Dandolo, became possessed of three-eighths of that great city and of the provinces, and Dandolo assumed the singularly accurate title of Duke of Three-Eighths of the Roman Empire. The Venetians greatly increased their share of the spoil by making advantageous purchases from the more needy of the Crusaders. Among the most important of these was the Isle of Candia, which they retained till the middle of the seventeenth century. The idea of a bank took its rise in this city, and an establishment of that nature, simply for the receipt of deposits, is said to have existed in it so soon as the year 1157. But it was not till about a century later that banking, as the term is now understood, began at all to be practised. The merchants of Lombardy and of the south of France began at that time to remit money by bills of exchange, and to make profit upon loans. The Italian clergy who had benefices beyond the Alps, found the new method of transmitting money exceedingly convenient; and the system of exacting usury or interest, after experiencing every obstruction from ignorance and bigotry, became a legal part of commerce. In the thirteenth century the government of Venice was entirely republican; but continued wars with Genoa reduced both cities. These wars were all conducted on the sea, and the display of naval strength on both sides seems prodigious, when we reflect on the poor condition of Italy at the present day. Besides these wars for objects of ambition, there were continual jealousies which rose above enlightened views of self-interest, and led to the most disgraceful broils. At the middle of the fourteenth century a battle took place between the rival citizens, in which the Genoese were defeated. Their loss was immense, and in distress and in revenge they gave themselves up to John Visconti, Lord of Milan, then the richest and among the most ambitious of the petty tyrants of Italy, hoping that he would give them the means to re-establish their fleet and continue the war with the Venetians. He did so, and in another naval engagement, fought in 1354, in the Gulf of Sapienza, the Venetians were entirely defeated. But the Genoese had sacrificed their liberty in their thirst for revenge. Visconti became their master instead of friend. Venice was able to rise above its temporary discomfiture, and during the fifteenth century its fame and power became greater than they had ever been before. In the beginning of the fifteenth century the Venetians captured the town of Padua, and gradually lost their empire of the sea while they acquired possessions on the continent.

Among the most famous of the Italian states at this period was Florence; and its fame was founded, not on arms, but on literature. Like the other Italian cities, however, it owed its first elevation to the commercial industry of its inhabitants. There was a curious division of the Florentine citizens, subsisting about the beginning of the thirteenth century, into companies

or arts. These were at first twelve—seven called the greater arts, and five the lesser; but the latter were gradually increased to fourteen. The seven greater arts were those of lawyers and notaries, of dealers in foreign cloth (called sometimes *calimala*), of bankers or money-changers, of woollen-drappers, of physicians and druggists, of dealers in silk, and of furriers. The inferior arts were those of retailers of cloth, butchers, smiths, shoemakers, and builders. It was in the thirteenth century that Florence became a republic, and it maintained its independence for two hundred years. In the beginning of the fifteenth century it became peculiarly distinguished by the revival of Grecian literature and the cultivation of the fine arts. Cosmo de Medici, who lived a citizen of Florence at this time, and was known by the name of the Grand Duke of Tuscany—descended from a long line of ancestors, whose wealth had been honourably acquired in the prosecution of the *greater arts*—possessed more riches than any king in Europe, and laid out more money on works of learning, taste, and charity, than all the princes of his age. The same liberality and munificence distinguished his family for several generations.

The commercial success of the states of Italy induced the inhabitants of northern Europe to attempt similar enterprises. In the thirteenth century the seaports on the Baltic were trading with France and Britain, and with the Mediterranean. The commercial laws of Oleron and Wisby (on the Baltic) regulated for many ages the trade of Europe. To protect their trade from piracy, Lubec, Hamburg, and most of the northern seaports, joined in a confederacy, under certain general regulations, termed the *League of the Hansa Towns*; a union so beneficial in its nature, and so formidable in point of strength, as to have its alliance courted by the predominant powers of Europe. 'For the trade of the Hansa Towns with the southern kingdoms, Bruges on the coast of Flanders was found a convenient entrepôt, and thither the Mediterranean merchants brought the commodities of India and the Levant, to exchange for the produce and manufactures of the north. The Flemings now began to encourage trade and manufactures, which thence spread to the Brabanters; but their growth being checked by the impolitic sovereigns of those provinces, they found a more favourable field in England, which was destined thence to derive the great source of its national opulence.'

#### THE TURKS—FALL OF CONSTANTINOPLE.

We have already seen the weakness of the empire of Constantinople at the time of the Crusades; we have seen the city sacked and the government seized by the champions of the cross. The Greeks regained their empire in the year 1261, but in a mangled and impoverished condition. For nearly two centuries it continued in a similar state. Andronicus, son of Michael Paleologus, who had restored the Greek empire, allowed himself to be persuaded that, as God was his protector, all military force was unnecessary; and the superstitious Greeks, regardless of danger, employed themselves in disputing about the transfiguration of Jesus Christ, when their unfortunate situation made it necessary that they should have been studying the art of war, and training themselves to military discipline.

In the meantime, the Turks had become a powerful people. They had embraced the Mohammedan religion long before the time of the Crusades, and proved powerful obstacles to the success of those expeditions. About the beginning of the fourteenth century they established an empire of their own in Asia Minor, under Othman or Ottoman, and to this day the Ottoman Empire is a name given to the dominions of their descendants. By degrees they encroached on the borders of the empire of Constantinople, and they were only prevented from subverting it at a much earlier period than they did, by being called upon to defend themselves from the arms of an Eastern conqueror who arose at this time. Tamerlane, otherwise called Tamerbek, was a prince of the Usbek Tartars, and a descendant from Ghenghis Khan.

After having overrun Persia, and a great part of India and Syria, this great conqueror was invited by some of the minor princes of Asia, who were suffering under the Ottoman tyranny, to come and protect them. Tamerlane was flattered by the request, and having brought a great army into Phrygia, he was there met by Bajazet, the Ottoman emperor, who readily gave battle, but was defeated and made prisoner (1402). Tamerlane made Samarcand the capital of his empire, and there received the homage of all the princes of the East. Illiterate himself, he was solicitous for the cultivation of literature and science in his dominions; and Samarcand became for a while the seat of learning, politeness, and the arts, but was destined to relapse after a short period into its ancient barbarism. The Turks, after the death of Tamerlane, resumed their purpose of destroying the empire of the East. The honour, or disgrace, as it may be thought, of effecting this, fell to the lot of Mohammed II., commonly surnamed the Great. At the early age of twenty-one, Mohammed projected this conquest. His countrymen had already passed into Europe; they had possessed themselves of the city of Adrianople, and indeed had left nothing of all the empire of the East to the Greeks but the city of Constantinople itself. The preparations made for defence were not such as became the descendants of Romans, and the powers of Europe now looked upon the East with the most supine indifference. The Turks assailed the city both on the land side and on that of the sea; and battering down its walls with their cannon, entered sword in hand, and massacred all who opposed them (1453). Mohammed, like many other ambitious conquerors, showed himself unwilling to destroy unnecessarily. The imperial edifices were preserved, and the churches were converted into mosques: the exercise of their religion was freely allowed to the Christians, and this privilege they have never been deprived of. Constantine (for that was the name of the last, as well as the first emperor of the East) was slain in battle. From the time that it was founded by Constantine the Great, the city had subsisted 1123 years. Mohammed liberally patronised the arts and sciences. He was himself not only a politician, but a scholar, and he invited both artists and men of letters to his capital from the kingdoms of Europe. But the taking of Constantinople had an effect contrary to his wishes: it dispersed the learned Greeks, or Greeks who were called learned, all over Europe; and this, among other things, may be looked upon as a help to the great revival of letters which the fifteenth century witnessed. The taking of Constantinople was followed by the conquest of Greece and Epirus; and Italy might probably have met with a similar fate, but for the fleet of the Venetians, who opposed the arms of Mohammed with considerable success, and even attacked him in Greece; but the contending powers soon after put an end to hostilities by a treaty. By this time Europe was trembling at Mohammed's success, and was afraid, not without reason, that he might pursue his conquests westwards. It was relieved from fear by his death, which took place in 1481. His descendants have continued to our own day to occupy one of the finest countries in Europe; and it was only in the present age that Greece was liberated from their dominion.

#### RISE OF CIVIL FREEDOM AND SOCIAL IMPROVEMENT.

Civil freedom, as we have seen, dawned first in the great commercial cities of Italy, whence it spread to Germany, Flanders, and Britain. This important change in society may be traced to the institution of free communities of traders, or guilds of merchants; and such confederacies were a necessary consequence of the usurpation and tyranny of the nobles and feudal possessors of the soil. In the eleventh and twelfth centuries the usurpations of the nobility became intolerable; they had reduced the great body of the people to a state of actual servitude. Nor was such oppression the portion of those alone who dwelt in the coun-

try, and were employed in cultivating the estates of their masters. Cities and villages found it necessary to hold of some great lord, on whom they might depend for protection, and became no less subject to his arbitrary jurisdiction. The inhabitants were deprived of those rights which, in social life, are deemed most natural and inalienable. They could not dispose of the effects which their own industry had acquired, either by a later will, or by any deed executed during their lives. Neither could they marry, nor carry on lawsuits, without the consent of their lord. But as soon as the cities of Italy began to turn their attention towards commerce, and to conceive some idea of the advantages which they might derive from it, they became impatient to shake off the yoke of their insolent lords, and to establish among themselves such a free and equal government as would render property and industry secure. The Italian cities were the first to emancipate themselves, and their example was followed in other great seats of population, the king of the country in general countenancing the establishment of free communities, in order to gain support against the encroachments of the overgrown power of the barons. The first community of this description formed in Scotland is understood to have been that of Berwick-upon-Tweed, which received its charter from William the Lion. Towns, upon acquiring the right of community, became so many little republics, governed by known and equal laws. The inhabitants being trained to arms, and being surrounded by walls, they soon began to hold the neighbouring barons in contempt, and to withstand aggressions on their property and privileges. Another great good, of fully more importance, was produced. These free communities were speedily admitted, by their representatives, into the great council of the nation, whether distinguished by the name of a Parliament, a Diet, the Cortes, or the States-General. This is justly esteemed the greatest event in the history of mankind in modern times. Representatives from the English boroughs were first admitted into the great national council by the barons who took up arms against Henry III. in the year 1265; being summoned to add to the greater popularity of their party, and to strengthen the barrier against the encroachments of regal power. Readers may draw their own conclusions from an event which ultimately had the effect of revolutionising the framework of society, and of rearing that great body of the people commonly styled 'the middle class.'

The enfranchising of burghal communities led to the manumission of slaves. Hitherto the tillers of the ground, all the inferior classes of the country, were the bondsmen of the barons. The monarchs of France, in order to reduce the power of the nobles, set the example, by ordering (1315-1318) all serfs to be set at liberty on just and reasonable conditions. The edicts were carried into immediate execution within the royal domain. The example of their sovereigns, together with the expectation of considerable sums which they might raise by this expedient, led many of the nobles to set their dependents at liberty; and servitude was thus gradually abolished in almost every province of the kingdom. This beneficial practice similarly spread over the rest of Europe; and in England, as the spirit of liberty gained ground, the very name and idea of personal servitude, without any formal interposition of the legislature to prohibit it, was totally banished.

While society was assuming the semblance of the form it now bears, the progress of improvement was accelerated by various collateral circumstances, the first of which worth noticing was

*The Revival of Letters.* The first restorers of learning in Europe were the Arabians, who, in the course of their Asiatic conquests, became acquainted with some of the ancient Greek authors, discovered their merits, and had them translated into Arabic, esteeming those principally which treated of mathematics, physics, and metaphysics. They disseminated their knowledge in the course of their conquests, and founded schools and colleges in all the countries which they subdued. The

western kingdoms of Europe became first acquainted with the learning of the ancients through the medium of those Arabian translations. Charlemagne caused them to be retranslated into Latin; and, after the example of the caliphs, founded universities at Bonona, Pavia, Osnaburg, and Paris. Similar efforts were made in England by Alfred; and to him we owe the establishment, or at least the elevation, of the university of Oxford. The first efforts, however, at literary improvement were marred by the subtleties of scholastic divinity. Perhaps the greatest and wisest literary character of the middle ages was an English friar, named Roger Bacon. This extraordinary individual was not only learned, but, what was more uncommon in those times, he was scientific. Hallam asserts that he was acquainted with the nature of gunpowder, though he deemed it prudent to conceal his knowledge. He saw the insufficiency of school philosophy, and was the first to insist on experiment and the observation of nature as the fittest instruments by which to acquire knowledge. He reformed the calendar, and made discoveries in astronomy, optics, chemistry, medicine, and mechanics.

It is to Italy, however, that we owe the first and greatest exertions in the revival of letters. The spirit of liberty which had arisen among its republics was favourable to the cultivation of literature; and accordingly we find that not only did they produce many individuals who were most active and successful in bringing to light the relics of classical lore, but that there also arose among them men possessed of the highest order of original genius. Florence produced Dante so early as 1265. Dante was associated with the magistracy of his native city in his earlier years; but having given dissatisfaction in that capacity, he was banished, and in his exile produced his great poem entitled the 'Divine Comedy.' It is a representation of the three supposed kingdoms of futurity—Hell, Purgatory, and Paradise—divided into one hundred cantos, and containing about 14,000 lines. The poem has been much praised. Petrarch, born in the year 1304, was likewise a Florentine by birth. The misfortunes of his father had impoverished the family, and Petrarch was too proud to take the usual method of retrieving his affairs. His genius, however, earned for him the friendship of many Italian princes, and even of more popes than one, although he had exerted his talents to expose the vices of their courts. Petrarch's personal character seems to have exhibited some unamiable traits; but he has sung of love, friendship, glory, patriotism, and religion, in language of such sweetness and power as to have made him the admiration of every succeeding age. Boccaccio, like the two great poets named, was also a Florentine. He was born in 1313, and his name has descended to posterity less associated with his poetry than the light, elegant, and easy prose of his novels.

*The discovery of Justinian's Laws*, as detailed in the *Pandects* (see *HISTORY OF LAWS*), was another event which powerfully tended to modify the barbarism that prevailed during the middle ages in Europe.

*The invention of the Mariner's Compass* must be reckoned of still greater importance, and yet it is absolutely unknown to whom we owe it. That honour has been often bestowed on Gioia, a citizen of Amalphi, who lived about the commencement of the fourteenth century. But the polarity of the magnet at least was known to the Saracens two hundred years before that time; though even after the time of Gioia, it was long before the magnet was made use of as a guide in navigation. 'It is a singular circumstance,' says Mr Hallam, 'and only to be explained by the obstinacy with which men are apt to reject improvement, that the magnetic needle was not generally adopted in navigation till very long after the discovery of its properties, and even after their peculiar importance had been perceived. The writers of the thirteenth century, who mention the polarity of the needle, mention also its use in navigation; yet Campany has found no distinct proof of its employment till 1403, and does not believe that it was fre-

quently on board Mediterranean ships at the latter part of the preceding age.' The Genoese, however, are known in the fourteenth century to have come out of that inland sea, and steered for Flanders and England. But by far the greatest sailors of the age were the Spaniards and Portuguese. This latter nation had little or no existence during the greater part of the middle ages, but in the twelfth, thirteenth, and fourteenth centuries, they were able to expel the Moors from a great part of their country; and in the beginning of the fifteenth, John, surnamed the Bastard, who was then their king, was the first European prince who exhibited a respectable navy. It was in 1486 that this adventurous people first doubled the Cape of Good Hope.

*The discovery of America* (1493) may be mentioned supplementarily to the invention of the mariner's compass, as an event which, without it, could never have taken place. The immortal honour of that discovery rests with Christopher Columbus, a sailor of Genoa. After unsuccessful applications at almost every court in Europe, and braving obloquy and contempt, Columbus at last obtained a miserable force from Ferdinand and Isabella of Spain; and with no landmark but the heavens, nor any guide but his compass, he launched boldly into the sea, and at last conducted Europeans to the great western hemisphere.

In the course of the fourteenth and beginning of the fifteenth centuries, various discoveries in the arts were made, which powerfully tended to the advancement of society; among these the more important were the invention of gunpowder and firearms, clocks and watches, paper-making and printing. This last, the greatest of all, prepared the way for the Reformation in religion, in the sixteenth century, by which religion was added to civil freedom, and a great spur given to individual activity.

Important as these events were in their ultimate tendencies, it is to be remembered that they did not immediately make any distinct change in the comforts of the people. In the latter centuries of the middle ages, the amusements of the common people were metrical and prose romances, unintelligible prophecies, and fables of giants and enchanters. The state of England and of France at this period shows the small advance which had been made towards those comforts and improvements which now exist. Even in the large cities, the houses were roofed with thatch, and had no chimneys. 'The two most essential improvements in architecture during this period,' says Mr Hallam, 'one of which had been missed by the sagacity of Greece and Rome, were chimneys and glass windows. Nothing apparently can be more simple than the former; yet the wisdom of ancient times had been content to let the smoke escape by an aperture in the centre of the roof; and a discovery, of which Vitruvius had not a glimpse, was made, perhaps in this country [England], by some forgotten semi-barbarian. About the middle of the fourteenth century the use of chimneys is distinctly mentioned in England and in Italy; but they are found in several of our castles which bear a much older date. This country seems to have lost very early the art of making glass, which was preserved in Franca, whence artificers were brought into England to furnish the windows of some new churches in the seventh century. It is said that, in the reign of Henry III., few ecclesiastical buildings had glazed windows. Suger, however, a century before, had adorned his great work, the Abbey of St Denis, with windows not only glazed but painted; and I presume that other churches of the same class, both in France and England, were generally decorated in a similar manner. Yet glass is said not to have been employed in the domestic architecture of France before the fourteenth century, and its introduction into England was probably by no means earlier. Nor, indeed, did it come into general use during the period of the middle ages. Glazed windows were considered as movable furniture, and probably bore a high price. When the Earls of Northumberland, as late as the reign of Elizabeth, left Alnwick

Castle, the windows were taken out of their frames and carefully laid by.'

By far the finest specimens of architecture which the middle ages produced were the religious edifices built in the twelfth and three following centuries. The superstition of the times was favourable to the production of works of that sort. To leave one's means for such a purpose was deemed so meritorious, as to entitle the donor to eternal happiness in the next scene of existence; and men in this world thought it a duty to render structures designed for purposes so sacred as beautiful and becoming as they could. It was about the middle of the twelfth century that what has been called the Gothic style of architecture took its rise, of which the peculiar feature is thought to be the pointed arch, formed by the segment of two intersecting semi-circles, struck from points equidistant from the centre of a common diameter. This style of architecture has been said by different individuals to have originated in France, in Germany, in Italy, and in England (Vol. I. p. 438). The truth is, we neither know where it originated nor from what source it was derived. It has afforded antiquaries a curious subject of speculation how so perfect a system, as this has been thought, should not only have originated but reached perfection in times so dark. Any effectual explanation is probably now impossible; the knowledge of the art was never permitted to go beyond a fraternity of freemasons, and it is not to be supposed that the early archives of that association have survived so many revolutions.

The living even of the highest nobility under the Edwards was such as would not prove very palatable to their luxurious descendants. They drank little wine, had no foreign luxuries, rarely kept male servants except for husbandry, and still more rarely travelled beyond their native country. An income of £10 or £20 was reckoned a competent estate for a gentleman—at least the lord of a single manor would seldom have enjoyed more. A knight who possessed £150 a year passed for extremely rich. Sir John Fortescue speaks of five pounds a year as 'a fair living for a yeoman;' and we read that the same sum (£5) served as the annual expense of a scholar attending the university. Modern lawyers must be surprised at the following, which Mr Hallam extracts from the churchwarden's accounts of St Margaret, Westminster, for 1476:—'Also paid to Roger Fylpott, learned in the law, for his counsel giving, 3s. 8d., with fourpence for his dinner.'

It has been remarked that the wages of day-labourers, particularly those engaged in agriculture, were better in the times of Edward III. and Henry VI. than they have ever been at any other period of English history; nor can it be denied that this, upon the whole, is true. In the fourteenth century, a harvest man had fourpence a day, which enabled him in a week to buy a comb of wheat; but, says Sir John Cullum, in his History of Hawsted, to buy a comb of wheat a man must now (1784) work ten or twelve days. 'So,' says Mr Hallam, 'under Henry VI., if meat was at a farthing and a-half the pound, which, I suppose, was about the mark, a labourer earning threepence a day, or eighteenthpence in the week, could buy a bushel of wheat at six shillings the quarter, and twenty-four pounds of meat, for his family. A labourer at present earning twelve shillings a week, can only buy a bushel of wheat at eighty shillings the quarter, and twelve pounds of meat at sevenpence.' It is thus undeniable that the day-labourers' wages could purchase greater quantities of certain kinds of food than the wages given to the same class of persons could do in the present day, but they wanted a thousand comforts which the meanest of our workmen now enjoy; and few surely would be willing to exchange all these blessings for the wars and miseries which Edward caused, even although they were insured, along with them, of daily supplies of beef and ale, of which the ancient yeomen boasted.

The internal accommodation of houses was even less than their outward splendour. A gentleman's house containing three or four beds was thought to

be extraordinary well provided; few probably had more than two. The walls were commonly bare, without wainscot or even plaster, except that some great houses were furnished with hangings, and that perhaps hardly so soon as the reign of Edward VI. Neither books nor pictures could find a place in such dwellings as these. Some inventories of furniture, bearing dates in the fourteenth century, have been preserved to our own day, and they are curious and amusing. In Sir F. Eden's work on the State of the Poor, a carpenter's stock is said to have been valued, in the year 1301, at a shilling! In an inventory of the goods of 'John Port, late the king's servant,' who died about 1524, we find that this gentleman's house had consisted of a hall, parlour, buttery, and kitchen, with five bedsteads, two chambers, three garrets, and some minor accommodations. From this it may be inferred that Mr Port was a rather important man in his day, for very few individuals at that time could boast of such accommodation. His plate was valued at £94, his jewels at £23; and, strange to say, his funeral expenses amounted to £73, 6s. 8d!

Of all the arts necessary to existence, perhaps that of agriculture was in the most miserable condition during the middle ages. On a thousand spots of land which we now behold subjected to a fruitful cultivation, there was nothing to be seen at that time but 'tracts of forest ground, stagnating with bog or darkened by native woods, where the wild ox, the roe, the stag, and the wolf, had scarcely learned the supremacy of man.' We owe the first efforts at improvement in agriculture over the greater part of Europe to the monks. They chose, for the sake of retirement, secluded regions, which they cultivated with the labour of their hands. 'Of the Anglo-Saxon husbandry we may remark,' says Mr Turner, 'that Doom's-day Survey gives us some indication that the cultivation of the church lands was much superior to that of any other. They had much less wood upon them, and their meadow was more abundant, and in more numerous distributions.' The culture of arable land in general was very imperfect: according to Sir John Cullum, a full average crop on an acre sown with wheat amounted only to about nine or ten bushels—a circumstance, the knowledge of which may save us any surprise at a calculation by which it appears that, in the thirteenth century, the average annual rent of an acre of arable land was from sixpence to a shilling. In the time of Edward I., the ordinary price of a quarter of wheat appears to have been about four shillings. A sheep was sold high at a shilling, and an ox might be reckoned at ten or twelve. In considering these statements, however, of positive money values, it must be recollected by persons of this day that the precious metals were depreciated progressively in their value by every sovereign in Europe, who enabled themselves in this way to pay debts in appearance, while in reality they were cheating their creditors to that extent; and sums of small name in those days were every way equal in value to greater sums in our own.

At this time wine was sold only in the shops of the English apothecaries. Yet the progress of luxury, as it was called, had already begun to excite serious alarm. The parliament of Edward III. passed an act prohibiting the use of gold and silver in apparel to all who had not a hundred pounds a year; and Charles VI. of France ordained that none should presume to entertain their guests with more than two dishes and a mess of soup. It is almost unnecessary to add, that laws of that sort were passed only with a view to persons in the highest ranks; for others they were not needed. Contemporary history has recorded nothing of the poorer classes but their slaughter in war; but we are at little loss to perceive that domestic comforts must have been few and slender among them, when we know that neither chairs nor looking-glasses could be found in the bedrooms of the nobility. Ages over which this sketch does not extend, were required before the great mass of human beings should become possessed of personal comforts or of political rights.

# HISTORY OF GREAT BRITAIN AND IRELAND.

CONQUEST BY THE ROMANS.

PREVIOUSLY to the year 55 before Christ, the British Islands, in common with the whole of northern and western Europe, were occupied by barbarous tribes, who bore nearly the same relation to the civilised nations of Greece and Italy, which the North American Indians of the present day bear to the inhabitants of Great Britain and the United States. The Romans, who for ages had been extending their power over their rude neighbours, had concluded the conquest of Gaul, now called France, when, in the year just mentioned, their celebrated commander, Julius Cæsar, learning from the merchants of that country that there was another fertile land on the opposite side of the narrow sea now termed the British Channel, resolved to proceed thither, and subject it also to the Roman arms. Disembarking at the place since called Deal, he soon overawed the savage natives, though they were naturally warlike, and averse to a foreign yoke. He did not, however, gain a firm footing in Britain till the succeeding year, when he employed no fewer than 800 vessels to convey his troops from Gaul. Except along the coasts, where some tillage prevailed, the British tribes lived exactly as the Indians now do, upon animals caught in hunting, and fruits which grew spontaneously. They stained and tattooed their bodies, and had no religion but a bloody idolatry called Druidism. The people of Ireland were in much the same condition.

Little was done on this occasion to establish the Roman power in Britain; but about a century afterwards—namely, in the year of Christ 43, when the Emperor Claudius was reigning at Rome—another large army invaded the island, and reduced a considerable part of it. A British prince called Caradoc, or Caracacus, who had made a noble defence against their arms, was finally taken and sent prisoner to Rome, where he was regarded with the same wonder as we should bestow upon a North American chief who had greatly obstructed the progress of our settlements in that quarter of the world. In the year 61, an officer named Suetonius did much to reduce the Britons, by destroying the numerous Druidical temples in the Isle of Anglesea; religion having in this case, as in many others since, been a great support to the patriotic cause. He soon after overthrew the celebrated British princess Boudicca, who had raised an almost general insurrection against the Roman power.

In the year 79, Agricola, a still greater general, extended the influence of Rome to the Firths of Forth and Clyde, which he formed into a frontier, by connect-

ing them with a chain of forts. It was his policy, after he had subdued part of the country, to render it permanently attached to Rome, by introducing the pleasures and luxuries of the capital. He was the first to sail round the island. In the year 84, having gone beyond the Forth, he was opposed by a great concourse of the rude inhabitants of the north, under a chief named Galgacus, whom he completely overthrew at *Mons Grampius*, or the Grampian Mountain; a spot about which there are many disputes, but which was probably at Ardoch in Perthshire, where there are still magnificent remains of a Roman camp. Tacitus, a writer related to Agricola, gives a very impressive account of this great conflict, and exhibits the bravery of the native forces as very remarkable; but the correctness of his details cannot be much relied on.

It appears that Agricola, while on the west coast of Scotland, was desirous of making the conquest of Ireland, which he thought would be useful, both as a medium of communication with Spain, and as a position whence he could overawe Britain. He formed an acquaintance with an Irish chief, who, having been driven from his country by civil commotions, was ready to join in invading it. By him Agricola was informed that the island might be conquered by one legion and a few auxiliaries. The inhabitants, according to Tacitus, bore a close resemblance to the Britons.

It is generally allowed that the Romans experienced an unusual degree of difficulty in subduing the Britons; and it is certain that they were baffled in all their attempts upon the northern part of Scotland, which was then called Caledonia. The utmost they could do with the inhabitants of that country, was to build walls across the island to keep them by themselves. The first wall was built in the year 121, by the Emperor Hadrian, between Newcastle and the Solway Firth. The second was built by the Emperor Antoninus, about the year 140, as a connexion of the line of forts which Agricola had formed between the Firths of Forth and Clyde. This boundary was not long kept, for in 210 we find the Emperor Severus fortifying the rampart between the Tyne and Solway. Roman armies, however, probably under the command of Lollius Urbicus, had penetrated far beyond the more northerly wall, although, unfortunately, no accounts of their reception are preserved. From comparing Roman remains lately discovered with ancient geographies, it is held as established that the Romans reached the north-east end of Loch Ness, near the modern town of Inverness. The number of roads and camps which they made, and the regularity with which the country was divided into stations, prove their desire to preserve these conquests. When the conquest was thus so far completed, the country was governed in the usual manner of a Roman province; and towns began to rise in the course of time—being generally those whose names are now found to end in *chester*, a termination derived from *castra*, the Latin word for a camp. The Christian religion was also introduced, and Roman literature made some progress in the country.

## CONQUEST BY THE SAXONS.

At length a time came when the Romans could no longer defend their own native country against the nations in the north of Europe. The soldiers were then withdrawn from Britain (about the year 440), and the people left to govern themselves. The Caledonians, who did not like to be so much straitened in the north, took advantage of the unprotected state of the Britons to pour in upon them from the other side of the wall, and despoil them of their lives and goods. The British had no resource but to call in another set of protectors,

the Saxons, a warlike people who lived in the north of Germany, and the Jutes and Angles, who inhabited Denmark. The remedy was found hardly any better than the disease. Having once acquired a footing in the island, these hardy strangers proceeded to make it a subject of conquest, as the Romans had done before, with this material difference, that they drove the British to the western parts of the island, particularly into Wales, and settled, with new hordes of their countrymen, over the better part of the land. So completely was the population changed, that, excepting in the names of some of the hills and rivers, the British language was extinguished, and even the name of the country itself was changed from what it originally was to Angle-land, or England, a term taken from the Angles. The conquest required about a hundred and fifty years to be effected, and, like that of the Romans, it extended no farther north than the Firths of Forth and Clyde. Before the Britons were finally cooped up in Wales, many battles were fought; but few of these are accurately recorded. The most distinguished of the British generals were the Princes Vortimer and Aurelius Ambrosius. It is probably on the achievements of the latter that the well-known fables of King Arthur and his knights are founded.

England, exclusive of the western regions, was now divided into seven kingdoms, called Kent, Northumberland, East Anglia, Mercia, Essex, Sussex, and Wessex, each of which was governed by a race descended from the leader who had first subdued it; and the whole have since been called by historians the *Saxon Heptarchy*, the latter word being composed of two Greek words, signifying *seven kingdoms*. To the north of the Forth dwelt a nation called the Picts, who also had a king, and were in all probability the people with whom Agricola had fought under the name of Caledonians. In the Western Highlands there was another nation, known by the name of the Scots, or Dalriads, who had gradually migrated thither from Ireland, between the middle of the third century and the year 503, when they established, under a chief named Fergus, a monarchy destined in time to absorb all the rest. About the year 700 there were no fewer than fifteen kings, or chiefs, within the island, while Ireland was nearly in the same situation. In Britain, at the same time, five languages were in use, the Latin, Saxon, Welsh, the Pictish, and the Irish. The general power of the country has been found to increase as these nations and principalities were gradually amassed together.

Although three of the Saxon kingdoms, Wessex, Mercia, and Northumberland, became predominant, the Heptarchy prevailed from about the year 585 to 800, when Egbert, king of Wessex, acquired a paramount influence over all the other states, though their kings still continued to reign. Alfred, so celebrated for his virtues, was the grandson of Egbert, and began to reign in the year 871. At this time the Danes, who are now a quiet, inoffensive people, were a nation of pirates, and at the same time heathens. They used to come in large fleets, and commit dreadful ravages on the shores of Britain. For some time they completely overturned the sovereignty of Alfred, and compelled him to live in obscurity in the centre of a marsh. But he at length fell upon them when they thought themselves in no danger, and regained the greater part of his kingdom. Alfred spent the rest of his life in literary study, of which he was very fond, and in forming laws and regulations for the good of his people. He was perhaps the most able, most virtuous, and most popular prince that ever reigned in Britain; and all this is the more surprising, when we find that his predecessors and successors, for many ages, were extremely cruel and ignorant. He died in the year 901, in the fifty-third year of his age.

#### CONQUEST BY THE NORMANS.

The Saxon line of princes continued to rule—with the exception of three Danish reigns—till the year 1066, when the crown was in the possession of a usurper

named Harold. The country was then invaded by William, Duke of Normandy, a man of illegitimate birth, attended by a large and powerful army. Harold opposed him at Hastings (October 14), and after a well-contested battle, his army was defeated, and himself slain. William then caused himself to be crowned king at Westminster; and in the course of a few years he succeeded, by means of his warlike Norman followers, in completely subduing the Saxons. His chiefs were settled upon the lands of those who opposed him, and became the ancestors of most of the present noble families of England.

Previously to this period, the church of Rome, which was the only surviving part of the power of that empire, had established its supremacy over England. The land was also subjected to what is called the feudal system (see HISTORY OF THE MIDDLE AGES), by which all proprietors of land were supposed to hold it from the king for military service, while their tenants were understood to owe them military service in turn for their use of the land. All orders of men were thus kept in a chain of servile obedience, while some of the lower orders were actually slaves to their superiors.

In the year 853, Kenneth, king of the Scots, had added the Pictish kingdom to his own, and his descendant Malcolm II., in 1020, extended his dominions over not only the south of Scotland, but a part of the north of England. Thus, putting aside Wales, which continued to be an independent country, under its own princes, the island was divided, at the time of the Norman Conquest, into two considerable kingdoms, England and Scotland, as they were for some centuries afterwards. Ireland, which had also been invaded by hordes from the north of Europe, was divided into a number of small kingdoms, like England under the Saxon Heptarchy.

#### EARLY NORMAN KINGS.

William, surnamed *The Conqueror*, reigned from 1066 to 1087, being chiefly engaged all that time in completing the subjugation of the Saxons. He is allowed to have been a man of much sagacity, and a firm ruler; but his temper was violent, and his dispositions brutal. At the time of his death, which took place in Normandy, his eldest son Robert happening to be at a greater distance from London than William, who was the second son, the latter individual seized upon the crown, of which he could not afterwards be dispossessed, till he was shot accidentally by an arrow in the New Forest, in the year 1100. Towards the close of this king's reign, the whole of Christian Europe was agitated by the first Crusade—an expedition for the recovery of the Holy Land from the Saracens. Robert of Normandy had a high command in this enterprise, and gained much fame as a warrior; but while he was in Italy, on his return, his youngest brother Henry usurped the throne left vacant by William, so that he was again disappointed of his birthright. HENRY I.—surnamed *Beauclerc*, from his being a fine scholar—was a prince of some ability; but he disgraced himself by putting out the eyes of his eldest brother, and keeping him nearly thirty years in confinement. Such barbarous conduct shows that in this age might was the only right, and that men hesitated at no actions which might promise to advance their own interests.

Contemporary with William the Conqueror in England, was MALCOLM III. in Scotland, surnamed *Cusmore*, from his having a large head. This prince, after overthrowing the celebrated usurper Macbeth, married Margaret, a fugitive Saxon princess, through whom his posterity became the heirs of that race of English sovereigns. He was a good prince, and by settling Saxon refugees upon his lowland territory, did much to improve the character of the Scottish nation, who are described as having been before this time a nation in which there was no admixture of civilisation. At Malcolm's death, in 1093, the crown was contested for a while by a usurper called Donald Bane, and the elder sons of the late monarch, but finally fell to the

peaceable possession of his youngest son DAVID I., who was a prince of much superior character, apparently, to the Norman sovereigns who lived in the same age. The church of Rome having now gained an ascendancy in Scotland, David founded a considerable number of monasteries and churches for the reception of the ministers of that religion. All the most celebrated abbeys in Scotland took their rise in his time.

Henry Beauclerc of England, in order to strengthen his claim by a Saxon alliance, married Maud, the daughter of Malcolm Canmore and of the Princess Margaret. By her he had an only daughter of the same name, whom he married first to the Emperor of Germany, and then to Geoffrey Plantagenet, eldest son of the Earl of Anjou, in France. This lady, and her children by Plantagenet, were properly the heirs of the English crown; but on the death of Henry, in 1135, it was seized by a usurper named STEPHEN, a distant member of the Conqueror's family, who reigned for nineteen years, during which the country was rendered almost desolate by civil contests, in which David of Scotland occasionally joined.

On the death of Stephen, in 1154, the crown fell peacefully to HENRY II., who was the eldest son of Maud, and the first of the Plantagenet race of sovereigns. Henry was an acute and politic prince, though not in any respect more amiable than his predecessors. His reign was principally marked by a series of measures for reducing the power of the Romish clergy, in the course of which some of his courtiers, in 1171, thought they could not do him a better service than to murder Thomas-à-Becket, Archbishop of Canterbury, who had been the chief obstacle to his views, and was one of the ablest and most ambitious men ever produced in England. For his concern in this foul transaction, Henry had to perform a humiliating penance, receiving eighty lashes on his bare back from the monks of Canterbury. We are the less inclined to wonder at this circumstance, when we consider that about this time the Pope had power to cause two kings to perform the menial service of leading his horse.

Henry was the most powerful king that had yet reigned in Britain. Besides the great hereditary domains which he possessed in France, and for which he did homage to the king of that country, he exacted a temporary homage from William of Scotland, the grandson of David, a monarch of great valour, who took the surname of *the Lion*, and who reigned from 1166 to 1214. Henry also added Ireland to his dominions. This island had previously been divided into five kingdoms—Munster, Leinster, Meath, Ulster, and Connaught. The people, being quite uncivilised, were perpetually quarrelling among themselves; and this, with their heathen religion, furnished a flimsy pretext for invading them from England. Dermot Macmorrough, king of Leinster, having been dethroned by his subjects, introduced an English warrior, Richard, Earl of Strigul, generally called *Strongbow*, for the purpose of regaining his possessions. A body composed of 50 knights, 90 esquires, and 460 archers, in all 600 men, was enabled by its superior discipline to overthrow the whole warlike force that could be brought against them; and the conquest was easily completed by Henry in person, who went thither in 1172. The military leaders were left to rule over the country; but they managed their trust so ill, that the Irish never became peaceable and improving subjects of the Norman king, as the English had gradually done.

RICHARD CŒUR DE LION—JOHN—MAGNA CHARTA.

Henry II. was much troubled in his latter years by the disobedience of his children. At his death, in 1189, he was succeeded by his son RICHARD, styled *Cœur de Lion*, or the *Lion-hearted*, from his headstrong courage, and who was much liked by his subjects on that account, though it does not appear that he possessed any other good qualities. At the coronation of Richard, the people were permitted to massacre many thousands of unoffending Jews throughout the kingdom. Almost

immediately after his accession, he joined the king of France in a second Crusade; landed in Palestine (1191), and fought with prodigious valour, but with no good result. On one occasion, being offended at a breach of truce by his opponent Saladin, he beheaded 5000 prisoners; whose deaths were immediately revenged by a similar massacre of Christian prisoners. In 1192, he returned with a small remnant of his gallant army, and being shipwrecked at Aquileia, wandered in disguise into the dominions of his mortal enemy the Duke of Austria, who, with the Emperor of Germany, detained him till he was redeemed by a ransom, which impoverished nearly the whole of his subjects. This prince spent the rest of his life in unavailing wars with Philip of France, and was killed at the siege of a castle in Limousin, in 1199, after a reign of ten years, of which he had spent only about three months in England.

JOHN, the younger brother of Richard, succeeded, although Arthur, Duke of Bretagne, the son of an intermediate brother, was the proper heir. John, who was at once vain, cruel, and weak, alienated the affections of his subjects almost at the very first by the assassination of his nephew, which he is said to have performed with his own hands. The weakness of kings is often the means of giving increased liberties and privileges to the people. The paltry tyranny and wickedness of John caused his barons to rise against him, and the result was, that, on the 19th June 1215, he was compelled by them to sign what is called the *Magna Charta*, or Great Charter, granting them many privileges and exemptions, and generally securing the personal liberty of his subjects. The principal point concerning the nation at large was, that no tax or supply should be levied from them without their own consent in a Great Council—the first idea of a Parliament. Some excellent provisions were also made regarding courts of law and justice, so as to secure all but the guilty.

The Pope, it appears, regarded the *Magna Charta* as a shameful violation of the royal prerogative, and excommunicated its authors, as being worse, in his estimation, than infidels. The opinion of a leading modern historian is very different. He says, 'To have produced the Great Charter, to have preserved it, to have matured it, constitute the immortal claim of England on the esteem of mankind.'

HENRY III.—ORIGIN OF PARLIAMENT.

John, at his death in 1216, was succeeded by his son, HENRY III., a weak and worthless prince, who ascended the throne in his boyhood, and reigned fifty-six years, without having performed one worthy act of sufficient consequence to be detailed. In his reign was held the first assemblage approaching to the character of a Parliament. It was first called in 1225, in order to give supplies for carrying on a war against France. The money was only granted on condition that the Great Charter should be confirmed; and thus the example was set at the very first, for rendering supplies a check upon the prerogative of the king, and gradually reducing that power to its present comparatively moderate level. Under the earlier Norman kings, and even, it is believed, under the Saxons, an assembly called the Great Council had shared with the sovereign the power of framing laws; but it was only now that the body had any power to balance that of the sovereign, and it was not till 1265 that representatives from the inhabitants of towns were introduced.

EDWARD I. AND II.—ATTEMPTED CONQUEST OF SCOTLAND.

Henry III., at his death in 1272, was succeeded by his son EDWARD I., a prince as warlike and sagacious as his father was the reverse. He distinguished himself by his attempts to add Wales to his kingdom, an object which he accomplished in 1282, by the overthrow and murder of Llewellen, the last prince of that country. In the meantime, from the death of William the Lion in 1214, Scotland had been ruled by two princes, ALEXANDER II. and III., under whom it advanced considerably in wealth, civilisation, and comfort. On the death

of Alexander III., in 1285, the crown fell to his granddaughter MARGARET, a young girl, whose father was Eric, king of Norway. Edward formed a treaty with the Estates of Scotland for a marriage between this princess and his son, whom he styled Prince of Wales. Unfortunately, the young lady died on her voyage to Scotland; and the crown was left to be disputed by a multitude of distant relations, of whom JOHN BALIOL and ROBERT BRUCE seemed to have the best right. Edward, being resolved to make Scotland his own at all hazards, interfered in this dispute, and being appointed arbitrator among the competitors, persuaded them to own in the first place an ill-defined claim put forward by himself of the right of paramountcy or superior sovereignty over Scotland. When this was done, he appointed Baliol to be his vassal king, an honour which the unfortunate man was not long permitted to enjoy. Having driven Baliol to resistance, he invaded the country, overthrew his army, and stripping him of his sovereignty, assumed to himself the dominion of Scotland, as a right forfeited to him by the rebellion of his vassal. After he had retired, a brave Scottish gentleman, named William Wallace, raised an insurrection against his officers, and defeating his army at Stirling in 1298, cleared the whole country of its southern invaders. But in the succeeding year, this noble patriot was defeated by Edward in person at Falkirk, and the English yoke was again imposed. It may be remarked, that this could have hardly taken place if the common people, who rose with Wallace, and who were wholly of Celtic and Saxon origin, had been led and encouraged by the nobility. The grandees of Scotland, and even the competitors for the crown, being recent Norman settlers, were disposed to render obedience to the English sovereign.

Some time after the death of Wallace, while Edward was engrossed with his French wars, ROBERT BRUCE, Earl of Carrick, grandson of him who had competed with Baliol, conceived the idea of putting himself at the head of the Scots, and endeavouring by their means at once to gain the crown, and to recover the independence of the kingdom. After a series of adventures, among which was the unpremeditated murder of a rival named Comyn, Bruce caused himself, in 1306, to be crowned at Scone. For some time after he had to skulk as a fugitive, being unable to maintain his ground against the English officers; but at length he became so formidable, that Edward found it necessary (1307) to lead a large army against him. The English monarch, worn out with fatigue and age, died on the coast of the Solway Firth, when just within sight of Scotland, leaving his sceptre to his son EDWARD II. That weak and foolish prince immediately returned to London, leaving Bruce to contest with his inferior officers.

After several years of constant skirmishing, during which the Scottish king was able to maintain his ground, Edward resolved to make one decisive effort to reduce Scotland to subjection. In the summer of 1314, he invaded it with an army of 100,000 men. Bruce drew up his troops, which were only 30,000 in number, at Bannockburn, near Stirling. Partly by steady valour, and partly by the use of stratagems, the Scots were victorious, and Edward fled ignominiously from the field. The Scottish king gained an immense booty, besides securing his crown and the independence of his country. He soon after sent his brother Edward, with a body of troops, to Ireland, to assist the native chiefs in resisting the English. This bold young knight was crowned King of Ireland, and for some time held his ground against the English forces, but was at length defeated and slain.

The weakness of Edward II. was chiefly shown in a fondness for favourites, into whose hands he committed the whole interests of his people. The first was a low Frenchman, named Piers Gaveston, who soon fell a victim to the indignation of the barons. The second, Hugh Spencer, misgoverned the country for several years, till at length the Queen and Prince of Wales raised an insurrection against the king, and caused him

to be deposed, as quite unfit to reign. The Prince was then crowned as EDWARD III. (1327), being as yet only about fourteen years of age; and in the course of a few months the degraded sovereign was cruelly put to death in Berkeley Castle.

During the minority of the young king, the reins of government were held by his mother and the Earl of March. Under their administration, a peace was concluded with King Robert of Scotland, of which one of the conditions was a full acknowledgment of the independence of the Scottish monarchy, which had been a matter of dispute for some ages.

#### EDWARD III.—RICHARD II.

Edward III., who soon after assumed full power, was destined to make good the remark prevalent at this time, that the kings of England were alternately able and imbecile. He was a warlike and sagacious monarch, and inspired by all his grandfather's desire of conquest. In 1329, Robert Bruce died, and was succeeded by his infant son DAVID II., to whom a young sister of the English king was married, in terms of the late treaty. Notwithstanding this connection, Edward aided a son of John Baliol in an attempt to gain the Scottish crown. Edward Baliol overthrew the Regent of Scotland at Duplin, September 1332, and for two months reigned as King of Scots, while David and his wife took refuge in France. Though now expelled, Baliol afterwards returned to renew his claims, and for many years the country was harassed by unceasing wars, in which the English took a leading part.

But for his attention being diverted to France, Edward III. would have made a more formidable effort to subdue Scotland, and might have succeeded. He was led into a long course of warfare with France, in consequence of an absurd pretension which he made to its crown. In the victories which he gained at Cressy (August 26, 1346) and Poitiers (September 17, 1356), the national valour, his own, and that of his celebrated son, the Black Prince, were shown conspicuously; but this lavish expenditure of the resources of his kingdom, in which he was supported by his parliament, was of no permanent benefit, even to himself, for whom alone it was made. In those days, almost all men fought well, but very few had the art to improve their victories. John, king of France, who had been made captive at Poitiers, and David, king of Scotland, who had been taken in 1346, while conducting an invasion of England, were at one time prisoners in England; but no permanent advantage was ever gained over either of the states thus deprived of their sovereigns. In 1361, after about twenty years of active fighting, the English king left France with little more territory than he had previously enjoyed. Edward had invaded Scotland with a powerful army in 1356, but without making any impression. The Scots, under David's nephew, Robert Stewart, effectually protected themselves, not only from his arms, but from a proposal which David himself basely undertook to make, that Lionel, the third son of the English king, should be acknowledged as his successor. Edward died in 1377, a year after the decease of his son the Black Prince; and notwithstanding all their brilliant exploits, the English territories in France were less than at the beginning of the reign.

England was at this time affected more than at any other by the fashions of chivalry. This was a military enthusiasm, which for some centuries pervaded all Christian Europe. It prompted, as one of its first principles, a heedless bravery in encountering all kinds of danger. Its votaries were expected to be particularly bold in behalf of the fair sex, insomuch that a young knight would sometimes challenge to mortal combat any one who denied his mistress to be the loveliest in the world. Tournaments were held, at which knights clad in complete armour would ride against each other at full speed with levelled lances, merely to try which had the greatest strength and skill; and many were killed on these occasions. It was a system full of extravagance, and tending to bloodshed; but neverthe-

less it maintained a certain courtesy towards females, and a romantic principle of honour, which we may be glad to admire, considering how rude was almost every other feature of the age.

Edward III. was succeeded by his grandson, RICHARD II., then a boy of eleven years of age, and who proved to be a person of weak and profligate character. The Commons took advantage of the irregularity of his government to strengthen their privileges, which they had with difficulty sustained during the more powerful rule of his predecessor. Early in this reign they assumed the right, not only of taxing the country, but of seeing how the money was spent. Indignant at the severity of a tax imposed upon all grown-up persons, the peasantry of the eastern parts of England rose, in 1381, under a person of their own order, named Wat Tyler, and advanced, to the number of 60,000, to London, where they put to death the chancellor and primate, as evil counsellors of their sovereign. They demanded the abolition of bondage, the liberty of buying and selling in fairs and markets, a general pardon, and the reduction of the rent of land to an equal rate. The king came to confer with them at Smithfield, where, on some slight pretence, Walworth, mayor of London, stabbed Wat Tyler with a dagger—a weapon which has since figured in the armorial bearings of the metropolis. The peasants were dismayed, and submitted, and no fewer than fifteen hundred of them were hanged. Wat Tyler's insurrection certainly proceeded upon a glimmering sense of those equal rights of mankind which have since been generally acknowledged; and it is remarkable, that at the same time the doctrines of the reformer Wickliffe were first heard of. This learned ecclesiastic wrote against the power of the Pope, and some of the most important points of the Romish faith, and also executed a translation of the Bible into English. His writings are acknowledged to have been of material, though not immediate effect, in bringing about the reformation of religion.

The country was misgoverned by Richard II. till 1399, when he was deposed by his subjects under the leading of his cousin, Henry, Duke of Lancaster. This person, though some nearer the throne were alive, was crowned as HENRY IV., and his predecessor, Richard, was soon after murdered. In the meantime, David of Scotland died in 1371, and was succeeded by ROBERT STEWART, who was the first monarch of that family. ROBERT I., dying in 1389, was succeeded by his son ROBERT II., who was a good and gentle prince. He had two sons, David and James: the former was starved to death by his uncle, the Duke of Albany; and the latter, when on his way to France for his education, was seized by Henry IV. of England, and kept captive in that country for eighteen years. Robert II. then died of a broken heart (1406), and the kingdom fell into the hands of the Duke of Albany, at whose death, in 1419, it was governed by his son Duke Murdoch, a very imbecile personage.

HOUSE OF LANCASTER.

Henry IV. proved a prudent prince, and comparatively a good ruler. The settlement of the crown upon him by parliament was a good precedent, though perhaps only dictated under the influence of his successful arms. He was much troubled by insurrections, particularly a formidable one by Percy, Earl of Northumberland—and one still more difficult to put down in Wales, where Owen Glendower, a descendant of the British princes, kept his ground for several years.

On the death of Henry IV. in 1413, he was succeeded by his son, who was proclaimed under the title of HENRY V. The young king attained high popularity, on account of his impartial administration of justice, and his zeal to protect the poor from the oppressions of their superiors. His reign is less agreeably marked by the persecutions of the Lollards, a body of religious reformers, many of whom were condemned to the flames. Being determined to use every endeavour to gain the crown of France, which he considered his by

right of birth, he landed in Normandy with 80,000 men (August 1415), and gave battle to a much superior force of the French at Agincourt. He gained a complete victory, which was sullied by his afterwards ordering a massacre of his prisoners, under the apprehension that an attempt was to be made to rescue them. The war was carried on for some years longer, and Henry would have probably succeeded in making good his claim to the French crown, if he had not died prematurely of a dysentery (August 31, 1422), in the thirty-fourth year of his age, leaving the throne to an infant nine months old, who was proclaimed as HENRY VI., King of France and England.

Under Henry VI., whose power was for some time in the hands of his uncle the Duke of Bedford, the English maintained their footing in France for several years, and at the battle of Verneuil, in 1424, rivalled the glory of Cressy and Poitiers. At that conflict, a body of Scotch, 7000 strong, who had proved of material service to the French, were nearly cut off. In 1428, when France seemed completely sunk beneath the English rule, the interests of the native prince were suddenly revived by a simple maiden, named Joan of Arc, who pretended to have been commissioned by Heaven to save her country; and entering into the French army, was the cause of several signal reverses to the English. By her enthusiastic exertions, and the trust everywhere reposed in her supernatural character, Charles VII. was crowned at Rheims in 1430. Being soon after taken prisoner, the heroic maiden was, by the English, condemned for witchcraft, and burnt. Nevertheless, about the year 1453, the French monarch had retrieved the whole of his dominions from the English, with the exception of Calais.

Henry VI. was remarkable for the extreme weakness of his character. His cousin, Richard, Duke of York, descended from an elder son of Edward III., and therefore possessed of a superior title to the throne, conceived that Henry's imbecility afforded a good opportunity for asserting what he thought his birthright. Thus commenced the famous *Wars of the Roses*, as they were called, from the badges of the families of York and Lancaster—the former of which was a red, while the latter was a white rose. In 1454, the duke gained a decisive victory over the forces of Henry, which were led by his spirited consort, Margaret of Anjou. In some succeeding engagements the friends of Henry were victorious; and at length, in the battle of Wakefield (December 24, 1460), the forces of the Duke of York were signally defeated, and himself, with one of his sons, taken and put to death. His pretensions were then taken up by his eldest son Edward, who, with the assistance of the Earl of Warwick, gained such advantages next year, that he assumed the crown. Before this was accomplished, many thousands had fallen on both sides. Henry, who cared little for the pomp of sovereignty, was confined in the Tower.

Scotland, in the meantime (1424), had redeemed her king from his captivity in England; and that prince, styled JAMES I., had proved a great legislator and reformer, not to speak of his personal accomplishments in music and literature, which surpassed those of every contemporary monarch. James did much to reduce the Highlands to an obedience under the Scottish government, and also to break up the enormous power of the nobles. By these proceedings, however, he excited a deep hatred in the bosoms of some of his subjects; and in 1437 he fell a victim to assassination at Perth. He was succeeded by his infant son, JAMES II., the greater part of whose reign was spent in a harassing contention with the powerful house of Douglas, and who was finally killed, in the flower of his age, by the bursting of a cannon before Roxburgh Castle. His successor, JAMES III., was also a minor, and, on reaching man's estate, proved to be a weak, though not ill-meaning prince. He fell a victim, in 1488, to a conspiracy formed by his subjects, and which was led by his eldest son. The morality of princes in this age seems to have been much upon a par with that ascribed

to the Turkish sovereigns of a later period. They never scrupled to destroy life, either within the circle of their own family, or out of it, when it suited their interests or their ambition to do so.

HOUSE OF YORK.

Edward, of the House of York, styled EDWARD IV., who commenced his reign in the nineteenth year of his age, reigned ten years, perpetually disturbed by renewed attempts of the Lancastrian party, of which he mercifully sacrificed many thousands who fall into his hands. At length, having offended the Earl of Warwick, who had been chiefly instrumental in placing him upon the throne, that powerful nobleman raised an insurrection against him, and in eleven days was master of the kingdom, while Edward had to take refuge on the continent. Henry VI. was then restored, and Warwick acquired the title of King-maker. Nine months after (1471), Edward landed with a small body of followers, and having called his partisans around him, overthrew and killed Warwick at St Alban's. Margaret of Anjou, who had fought battles for her husband in almost every province of England, gathered a new army, and opposed Edward at Tewkesbury Park, where she was completely defeated. Her son and husband being taken, were murdered in cold blood, and she herself spent the remainder of her singular life in France. Edward reigned, a profligate and a tyrant, till 1483, when he died in the forty-second year of his age. He had previously caused his brother, the equally profligate Duke of Clarence, to be drowned in a butt of malmsey wine.

During the reign of Edward IV., the plague frequently broke out in England, and carried off immense numbers of the people. It was particularly fatal in London, and in all other places where many houses were huddled closely together, with imperfect means of cleaning and ventilation. It was calculated that the disease, on one occasion in this reign, destroyed as many lives as the fifteen years' war. The plague did not cease to occur in England, as well as in other European countries, until considerable improvements had taken place in the habits of the people, especially in point of cleanliness.

EDWARD V., the eldest son of Edward IV., was a boy of eleven years when he succeeded to the crown. His uncle, Richard, Duke of Gloucester, a wicked and deformed wretch, soon after contrived to obtain the chief power, and also to cause the murder of the young king and his still younger brother in the Tower. He then mounted the throne under the title of RICHARD III. For two years, this disgrace to humanity continued to reign, though universally abhorred by his people. At length, in 1485, Henry Tudor, Earl of Richmond, a connexion rather than a descendant of the Lancaster family, resolved to make an attempt upon the English crown. Having landed with about 2000 followers at Milford Haven, he advanced into the country, and speedily gained such accessions of force as enabled him to meet and overthrow Richard at Bosworth Field, where the tyrant was slain, and the victorious Richmond was immediately proclaimed king, under the title of HENRY VII. The new monarch soon after sought to strengthen his title by marrying Elisabeth, the daughter and heir of Edward IV., by which it was said the families of York and Lancaster were united.

HOUSE OF TUDOR—HENRY VII.

Under Henry VII. the country revived from the evils of a long civil war, in the course of which the chief nobility had been broken down, and the industry and commerce of the land interrupted. It was remarkable, nevertheless, that, during the past period, England was upon the whole an improving country. The evils of war had fallen chiefly on those who made it; the government, however disturbed by various claimants of the throne, was mild and equitable—at least as compared with that of other countries; and the people at large throve under a system in which their own consent, by the voice of the House of Commons, was

necessary to the making of every new law, and the laying on of every tax.

The reign of Henry VII. was much disturbed by insurrections, in consequence of his imperfect title. A baker's boy, named Lambert Symnel, and a Jew's son, named Perkin Warbeck, were successively set up by the York party—the one as a son of the late Duke of Clarence, and the other as the younger brother of Edward V., but were both defeated. Warbeck was hanged at Tyburn in 1499; and nearly about the same time, Henry procured, by forms of law, the death of the Earl of Warwick, the real son of the late Duke of Clarence, a poor idiot boy, whom he had kept fifteen years in confinement, and whose title to the throne, being superior to his own, rendered him uneasy.

Henry, though a cruel prince, as were most of the sovereigns of his age, was a sagacious and peaceful ruler. He paid great attention to all his affairs, and in some of his acts looked far beyond the present time. For example, by marrying his daughter Margaret to James IV. of Scotland, he provided for the possibility of the future union of the two crowns. By a law allowing men of property to break entails, he ensured the reduction of the great lords, and the increase of the number of small proprietors. His constant policy was to depress the chief nobles, and to elevate the clergy, lawyers, and men of new families, as most likely to be dependent on him. The greatest fault of his character was his excessive love of money, of which he amassed an immense sum. During his reign, Ireland was made more dependent on the English crown by a statute prohibiting any parliament from being held in it until the king should give his consent.

HENRY VIII.

Henry VII. died in April 1509, in the fifty-third year of his age. His eldest surviving son and successor, HENRY VIII., was now in his eighteenth year. Young, handsome, and supposed to be amiable, he enjoyed at first a high degree of popularity. Some years before, he had been affianced to Catherine, a Spanish princess, who had previously been the wife of his deceased brother Arthur: he was now married to this lady, the Pope having previously granted a dispensation for that purpose. For many years the reign of Henry was unmarked by any unusual incidents. The chief administration of affairs was committed to a low-born but proud churchman, the celebrated Cardinal Wolsey. The king became much engaged in continental politics; and during a war which he carried on against France, his brother-in-law James IV., who sided with that state, made an unfortunate irruption into the north of England, and was overthrown and slain, with the greater part of his nobility (September 9, 1513), at Flodden.

About this time some changes of great importance to European society took place. Almost ever since the destruction of the Roman Empire, the nations which arose out of it had remained in subjection to the Papal See, which might be said to have inherited the universal sway of that government, but altered from an authority over the bodies of men to an empire over their minds. In the opinion of many, this authority of the Roman Catholic religion had in the course of time become much abused, while the religion itself was corrupted by many superstitious observances. So long as men had continued to be the thoughtless warriors and unlettered peasants which they had been in the middle ages, it is not probable that they would ever have called in question either the authority of the Pope or the purity of the Catholic faith. But, with knowledge, and the rise of a commercial and manufacturing class, came a disposition to inquire into the authority of this great religious empire. The art of printing, discovered about the middle of the preceding century, and which was now rendering literature accessible to most classes of the community, tended greatly to bring about this revolution in European intellect. The minds of men, indeed, seem at this time as if awaking from a long sleep; and it might well have been a question with

persons who had reflection, but no experience, whether the change was to turn to evil or to good.

When men's minds are in a state of preparation for any great change, a very small matter is required to set them in motion. At Wirtemberg, in Germany, there was an Augustine monk, named Martin Luther, who became incensed at the Roman see, in consequence of some injury which he conceived to have been done to his order by the Pope having granted the privilege of selling indulgences to the Dominican order of friars. Being a man of a bold and inquiring mind, he did not rest satisfied till he had convinced himself, and many others around him, that the indulgences were sinful, and that the Pope had no right to grant them. This happened about the year 1517. Controversy and persecution gradually extended the views of Luther, till he at length openly disavowed the authority of the Pope, and condemned some of the most important peculiarities of the Catholic system of worship. In these proceedings, Luther was countenanced by some of the states in Germany, and his doctrines were speedily established in the northern countries of Europe.

THE REFORMATION.

Henry VIII., as the second son of his father, had been originally educated for the church, and still retained a taste for theological learning. He now distinguished himself by writing a book against the Lutheran doctrines; and the Pope was so much pleased with it as to grant him the title of *Defender of the Faith*. Henry was not destined, however, to continue long an adherent of the Roman pontiff. In the year 1527, he became enamoured of a young gentlewoman named Anne Boleyn, who was one of his wife's attendants. He immediately conceived the design of annulling his marriage with Catherine, and marrying this younger and more agreeable person. Finding a pretext for such an act in the previous marriage of Catherine to his brother, he attempted to obtain from the Pope a decree, declaring his own marriage unlawful, and that the dispensation upon which it had proceeded was beyond the powers of the former Pope to grant. The pontiff (Clement VII.) was much perplexed by this request of King Henry, because he could not accede to it without offending Charles V., Emperor of Germany, one of his best supporters, and the brother of Queen Catherine, and at the same time humbling the professed powers of the Papacy, which were now trembling under the attacks of Luther.

Henry desired to employ the influence of his minister, Cardinal Wolsey, who had now reached a degree of opulence and pride never before attained by a subject of England. But Wolsey, with all his greatness, could not venture to urge a matter disagreeable to the Pope, who was more his master than King Henry. The process went on for several years, and still his passion for Anne Boleyn continued unabated. Wolsey at length fell under the king's displeasure for refusing to serve him in this object, was stripped of all his places of power and wealth, and in November 1530, expired at Leicester Abbey, declaring that, if he had served his God as diligently as his king, he would not thus have been given over in his gray hairs. The uncontrollable desire of the king to possess Anne Boleyn, was destined to be the immediate cause of one of the most important changes that ever took place in England—no less than a total reformation of the national religion. In order to annul his marriage with Catherine, and enable him to marry Anne Boleyn, he found it necessary to shake off the authority of the Pope, and procure himself to be acknowledged in Parliament as the supreme head of the English church. His marriage with Anne took place in 1533, and in the same year was born his celebrated daughter Elizabeth.

In 1536, Henry became as anxious to put away Queen Anne as he had ever been to rid himself of Queen Catherine. He had contracted a passion for Jane Seymour, a young lady then of the queen's bed-chamber, as Anne herself had been in that of Catherine.

In order to gratify this new passion, he accused Anne of what appears to have been an imaginary frailty, and within a month from the time when she had been an honoured queen, she was beheaded (May 19) in the Tower. On the very next day he married Jane Seymour, who soon after died in giving birth to a son (afterwards Edward VI.). His daughters, Mary and Elizabeth, were declared illegitimate by act of Parliament, and therefore excluded from the succession.

Hitherto, though professing independence of Rome, Henry still maintained, and even enforced, by severe and bloody laws, the most of its doctrines. He now took measures for altering this system of worship to something nearer the Lutheran model, and also for suppressing the numerous monasteries throughout the country. Being possessed of more despotic power, and, what is stranger still, of more popularity, than any former sovereign of England, he was able to encounter the dreadful risk of offending by these means a vastly powerful corporation, which seems, moreover, to have been regarded with much sincere affection and respect in many parts of England. No fewer than 645 monasteries, 2874 chantries and chapels, 90 colleges, and 110 hospitals, enjoying altogether a revenue of £161,000, were broken up by this powerful and unscrupulous monarch. He partly seized the revenues for his own use, and partly gave them away to the persons who most actively assisted him, and who seemed most able to protect his government from the effects of such a sweeping reform. By this act, which took place in 1537, the Reformation was completed in England. Yet for many years Henry vacillated so much in his opinions, and enforced these with such severe enactments, that many persons of both religions were burnt as heretics. It was in the southern and eastern parts of England, where the commercial classes at this time chiefly resided, that the doctrines of the Reformation were most prevalent. In the western and northern parts of the country, Catholicism continued to flourish; and in Ireland, which was remotest of all from the continent, the Protestant faith made little or no impression.

After the death of Jane Seymour, Henry married Anne of Cleves, a German princess, with whose person, however, he was not pleased; and he therefore divorced her by an act of Parliament. He next married Catherine Howard, niece to the Duke of Norfolk; but had not been long united to her when he discovered that she had committed a serious indiscretion before marriage. This was considered a sufficient reason for beheading the unfortunate queen, and attainting all her relations. Though Henry had thus murdered two wives, and divorced other two, and become, moreover, a monster in form as well as in his passions and mind, he succeeded in obtaining for his sixth wife (1543) Catherine Parr, widow of Lord Latimer, who, it is certain, only contrived to escape destruction by her extraordinary prudence. Almost all who ever served Henry VIII. as ministers, either to his authority or to his pleasures, were destroyed by him. Wolsey was either driven to suicide, or died of a broken heart; Thomas Cromwell, who succeeded that minister, and chiefly aided the king in bringing about the Reformation—Sir Thomas More, lord chancellor, the most virtuous, most able, and most consistent man of his time—the Earl of Surrey, who was one of the most accomplished knights of the age, and the first poet who wrote the English language with perfect taste—all suffered the same fate with Anne Boleyn and Catherine Howard.

When James IV. died at Flodden, in 1513, the Scottish crown fell to his infant son JAMES V., who struggled through a turbulent minority, and was now a gay, and, upon the whole, an amiable prince. His uncle, Henry VIII., endeavoured to bring him into his views respecting religion; but James, who was much in the power of the Catholic clergy, appears to have wished to become the head of the Popish party in England, in the hope of succeeding, by their means, to the throne of that country. A war latterly broke out between the two monarchs, and the Scottish army having refused

to fight, from a dislike to the expedition, James died (December 1542) of a broken heart, leaving an only child, MARY, who was not above a week old. Henry immediately conceived the idea of marrying his son Edward to this infant queen, by which he calculated that two hostile nations should be united under one sovereignty, and the Protestant church in England be supported by a similar establishment in Scotland. This project, however, was resisted by the Scots, of whom very few as yet were inclined to the Protestant doctrines. Henry, enraged at their hesitation, sent a fleet and army, in 1544, to inflict vengeance upon them. The Scots endured with great patience the burning of their capital city, and many other devastations, but still refused the match. The government of Scotland was now chiefly in the hands of Cardinal Beaton, a man of bold and decisive intellect, who zealously applied himself to suppress the reforming preachers, and regarded the English match as likely to bring about the destruction of the Catholic religion.

#### EDWARD VI.—QUEEN MARY.

Henry died, January 28, 1547, leaving the throne to his only son, a boy of ten years of age, who was immediately proclaimed king under the title of EDWARD VI. The Duke of Somerset, maternal uncle to the young king, became supreme ruler under the title of Protector, and continued to maintain the Protestant doctrines. Under this reign, the church of England assumed its present form, and the Book of Common Prayer was composed nearly as it now exists. Somerset being resolved to effect, if possible, the match between Edward VI. and Mary of Scotland, invaded that country in the autumn of 1547, and was met at Musselburgh by a large army under the governor, the Earl of Arran. Though the Scotch were animated by bitter animosity against the English, against their religion, and against the object of their expedition, they did not fight with their usual resolution, but were defeated, and pursued with great slaughter. Finding them still obstinate in refusing to give up their queen, Somerset laid waste a great part of the country, and then retired. Previous to this period, Cardinal Beaton had been assassinated by private enemies; but the Scotch were encouraged to persevere by the court of France, to which they now sent the young queen for protection.

In the reign of Edward VI. the government was conducted mildly, until the Protector Somerset was degraded from his authority by the rising influence of Dudley, Duke of Northumberland, who caused him soon after to be tried and executed. Northumberland, who was secretly a Roman Catholic, was not so mild or popular a ruler. Yet, throughout the whole reign of Edward VI., which was terminated by his death on the 6th of July 1553, at the early age of sixteen, no religious party was persecuted, except those who denied the fundamental doctrines of the Christian religion. It would have been well for the honour of a church which has produced many great men, and to which the modern world is indebted for the very existence of Christianity, if it had not been tempted after this period to commence a very different course of action. The crown now belonged by birthright to MARY, the eldest daughter of Henry VIII., who was a zealous Catholic. Northumberland, however, assuming the illegitimacy of that princess and her sister Elizabeth, set up as queen the Lady Jane Grey, who was descended from a younger sister of King Henry, and who had been married to a son of the Duke of Northumberland. Lady Jane was the most beautiful, most intelligent, and most amiable of all the females who appear in the history of England. Though only seventeen, she was deeply learned, and yet preserved all the unaffected graces of character proper to her interesting age. Unfortunately, her father-in-law Northumberland was so much disliked, that the Catholics were enabled to displace her from the throne in eight days, and to set up in her stead the Princess Mary. Northumberland, Lady Jane, and her husband, Guildford, Lord Dudley, were all beheaded by that

savage princess, who soon after took steps for restoring the Catholic religion, and married Philip II., king of Spain, in order to strengthen herself against the Protestant interest. Mary experienced some resistance from her Protestant subjects, and being under great suspicion of her sister Elizabeth, who professed the reformed faith, but took no part against her, was almost on the point of ordering her to execution also. As soon as she had replaced the Catholic system, and found herself in possession of sufficient power, she began that career of persecution which has rendered her name so infamous. Five out of fourteen Protestant bishops, including the revered names of Cranmer, Latimer, and Ridley, were committed to the flames as heretics; and during the ensuing part of her reign, which was closed by her death, November 17, 1558, nearly three hundred persons suffered in the same manner. These scenes did not take place without exciting horror in the minds of Englishmen in general, including even many Catholics; but the royal authority was at all times too great under this line of princes to allow of effectual resistance. Such a persecution, however, naturally fixed in the minds of the British Protestants a hereditary horror for the name of Catholic, which has in its turn been productive of many retaliatory persecutions, almost equally to be lamented. In the latter part of her reign, she was drawn by her husband into a war with France, of which the only effect was the loss of Calais, the last of the French possessions of the sovereigns of England. The natural sourness of Mary's temper was increased by this disgraceful event, as well as by her want of children, and she died in a state of great unhappiness.

#### ELIZABETH—MARY, QUEEN OF SCOTS—REFORMATION IN SCOTLAND.

A more auspicious scene opened for England in the accession of ELIZABETH, a princess of great native vigour of mind, and who had been much improved by adversity, having been kept in prison during the whole reign of her sister. From the peculiar circumstances of Elizabeth's birth, her right of succession was denied by all the Catholics at home and abroad. This party considered Mary, Queen of Scots, who was descended from the eldest sister of Henry VIII., and had been brought up in the Catholic faith at the court of France, as their legitimate sovereign. Elizabeth had no support in any quarter, except among her Protestant subjects. The Pope issued a bull, which, directly or indirectly, pronounced her a usurper, and gave permission to her subjects to remove her from the throne. The court of France professed to consider the Queen of Scots, who had recently been married to the Dauphin, as the Queen of England. Under these circumstances, Elizabeth found no chance of safety except in restoring and maintaining the Protestant religion in her own country, and in seeking to support it in all others where the people were favourable to it. The Scottish nation being now engaged in a struggle with their regent, Mary of Guise, in behalf of Protestantism, Elizabeth gladly acceded to a proposal made by the nobles of that country, and sent a party of troops, by whose assistance the reformed religion was established (1560). In bringing about this change, the chief native leaders were James Stewart, a natural son of King James V., and John Knox, who had once been a friar, but was now a Protestant preacher. As a natural consequence of the obligation which the English queen had conferred upon the Scottish reformers, she acquired an influence over the country which was never altogether lost.

About the time when the Scottish Parliament was establishing the reformed religion, Mary of Guise breathed her last, leaving the country to be managed by the reforming nobles. Her daughter, the Queen of Scots, now eighteen years of age, and the most beautiful woman of her time, had in 1559 become the queen-consort of France; but in consequence of the death of her husband, she was next year left without any political interest in that country. She accordingly, in August 1561, returned to Scotland, and assumed the

sovereignty of a country which was chiefly under the rule of fierce nobles, and where the people, from the difference of their religious faiths, as well as their native barbarism, were little fitted to yield her the obedience of loyal and loving subjects.

The change of religion in Scotland was of a more decisive kind than it had been in England. The English Reformation had been effected by sovereigns who, while they wished to throw off the supremacy of the Pope, and some of the Catholic rites, desired to give as little way as possible to popular principles. They therefore not only seized the supremacy of the church to themselves, but, by bishops and other dignitaries, made it an efficient instrument for supporting monarchical government. In Scotland, where the Reformation was effected by the nobles and the people, at a time when still bolder principles had sprung up, none of this machinery of power was retained. The clergy were placed on a footing of perfect equality; they were all of them engaged in parochial duties, and only a small part of the ancient ecclesiastical revenues was allowed to them. In imitation of the system established at Geneva, their general affairs, instead of being intrusted to the hands of bishops, were confided to courts formed by themselves. These courts, being partly formed by lay elders, kept up a sympathy and attachment among the community, which has never existed in so great a degree in the English church. What was of perhaps still greater importance, while a large part of the ancient revenues was absorbed by the nobles, a very considerable portion was devoted to the maintenance of pariah schools, under the express control of the clergy. These at once formed regular nurseries of Protestant Christians, and disseminated the elements of learning more extensively over this small and remote country than it had ever been over any other part of the world.

Queen Mary, having little power in her own country, was obliged to govern by means of her natural brother, James Stewart, whom she created Earl of Moray, and who was the leader of the Protestant interest in Scotland. Personally, however, she was intimately connected with the great Catholic powers of the continent, and became a party, in 1564, to a coalition formed by them for the suppression of Protestantism all over Europe. She had never yet resigned her pretensions to the English throne, but lived in the hope that, when the Catholics succeeded in everywhere subduing the Protestants, she would attain that object. Elizabeth, who had only the support of the Protestant part of her own subjects, with a friendly feeling among the Scotch and other unimportant Protestant nations, had great reason to dread the confederacy formed against her. She nevertheless stood firm upon the Protestant faith, and the principles of a comparatively liberal and popular government, as the only safe position.

A series of unfortunate events threw Mary into the hands of Elizabeth. The former queen, in 1565, married her cousin Lord Darnley, and by that means alienated the affections of her brother and chief minister, the Earl of Moray, as well as of other Protestant lords, who raised a rebellion against her, and were obliged to fly into England. Soon after, the jealousy of Darnley respecting an Italian musician named Rizzio, who acted as French secretary to the queen, united him in a conspiracy with the banished Protestant noblemen for the murder of that humble foreigner, which was effected under very barbarous circumstances, March 9, 1566. Mary, who was delivered in the succeeding June, of her son James, withdrew her affections entirely from her husband, and began to confide chiefly in the Earl of Bothwell, who some months afterwards caused Darnley to be blown up by gunpowder, while he lay in a state of sickness; in which transaction it has always been suspected, but never proved, that the queen had a considerable share. Bothwell soon after forced her, in appearance, into a marriage, which excited so much indignation among her subjects, that the same Protestant lords who had effected the Reformation, and were the friends of Elizabeth, easily obtained the possession

of her person, and having deposed her, crowned her infant son as king, under the title of JAMES VI., while the regency was vested in the Earl of Moray. In May 1568, Mary escaped from her prison in Lochleven, and put herself at the head of a body of her partisans, but was defeated by the regent at the battle of Langside, and was then compelled to seek refuge in England. By placing her rival under strict confinement, and extending an effectual protection to the regents Moray, Lennox, Mar, and Morton, who successively governed Scotland, Elizabeth fortified herself in a great degree against the Catholic confederacy.

#### GOVERNMENT OF ELIZABETH.

It has already been seen that the liberties of the people were much favoured by the frequent interruptions in the succession to the crown. Whenever one branch of the Plantagenet family displaced another, the new king, feeling himself weak, endeavoured to strengthen his title by procuring a parliamentary enactment in support of it. It thus became established as a regular principle in the English government, that the people who were represented in parliament had something to say in the appointment of their king. A considerable change, however, had taken place since the accession of Henry VII. The great power acquired by that king, through his worldly wisdom and the destruction of the nobility during the civil wars, had been handed down through four successive princes, who inherited the crown by birthright, and did not require to cringe to the people for a confirmation of their title. The parliaments, therefore, were now a great deal more under the control of the sovereign than they had formerly been. From an early period of his reign, Henry VIII. never permitted his parliament to oppose his will in the least. To the various changes of religion under successive sovereigns, the parliaments presented no obstacle. An idea was now beginning to arise, very much through the supremacy which the sovereigns had acquired over the church, that the right of the crown was one derived from God, and that the people had nothing to do with it, except to obey what it dictated to them. Of this notion, no one took so much advantage, or was at so much pains to impress it, as Elizabeth. No doubt her arbitrary measures were generally of a popular nature, yet this does not excuse them in principle; and their ultimate mischief is seen in the attempts of future sovereigns to pursue worse ends upon the same means. Elizabeth's government consisted entirely of herself and her ministers, who were, from the beginning to the end of her reign, the very spirit and essence of the enlightened men of England. Her prime minister was the celebrated Lord Burleigh, by far the most sagacious man who ever acted as a minister in Britain; and all her emissaries to foreign courts were of one complexion—circumspect and penetrating men, ardently devoted to their country, their mistress, and to the Protestant religion.

On the accession of Elizabeth, the two celebrated acts of Supremacy and Conformity were passed, for the purpose of crushing the political influence of the Popish religion; an end which they sufficiently accomplished. By the act of supremacy, all benefited clergymen, and all holding offices under the crown, were compelled to take an oath abjuring the temporal and spiritual jurisdiction of any foreign prince or prelate, on pain of forfeiting their offices, while any one maintaining such supremacy was liable to heavy penalties. The other statute prohibited any one from following any clergyman who was not of the established religion, under pain of forfeiting his goods and chattels for the first offence, of a year's imprisonment for the second, and of imprisonment during life for the third; while it imposed a fine of a shilling on any one absenting himself from the established church on Sundays and holidays. By means of a court of ecclesiastical commission, which the queen erected, these laws, and others of a more trifling and vexatious nature, were enforced with great severity. It may afford some idea of the barbarity of the age, and

of the terror in which the church of Rome was now held, that, during the reign of Elizabeth, one hundred and eighty persons suffered death by the laws affecting Catholic priests and converts.

WAR IN THE NETHERLANDS.

For more than a century after the Reformation, religion was the real or apparent motive of the most remarkable transactions in European history. It is scarcely necessary to point out that this sentiment, though in general the purest by which human beings can be actuated, is, like all the other higher sentiments of our nature, when offended or shocked, capable of rousing the inferior sentiments into great activity. In the sixteenth and seventeenth centuries, European society was comparatively unenlightened and barbarous; we therefore find that variances of opinion respecting religion were then productive of far fiercer feelings than they are in our own more humane age. The Protestant heresy, as it was termed by the Catholics, was also a novelty, the remote effects of which no man could foretell; it was mingled with political questions, and by some princes was supposed to forebode a general revolt against monarchical authority. We are not therefore to wonder that great cruelties were committed, either by the Catholics in seeking to support the church of Rome, or by the Protestants in endeavouring to insure themselves against a renewal of severities inflicted by the opposite party. Nor is it necessary, in the present age, that the adherents of either faith should retain any feeling of displeasure against the other, on account of barbarities which took their rise in the ignorance and rudeness of a former period, and of which the enlightened of both parties have long since disapproved.

In the Netherlands, which formed part of the dominions of Philip II. of Spain, the reformed faith had made considerable advances. Philip, like other Catholic princes, entertained the idea that this new creed, besides being condemnable as a heresy and an offence against the Deity, tended to make men independent of their rulers. Finding the people obstinate in their professions, he commenced a war with the Netherlands, for the purpose of enforcing his authority over their consciences. This war lasted about twenty years; for the Netherlands, though a nation of no great strength, fought like desperate men, and endured the most dreadful hardships rather than submit. The chief leader in this war of liberty was William, Prince of Orange, one of the purest and most courageous patriots that ever breathed. Elizabeth could not help wishing well to the Netherlands, though for a long time her dread of Spain, then one of the greatest powers in Europe, prevented her from openly assisting them. At the same time, about two millions of the people of France were Protestants, or, as they were then called, Huguenots, who acted also for the general Protestant cause with as much energy as the great strength of the French government would permit. Elizabeth at length, in 1578, extended an open protection to the Netherlands, excusing herself to Philip by stating her fear that they would otherwise throw themselves into the arms of France. The northern provinces were thus enabled to assert their independence, and to constitute the country which has since been called Holland.

DEATH OF MARY, QUEEN OF SCOTS.

The Catholic powers of the continent formed many schemes for annoying or dethroning Elizabeth; and the imprisoned Scottish queen, or her adherents, were generally concerned in them. The king of Spain, determined at length to make a decisive effort, commenced the preparation of a vast fleet, which he termed the Invincible Armada, and with which he designed to invade the English shores. Elizabeth, her ministers, and people, beheld the preparations with much concern, and their fears were increased by the plots which were incessantly forming amongst her Catholic subjects in

behalf of the Queen of Scots. An act was passed declaring that any person, by or for whom any plot should be made against the Queen of England, should be guilty of treason. When, soon after, a gentleman named Babington formed a conspiracy for assassinating Elizabeth and placing Mary on the throne, the latter queen became of course liable to the punishment for treason, although herself innocent. She was subjected to a formal trial in her prison of Fotheringay Castle, and found guilty. Elizabeth hesitated for some time to strike an unoffending and unfortunate person, related to her by blood, and her equal in rank. But at length fears for herself got the better of her sense of justice, and, it may be added, of her good sense, and she gave her sanction to an act which leaves an ineffaceable stain upon her memory. On the 7th of February 1587, Mary, Queen of Scots, was beheaded in the hall of the castle, after an embittered confinement of more than eighteen years.

James VI. was now, after a turbulent minority, in possession of the reins of government in Scotland, but with little real power, being a dependant and pensioner of Elizabeth, and at the same time much controlled by the clergy, who asserted a total independence of all temporal authority, and considered themselves as the subjects alone of the Divine founder of the Christian faith. James made many attempts to assert a control over the church like that enjoyed by the English monarch, and also to introduce an Episcopal hierarchy, but never could attain more than a mere shadow of his object. The chief influence he possessed arose in fact from his being regarded as heir presumptive to the English crown.

SPANISH ARMADA—REBELLIONS IN IRELAND.

In 1588, the Spanish Armada, consisting of 130 great vessels, with 20,000 land forces on board, set sail against England, while 34,000 more land forces prepared to join from the Netherlands. Amidst the consternation which prevailed in England, active measures were taken to defend the country; thirty vessels prepared to meet the Armada, and another fleet endeavoured to block up the Netherlands forces in port. The command was taken by Lord Howard of Effingham. Troops were also mustered on land to repel the invaders. The English fleet attacked the Armada in the Channel, and was found to have a considerable advantage in the lightness and manageableness of the vessels. As the Armada sailed along, it was infested by the English in the rear, and by a series of desultory attacks, so damaged as to be obliged to take refuge on the coast of Zealand. The Duke of Parma now declined to embark the Netherlands forces, and it was resolved by the admiral, that they should return to Spain by sailing round the Orkneys, as the winds were contrary to their passage directly back. Accordingly they proceeded northward, and were followed by the English fleet as far as Flamborough Head, where they were terribly shattered by a storm. Seventeen of the ships, having 5000 men on board, were cast away on the Western Isles and the coast of Ireland. Of the whole Armada, fifty-three ships only returned to Spain, and these in a wretched condition. The seamen, as well as the soldiers who remained, were so overcome with hardships and fatigue, and so dispirited by their discomfiture, that they filled all Spain with accounts of the desperate valour of the English, and of the tempestuous violence of that ocean by which they were surrounded.

Though the Protestant church had meanwhile been established in Ireland, the great bulk of the people continued to be Roman Catholics. The native rudeness of the people and their chiefs, and the discontent occasioned by what was considered as a foreign church establishment, rendered the country turbulent and difficult to govern. Sir John Perrot, the deputy, proposed to improve the country by public works and English laws; but it was thought injurious to England to improve the condition of Ireland. A series of rebellions under chiefs named O'Neill was the consequence, and the English

government was maintained with great difficulty, and at an enormous expense. The rebellion of Hugh O'Neill, Earl of Tyrone, was particularly formidable. The English officers were at first unsuccessful, and met with some serious defeats. In 1599, Tyrone gained so great a victory, that the whole province of Munster declared for him. He then invited the Spaniards to make a descent on Ireland, and join him. The queen sent over her favourite, the Earl of Essex, with 20,000 men; but he did not proceed with vigour, and soon after found it necessary to return to England to justify himself. Next year Tyrone broke the truce he had formed with Essex, overran the whole country, and acted as sovereign of Ireland. If Spain had at this time given him the support he asked, Ireland might have been discovered from the English crown.

Elizabeth now selected as her deputy for Ireland, Blount, Lord Mountjoy, who was in every respect better fitted than Essex to conduct such a warfare. As a preliminary step, this sagacious officer introduced jealousy and disunion among the Irish chiefs. The very celerity of his movements tended to dispirit the insurgents. In 1601, six thousand Spaniards landed in Kinsale harbour, for the purpose of supporting the Irish. Mountjoy immediately invested the place, and prevented them from acting. Tyrone marched from the south of Ireland to their relief, and was met and overthrown by a much inferior English force, after which Kinsale was surrendered. About the time when Elizabeth died (1603), Tyrone submitted, and Ireland was once more reduced under the authority of the English crown.

#### CONCLUSION OF THE REIGN OF ELIZABETH.

It is remarkable, that while Elizabeth increased in power and resources, she became more noted for feminine weaknesses. In her early years she had shown a stoicism, and superiority to natural affections, not usually observed in women. But in her old age, she became both volatile and susceptible to an extraordinary degree; so that the hand which she had withheld in her younger days from the noblest princes of Europe, seemed likely to be bestowed in her old age upon some mere court minion. Her favourite in middle life was Robert, Earl of Leicester, a profligate and a trifier. In her latter days she listened to the addresses of the Earl of Essex, a young man of greater courage and better principle, but also headstrong and weak. Essex, who had acquired popularity by several brilliant military enterprises, began at length to assume an insolent superiority over the queen, who was on one occasion so much provoked by his rudeness as to give him a hearty box on the ear. Notwithstanding all his caprices, presumption, and insults, the queen still dotingly forgave him, until he at length attempted to raise an insurrection against her in the streets of London, when he was seized, condemned, and after much hesitation, executed (February 25, 1601).

Elizabeth, in at last ordering the execution of Essex, had acted upon her usual principle of sacrificing her feelings to what was necessary for the public cause; but in this effort, made in the sixty-eighth year of her age, she had miscalculated the real strength of her nature. She was observed from that time to decline gradually in health and spirits.

About the close of 1601, she fell into a deep hypochondria or melancholy. She could scarcely be induced to have herself dressed, and at length became so much absorbed by her sorrow as to refuse sustenance, and sat for days and nights on the floor, supported by a few cushions, brought to her by her attendants. On the 24th of March 1603, she expired, after a reign of nearly forty-five years, during which England advanced—politically and commercially—from the condition of a second-rate to that of a first-rate power, and the Protestant religion was established on a basis from which it could never afterwards be shaken.

The reign of Elizabeth saw the commencement of the naval glory of England. Down to the reign of

Henry VII., there was no such thing as a navy belonging to the public, and the military genius of the people was devoted exclusively to enterprises by land. The rise, however, of a commercial spirit in Europe, which in 1492 had caused the discovery of America, and was again acted upon by the scope for adventure which that discovery opened up, had latterly caused great attention to be paid to nautical affairs in England. Englishmen of all ranks supported and entered into enterprises for discovering unknown territories; and under Drake, Cavendish, Raleigh, and Frobisher, various expeditions of less or more magnitude were sent out. The colonies of North America were now commenced. Amongst the exertions of private merchants, our attention is chiefly attracted by the commencement of the northern whale-fishery, the cod-fishery of Newfoundland, and the less laudable slave-trade in Africa. When hostilities with Spain became more open, the English commanders made many successful attacks upon her colonies in the West Indies, and also upon the fleets of merchant vessels which were employed to carry home the gold, and other almost equally valuable products of the New World, to the Spanish harbours. These attacks were now made in a more systematic manner, and with more effect, as a revenge for the affair of the Armada. It may be said that the dominion of Britain over the seas was perfected almost in a single reign; a power which has been of such advantage to the country, both in protecting its commerce, and keeping it secure from foreign invasion, that its origin would have conferred everlasting lustre on this period of British history, even although it had not been characterised by any other glorious event.

The chief articles exported from England to the continent were wool, cloth, lead, and tin: formerly these had been sent in vessels belonging to the Hanse Towns—certain ports of the north of Europe, possessing great privileges—but now English vessels were substituted for this trade. Birmingham and Sheffield were already thriving seats of the hardware manufacture, and Manchester was becoming distinguished for making cottons, rugs, and friezes. Stocking-weaving and the making of sailcloth, serge, and baize, took their rise in this reign. The progress of other arts was much favoured by the bloody persecutions in the Netherlands, which drove into England great numbers of weavers, dyers, cloth-dressers, and silk-throwers. Amongst the wealthier classes, the wearing of handsome apparel and of gold ornaments and jewellery, made a great advance. Coaches were introduced, but for a time thought only fit for the use of ladies. Great improvements were made in the building of houses. Theatrical amusements were begun, and attained great vogue, though only in London. The smoking of tobacco was introduced by Sir Walter Raleigh, who became acquainted with the plant in Virginia. At the end of Elizabeth's reign, the population of London was about 160,000, or a tenth of what it now is; and the whole kingdom probably contained about 5,000,000 of inhabitants.

#### THE STUARTS—JAMES I.

The successor of Elizabeth, by birthright, was JAMES VI. OF SCOTLAND (styled JAMES I. OF ENGLAND), who was now arrived at the prime of life, and had been married for some years to the Princess Anne of Denmark, by whom he had two sons, Henry and Charles, and one daughter named Elizabeth. James immediately removed to London, and assumed the government of England, while his native kingdom, though thus united under the same sovereignty, still retained its own peculiar institutions. At the suggestion of the king, who wished to obliterate the distinction of the two countries, the common name of *Great Britain* was now conferred upon them. King James was an oddity in human character. His person was naturally feeble, particularly in the limbs, which were scarcely sufficient to support his weight. He had great capacity for learning, some acuteness, and a considerable share of wit; but was pedantic, vain, and weak. He believed kings to be the

deputies of God, and accountable to God alone for their actions. He was equally disposed with Elizabeth to govern despotically, or according to his own will; but he wanted the vigour and the tact for securing popularity which enabled his predecessor to become so much the mistress of her subjects.

Notwithstanding the energy of Elizabeth, the popular spirit had gradually been acquiring force in her reign. It was chiefly seen in the acts of the Puritans, a religious party, who wished to make great reforms in the church, both in its government and its worship, and who, from the fervour of their devotions and the strictness of their manners, might be likened to the Presbyterians of Scotland. King James found considerable difficulty at the very first in controlling this party and evading their demands. He was no less troubled, on the other hand, by the Catholics, who, recollecting his mother Mary, conceived that he would be inclined to make matters more easy to them in England. Upon the whole, there were such difficulties in the way, as, to have steered successfully through them, would have required a wiser instead of a weaker ruler than Elizabeth.

#### GUNPOWDER PLOT.

The disappointment of the Catholics on finding that the severe laws against them were not to be relaxed, led to a conspiracy on the part of a few gentlemen of that persuasion, of whom the chief was William Catesby, a person of dissolute habits. It was arranged that, on the day of the meeting of Parliament, November 5, 1605, the House of Lords should be blown up by gunpowder, at the moment when the King, Lords, and Commons, were all assembled in it, thus destroying, as they thought, all their chief enemies at one blow, and making way for a new government which should be more favourable to them. Accordingly, thirty-four barrels of powder were deposited in the cellars beneath the House, and a person named Guy Fawkes was prepared to kindle it at the proper time. The plot was discovered, in consequence of the receipt of a letter by Lord Monteagle, warning him not to attend the meeting of Parliament. An investigation took place during the night between the 4th and 5th of November, when the gunpowder was discovered, and Fawkes taken into custody. He confessed his intentions; and the rest of the conspirators fled to the country, where most of them were cut to pieces in endeavouring to defend themselves. Notwithstanding the atrocious character of this plot, the king could never be induced to take advantage of it, as most of his subjects desired, for the purpose of increasing the persecution of the Catholic party: he probably feared that new severities might only give rise to other attempts against his life.

#### PLANTATIONS IN IRELAND.

The state in which the king found Ireland at his accession, afforded an opportunity for commencing a more generous policy in reference to that country, and introducing regulations favourable to internal improvement. Previously to this reign, the legislative authority of the English government was confined to the small district called the 'Pale,' while the rest was governed by native sovereigns or chiefs, whose connection with the king of England was merely that of feudal homage, which did not prevent them from making wars or alliances with each other. Subject to deprivations from these powerful barons, the native Irish, from a very early period, petitioned for the benefit of the English laws; but the Irish Parliament, which was composed of the English barons, was never at a loss for the means of preventing this desirable measure from being effected. James was in reality the first king who extended the English law over the whole of Ireland, by making judicial appointments suited to the extent of the country. This he was enabled to do, by the recent wars having put the country more completely in his power than it had been in that of any former monarch. He began by extending favour to the Irish chiefs, not excepting

Tyrone. He passed an act of oblivion and indemnity by which all persons who had committed offences, coming to the judges of assize within a certain day, might claim a full pardon. At the same time, toleration was virtually refused to the Catholic persuasion, and much discontent therefore still existed. Some of the chieftains, having conspired against the crown, were attainted, and their lands were given to English settlers, with a view to improving the population of the country by an infusion of civilised persons. But this experiment, though well-meant, was managed in a partial spirit, and gave rise to much injustice. In 1613, the first Irish Parliament was held in which there were any representatives of places beyond the Pale.

#### THE KING'S CHILDREN—THE SPANISH MATCH.

In 1612, the king had the misfortune to lose his eldest son, Henry, a youth of nineteen, who was considered as one of the most promising and accomplished men of the age. The second son, Charles, then became the heir-apparent, and James was busied for several years in seeking him out a suitable consort. The Princess Mary of Spain was selected, a match which could not be popular, considering that the young lady was a Catholic, and of a family who had long been the enemies of England. The prince, attended by the Duke of Buckingham, made a romantic journey in disguise to Madrid to push the match; but a quarrel between the British and Spanish ministers led to its being broken off, and to a bloody war between the two nations.

Elizabeth, the only remaining child of the king, was married, in 1613, to Frederick, Prince Palatine of the Rhine, who was afterwards so unfortunate as to lose his dominions, in consequence of his placing himself at the head of the Bohemians, in what was considered as a rebellion against his superior, the Emperor of Germany. This discarded pair, by their youngest daughter Sophia, who married the Duke of Brunswick, were the ancestors of the family which now reigns in Britain.

#### FEATURES OF JAMES I.'S GOVERNMENT.

The reign of James I. was not marked by what are called great events. This was greatly owing to his timid character, which induced him to maintain peace, at whatever sacrifice, throughout the greater part of his reign. The prime leaders of his government were youthful favourites, who possessed no merit but personal elegance. Experienced statesmen, brave soldiers, and learned divines, had to bow to these dissolute youths, if they wished to remain, and still more if they hoped to advance, in the royal favour. Even Bacon, the noblest intellect of the age, and who, by the result of his studies, has done more than almost any other man to promote the progress of knowledge, is found to have attached himself to the minion Duke of Buckingham, for the purpose of improving his interest at court.

In despotic countries, the vices of the court often corrupt all classes; but it was otherwise at that period in Britain. The country gentlemen, and the merchants in the incorporated towns, had privileges which the court dared not too often violate, and a feeling of rectitude and independence was encouraged among these classes, which the statesmen of the age too much overlooked. The House of Commons gave frequent resistance to the court, and often compelled James to yield, at the very moment when he was preaching his doctrines of divine right. In his first Parliament, they took into consideration several grievances, such as *purveyance*, a supposed right in the officers of the court to seize what provisions they pleased, at any price, or at no price; another was the right of granting *monopolies*, which had become a source of revenue to the court by cheating the country, certain persons having the monopoly of certain manufactures and articles of domestic consumption, which they were allowed to furnish at their own prices. The Commons likewise remonstrated against pluralities in the church, and against a new set of canons which the king and the church tried to force on the nation without their consent. In 1614, they

threatened to postpone any supply till their grievances were redressed. The king, in his turn, threatened to dissolve them if they did not immediately grant a supply; and they allowed him to take his course, which did not fill his coffers. These, and many other instances of bold resistance, should have given warning to the court. They were the shadows of coming events, and attention to them might have saved the bloodshed and confusion of the succeeding reign.

English literature, which first made a decisive advance in the reign of Elizabeth, continued to be cultivated with great success in the reign of King James. The excellence of the language at this time as a medium for literature, is strikingly shown in the translation of the Bible now executed. It is also shown in the admirable dramatic writings of Shakspeare, and in the valuable philosophic works of Bacon. The inductive philosophy, made known by the last writer—namely, that mode of reasoning which consists in first ascertaining facts, and then inferring conclusions from them—reflects peculiar lustre on this period of our history. Very great praise is also due to Napier of Merchiston, in Scotland, for the invention of *logarithms*, a mode of calculating intricate numbers, essential to the progress of mathematical science.

CHARLES I.—HIS CONTENTIONS WITH THE HOUSE OF COMMONS.

King James died in March 1625, in the fifty-ninth year of his age, and was succeeded by his son CHARLES, now twenty-five years of age. One of the first acts of the young king was to marry the Princess Henrietta Maria, daughter of Henry IV. of France, and a Catholic. This was an unfortunate step for the House of Stuart, for the two eldest sons of the king and queen, though educated as Protestants, were influenced in some measure by the religious creed of their mother, so that they ultimately became Catholics; and this, in the case of the second son, James II., led to the family being expelled from the British throne.

After breaking off the proposed match with the Princess Mary of Spain, Britain eagerly threw itself into a war with that country, which was still continued. To supply the expenses of that contest, and of a still more unnecessary one into which he was driven with France, the king applied to Parliament, but was met there with so many complaints as to his government, and such a keen spirit of popular liberty, that he deemed it necessary to revive a practice followed by other sovereigns, and particularly Elizabeth, of compelling his subjects to grant him gifts, or, as they were called, *benevolences*, and also to furnish ships at their own charge, for carrying on the war. Such expedients, barely tolerated under the happy reign of Elizabeth, could not be endured in this age, when the people and the Parliament were so much more alive to their rights. A general discontent spread over the nation. The Commons, seeing that if the king could support the state by self-raised taxes, he would soon become independent of all control from his Parliaments, resolved to take every measure in their power to check his proceedings. They also assailed him respecting a right which he assumed to imprison his subjects upon his own warrant, and to detain them as long as he pleased. Having made an inquiry into the ancient powers of the crown, before these powers had been vitiated by the tyrannical Tudors, they embodied the result in what was called a PETITION OF RIGHT, which they presented to him as an ordinary bill, or rather as a second Magna Charta, for replacing the privileges of the people, and particularly their exemption from arbitrary taxes and imprisonment, upon a fixed basis. With great difficulty Charles was prevailed upon to give his sanction to this bill (1628); but his disputes with Parliament soon after ran to such a height, that he dissolved it in a fit of indignation, resolving never more to call it together. About the same time his favourite minister, the Duke of Buckingham, was assassinated at Portsmouth, and Charles resolved thenceforward to be in a great measure his own minis-

ter, and to trust chiefly for the support of his government to the English hierarchy, to whose faith he was a devoted adherent, and who were, in turn, the most loyal of his subjects. His chief counsellor was Laud, Archbishop of Canterbury, a man of narrow and bigoted spirit, and who made it his duty rather to increase than to diminish the ceremonies of the English church, although the tendency of the age was decidedly favourable to their diminution. For some years Charles governed the country entirely as an irresponsible despot, levying taxes by his own orders, and imprisoning such persons as were obnoxious to him, in utter defiance of the Petition of Right. The Puritans, or church reformers, suffered most severely under this system of things. They were dragged in great numbers before an arbitrary court called the Star-Chamber, which professed to take cognizance of offences against the king's prerogative, and against religion; and sometimes men venerable for piety, learning, and worth, were scourged through the streets of London, and had their ears cut off, and their noses slit, for merely differing in opinion, on the most speculative of all subjects, with the king and his clergy. The great body of the people beheld these proceedings with horror, and only a fitting occasion was wanted for giving expression and effect to the public feeling.

It is to be observed, that none of the taxes imposed by Charles were in themselves burdensome; the country was then in a most prosperous condition, and the taxes far less in proportion to every man's means than they have ever since been. It was only to the principle of their being raised without Parliamentary sanction, which had formerly been so necessary a control on the royal power, that the people were disposed to resist them. It may easily be supposed, that though there might be a general disposition to resistance, the most of individuals would not like to be the first to come forward for that purpose, as, in such an event, they would have been sure to experience the severest persecution from the court. At length, John Hampden, a gentleman of Buckinghamshire, resolved to undergo any personal inconvenience rather than pay his twenty shillings of ship-money. The case was tried in the Exchequer (1637); and as the judges were then dismissible at the royal pleasure, and of course the humble servants of the king in everything, Hampden lost his cause. He roused, however, more effectually than ever, the attention of the people to this question, and means were not long wanting to check the king in his unfortunate career.

TROUBLES IN SCOTLAND—THE NATIONAL COVENANT.

An attempt had been made by King James to introduce the Episcopal church into Scotland, because it was thought dangerous to the English church that a form of worship resembling that of the Puritans should be permitted to exist in any part of the king's dominions. The same object was prosecuted with greater zeal by King Charles; and although the people were generally adverse to it, he had succeeded, after a visit which he paid to the country in 1633, in settling thirteen bishops over the church, by whom he hoped to govern the clergy as he did those of England. But when he attempted, in 1637, to introduce a new Book of Common Prayer into the Scotch churches, the spirit of the people could no longer be kept within bounds. On the Liturgy being opened in the principal church at Edinburgh, the congregation rose in a violent tumult, and threw their clasped Bibles, and the very stools they sat on, at the minister's head; and it was not till the whole were expelled by force, that the worship was permitted to proceed. It was found necessary, by the Scottish state-officers, to withdraw the obnoxious Liturgy, till they should consult the king, who, not dreading any mischief, gave orders that it should be used as he had formerly directed, and that the civil force should be employed in protecting the clergymen. It was found quite impossible to obey such an order in the face of a united people, who, by committees assembled at Edinburgh, representing the nobles, minis-

ters, gentry, and burghers, endeavoured to awe the king into an abandonment of the late innovations. Charles endeavoured by every means in his power to avoid such a humiliation, which he believed would give immense force to the innovators in England. But the Scotch, when they found him hesitating, bound themselves (March 1638), under a bond called the *National Covenant*, which was signed by nineteen-twentieths of the adult population, to resist their sovereign in every attempt he might make to bring in upon them the errors of Popery—for such they held to be the forms of worship and ecclesiastical government which Charles had lately imposed upon their church. The king sent his favourite Scotch counsellor, the Marquis of Hamilton, to treat with his northern subjects; but nothing would satisfy them but the calling of a General Assembly of the church, for the purpose of settling all disputes. Charles, though he saw that this was only an appeal to the heads of the party by which he had been opposed, consented to the proposal, for the purpose of gaining time, that he might make warlike preparations against his refractory people.

The Assembly met at Glasgow in November, and, as might have been expected, formally purified the church from all the late innovations, excommunicating the bishops, and declaring the government of the clergy to rest, as formerly, in the General Assembly, which consisted of a selection of two clergymen from each presbytery, with a mixture of lay elders, and nothing to control its proceedings but their interpretation of the will of the divine founder of the Christian religion. Early in the succeeding year, the king, with great difficulty, collected an army of 20,000 men, whom he led to the border of Scotland, for the purpose of reducing these despisers of his authority. The Scotch, however, strengthened by devotional feeling, and a certainty that the English in general were favourable to their cause, formed an army equal in number, which was placed under the command of General Alexander Leslie, an officer who had served with distinction in the long Protestant war carried on against the Emperor of Germany. The Scottish army was encamped on Dunse Law, a hill overlooking the Border, where the duties of military parade were mingled with prayers and preachings, such as were never before witnessed in a camp. The king seeing the wavering of his own men, and the steadfastness of the Scotch, was obliged to open a negotiation, in which it was agreed to disband both armies, and to refer the disputes once more to a General Assembly and a Scottish Parliament.

The king now adopted a new policy with the turbulent people of Scotland. Having formerly gained over some of the English patriots, he thought he might be equally successful with the lords of the Covenant, whom he therefore invited to attend him at Berwick, where the late negotiations had been conducted. A few obeyed the summons; but he failed with all except the Earl (afterwards Marquis) of Montrose, a noble of vigorous genius, whose ambition had been wounded by not having so high a place in the counsels of his countrymen as he thought he deserved. In the new General Assembly and Parliament (1640), the votes were equally decisive against Episcopacy; and though Charles prorogued the latter body before it had completed its proceedings, it nevertheless continued sitting, and voted every measure which it thought necessary. The king collected a second army, and in order to raise money for a second expedition against the Scots, was reduced to the necessity of calling an English Parliament, the first that had met for eleven years. It met (April 13), but, without listening for a moment to a request for subsidies, began to discuss the national grievances. Finding Parliament quite intractable, the king dissolved it (May 5), and endeavoured to obtain supplies in other quarters. A convocation of the clergy granted him £20,000 per annum for the next six years. The nobility and gentry advanced £300,000; but when the city of London was asked for a loan of £200,000, it absolutely refused.

The Scots did not, on this occasion, wait to be attacked by the king, but in August 1640, marched into the north of England, in the expectation of being supported in their claims by the English people in general. A victory gained by them at Newburnford, and their taking possession of Newcastle, together with the manifest disaffection of his own troops, made it necessary that Charles should once more resort to negotiation. It was agreed at a council of peers that all the present dissensions should be referred to the Parliaments of the two countries, the Scottish army being in the meantime kept up on English pay, till such time as they were satisfied with the state of their affairs.

#### THE LONG PARLIAMENT—THE IRISH REBELLION.

The English Parliament met in November, and immediately commenced a series of measures for effectually and permanently abridging the royal authority. There was even a party who, provoked by the late arbitrary measures, contemplated the total abolition of the monarchy, and the establishment of a republic. The first acts of the Parliament had little or no immediate reference to Scotland. The Earl of Strafford was impeached of treason against the liberties of the people, and executed (May 12, 1641), notwithstanding a solemn promise made to him by the king that he should never suffer in person or estate. Archbishop Laud was impeached and imprisoned, but reserved for future vengeance. The remaining ministers of the king only saved themselves by flight. Some of the judges were imprisoned and fined. The abolition of Episcopacy was taken into consideration. The Catholics fell under a severe persecution; and even the person of the queen, who belonged to this faith, was not considered safe.

It was not till August 1641, when the English Parliament had gained many of its objects, that they permitted the treaty of peace with Scotland to be fully ratified. They then gratified the troops not only with their full pay, at the rate of £850 a day, but with a vote of no less a sum than £300,000 besides, of which £80,000 was paid down, as an indirect way of furnishing their party with the means of future resistance. The king, on his part, also took measures for gaining the attachment of this formidable body of soldiery, and of the Scottish nation in general. In Edinburgh, which he visited in August, he squared his conduct carefully with the rigour of Presbyterian manners. In the Parliament he was exceedingly complaisant: he readily ratified all the acts of the preceding irregular session; he yielded up the right of appointing the state officers of Scotland; and he ordained that the Scottish Parliament should meet once every three years without regard to his will—all of which were points of the greatest importance. The men who had acted most conspicuously against him in the late insurrections now became his chief counsellors, and he seemed to bestow favours upon them exactly in proportion to their enmity. He created General Leslie Earl of Leven, putting on his coronet with his own hand. The Earl of Argyle, who had been the chief political leader of the Covenanters, was made a marquis. Many others received promotions in the peerage. The offices of state were distributed amongst them. Thus the affections of the Scots were in a manner set up to auction between the king and his English Parliament, and from both did they receive considerable advantages.

But while thus intriguing with the Covenanting leaders, Charles also kept up a correspondence with a royalist party which had been embodied by the Earl of Montrose. This nobleman was now suffering confinement in Edinburgh Castle for his exertions in favour of the king. An obscure conspiracy which he formed against three of the chief popular nobles, Argyle, Hamilton, and Lanark, as a preliminary step to the re-establishment of the royal power, became known at this time, and did some injury to the king's cause in both countries. After spending about three months in Edinburgh, Charles was called away in consequence of intelligence which reached him from Ireland.

The cruel policy already mentioned, by which large portions of Ireland were depopulated, and then planted with colonies of English and Scotch settlers had been continued during the reign of Charles. In addition to this and other local causes of complaint, the state of religion was one which pervaded nearly the whole country, and was always becoming more and more important. Though the reformed faith had been established for nearly a century, it had made little progress except among the English settlers. The greater part of the nobility, and also of the lower orders, were still attached to the ancient creed; and a Catholic hierarchy, appointed by the Pope, and supported by the people, enjoyed as much respect and obedience as when that religion was countenanced by the state. The refusal of the Catholics to take the oath of supremacy, which acknowledged the king to possess a right which their faith taught them to belong to the Pope, necessarily excluded them from all branches of the public service. There were also penal laws against the profession of Catholicism, and a severe court of Star-Chamber to carry these into execution. Thus situated, the Irish Catholics had two powerful motives to mutiny—a confidence in their numbers, and a constant sense of suffering under the government.

In 1633, the Earl of Strafford was appointed viceroy of Ireland. His government was vigorous, and those institutions which he thought proper to patronise flourished under it; but his great aim was to make the king absolute, and he rather subdued than conciliated the popular spirit. When summoned in 1640 to attend the king in England, he left the Irish government in the hands of Sir William Parsons and Sir John Borlase, as lords justices. Immediately after his departure, the spirit which he thought he had quelled began to reappear, being encouraged both by his absence, and by the success which the Scottish Covenanters had experienced in a war against religious restraint. A conspiracy, involving most of the country without the Pale, and including many persons within it, was formed chiefly under the direction of a gentleman named Roger Moore, who possessed many qualities calculated to endear him to the people. Some circumstances excited the suspicion of the Protestants; and among others, the return of several officers who had been in the service of the king of Spain, under pretence of recruiting for the Spanish army. But the apparent tranquillity of the country baffled all scrutiny.

The 23d of October 1641, being a market-day, was fixed on for the capture of Dublin Castle. During the previous day, nothing had occurred to alarm the authorities. In the evening of the 22d, the conspiracy was accidentally discovered, and measures were taken to save Dublin; but a civil war raged next morning in Ulster, and speedily spread over the country.

The design of Sir Phelim O'Neill, and the other leaders of this insurrection, was simply political. They conceived the time a good and opportune one for striking a blow against the government, as the Scots had successfully done; and their conduct was in the outset characterised by lenity. They could not, however, allay the hatred with which the Catholics looked upon their adversaries; and a spirit of revenge broke out among their followers, which was aggravated to cruel outrage, when they heard that the conspiracy was discovered in Dublin. The spirit of retaliation was let loose, and political wrongs, unfeelingly inflicted, were, as is often the case, ferociously avenged. The massacre of an immense number of Protestants held forth an awful lesson of the effects which oppressive laws produce on the human passions. The government rather aggravated than alleviated the evil, by offering the estates of all in rebellion to those who should aid in reducing them to obedience. This drove the insurgents to desperation, and postponed the complete extinction of the war for several years. It is to be remarked, that though the Irish were struggling for both national and religious freedom, they gained no sympathy from the patriots of Britain, who, on the contrary, urged the

king to suppress the rebellion, being afraid that a religious toleration in Ireland would be inconsistent with the same privilege in their own country. The Scottish Covenanters, themselves so recently emancipated from a restraint upon their consciences, contributed ten thousand troops to assist in restoring a similar restraint upon the Irish!

## THE CIVIL WAR.

It was generally allowed by moderate people, that in the autumn of 1641, at which time the labours of the Parliament had continued one year, the king had granted redress of all the abuses for which the earlier part of his reign, and the British constitution in general, were blameable. If he could have given a guarantee that he never would seek to restore any of these abuses, or attempt to revenge himself upon the men who had been chiefly concerned in causing him to give up, there would have been no further contention. Unfortunately, the character of the king for fidelity to his engagements was not sufficiently high to induce the leaders of the House of Commons to depend upon him: they feared that, if they once permitted him to resume his authority, there would be no longer any safety for them; and they deemed it necessary that things should be prevented from falling into their usual current. They therefore prepared a paper called *The Remonstrance*, containing an elaborate view of all the grievances that had ever existed, or could now be supposed to exist; and this they not only presented to the king, but disseminated widely among the people, with whom it served to increase the prevailing disaffection.

From this time it was seen that the sword could alone decide the quarrel between the king and the Parliament. Charles made an unsuccessful attempt (January 4, 1642) to seize six of the most refractory members, for the purpose of striking terror into the rest. This served to widen still further the breach. In the early part of 1642, the two parties severally employed themselves in preparing for war. Yet, even now, the king granted some additional concessions to his opponents. It was at last, upon a demand of the Parliament for the command of the army—a privilege always before, and since, resting with the crown—that he finally broke off all amicable intercourse. He now retired with his family to York.

The Parliament found its chief support in the mercantile classes of London and of the eastern coast of England, which was then more devoted to trade than the west, and in the Puritan party generally, who were allied intimately with the Presbyterians of Scotland, if not rapidly becoming assimilated with them. Charles, on the other hand, looked for aid to the nobility and gentry, who were able to bring a considerable number of dependants into the field. The Parliamentary party was by the other styled *Roundheads*, in consequence of their wearing short hair; while the friends of the Parliament bestowed upon their opponents the epithet of *Malignants*. The Royalists were also, in the field, termed Cavaliers, from so many of them being horsemen. On the 25th of August 1642 the king erected his standard at Nottingham, and soon found himself at the head of an army of about ten thousand men. The Parliament had superior forces, and a better supply of arms; but both parties were very ignorant of the art of war. The king commanded his own army in person, while the Parliamentary forces were put under the charge of the Earl of Essex.

The first battle took place, October 23, at Edgehill, in Warwickshire, where the king had rather the advantage, though at the expense of a great number of men. He gained some further triumphs before the end of the campaign, but still could not muster so large an army as the Parliament. During the winter, the parties opened a negotiation at Oxford; but the demands of the Parliament being still deemed too great by the king, it came to no successful issue.

Early in the ensuing season, the king gained some considerable advantages; he defeated a Parliamentary

army under Sir William Waller at Stratton, and soon after took the city of Bristol. It only remained for him to take Gloucester, in order to confine the insurrection entirely to the eastern provinces. It was even thought at this time that he might have easily obtained possession of London, and thereby put an end to the war. Instead of making such an attempt, he caused siege to be laid to Gloucester, which the army of Essex relieved when it was just on the point of capitulating. As the Parliamentary army was returning to London, it was attacked by the royal forces at Newbury, and all but defeated. Another section of the royal army in the north, under the Marquis of Newcastle, gained some advantages; and, upon the whole, at the close of the campaign of 1643, the Parliamentary cause was by no means in a flourishing condition.

In this war there was hardly any respectable military quality exhibited besides courage. The Royalists used to rush upon the enemy opposed to them, without any other design than to cut down as many as possible, and when any part of the army was successful, it never returned to the field while a single enemy remained to be pursued; the consequence of which was, that one wing was sometimes victorious, while the remainder was completely beaten. The Parliamentary troops, though animated by an enthusiastic feeling of religion, were somewhat staid, but nevertheless had no extensive or combined plan of military operations. The first appearance of a superior kind of discipline was exhibited in a regiment of horse commanded by Oliver Cromwell, a gentleman of small fortune, who had been a brewer, but was destined, by great talent, hypocrisy, and address, joined to an unrelenting disposition, to rise to supreme authority. Cromwell, though himself inexperienced in military affairs, showed from the very first a power of drilling and managing troops, which no other man in either army seemed to possess. Hence his regiment soon became famous for its exploits.

#### SOLEMN LEAGUE AND COVENANT.

The Royal successes of 1643 distressed alike the English Parliament and the Scottish nation, who now began to fear the loss of all the political meliorations they had wrested from the king. The two Parliaments therefore entered, in July, into a *Solemn League and Covenant*, for prosecuting the war in concert, with the view of ultimately settling both church and state in a manner consistent with the liberties of the people. In terms of this bond, the Scots raised an army of twenty-one thousand men, who entered England in January 1644; and on the 1st of July, in company with a large body of English forces, overthrew the king's northern army on Long Marston Moor.

The conduct of the Scottish nation in this transaction was not unexceptionable. They had been gratified in 1641 with a redress of every grievance they could name; since which time the king had not given them the least cause of complaint. In now raising war against him, they had no excuse but the very equivocal one, that it was necessary to guard against the possibility of his afterwards being able to injure them. They were also acting on English pay, a proceeding not very consistent with their pretensions to independence. The mainspring of their policy was a hope of being able to establish the Presbyterian religion in England. The Episcopal church being now abolished, divines were nominated by both nations to meet at Westminster, in order to settle a new form of worship and church government; and after a protracted course of deliberation, it was agreed that the Presbyterian system should be adopted, though in England it was provided that the new church should not have any connection with or influence over the state.

The defeat at Long Marston was severely felt by the king. He gained a victory over Waller at Copredy Bridge, and caused Essex's army to capitulate in Cornwall (September 1); but in consequence of a second fight at Newbury (October 27), in which he suffered a defeat, he was left at the end of the campaign with

greatly diminished resources. A new negotiation was commenced at Uxbridge; but the terms asked by the Parliament were so exorbitant, as to show no sincere desire of ending the war.

In truth, though the Presbyterian party were perhaps anxious for peace, there was another party, now fast rising into importance, who were actuated by no such wishes. These were the Independents, a body of men who wished to see a republic established in the state, and all formalities whatever removed from the national religion. Among the leaders of the party was Oliver Cromwell, whose mind seems to have already become inspired with lofty views of personal aggrandisement. This extraordinary man had sufficient address to carry a famous act called the *Self-Denying Ordinance*, which ostensibly aimed at depriving all members of the legislature of commands in the army, but had the effect only of displacing a few noblemen who were obnoxious to his designs. He also carried an act for modelling the army anew, in which process he took care that all who might be expected to oppose his views should be excluded. It was this party more particularly that prevented any accommodation taking place between the king and his subjects.

#### MONTROSE'S CAREER IN SCOTLAND.

While the negotiation was pending, the Marquis (formerly Earl) of Montrose produced a diversion in Scotland in favour of the king. Having got 1500 foot from Ireland, to which he added a few Perthshire Highlanders, he descended upon the Lowlands, and on the 1st of September (1644) gained a complete victory over a larger and better-armed force at Tippermuir. At Aberdeen, whither he went for the purpose of increasing his army, he gained another victory over a superior body of Covenanters. He was then pursued by a third army, under the Marquis of Argyle, and after some rapid movements, seemed to dissolve his forces in the Highlands. Ere his enemies were aware, he burst in the middle of winter into the country of his great rival Argyle, which he did not leave till he had made it a desert. Finding himself timidly followed by the marquis, at the head of a large body of the clan Campbell, he turned suddenly, and falling upon them at Inverlochry (February 2, 1645), gained a complete victory. He then moved along the eastern frontier of the Highlands, where he found himself opposed by a fourth army under General Baillie. After sacking the town of Dundee, and eluding Baillie's troops, he encountered at Aldearn, in Nairnshire (May 4), a greatly superior force, which he also overthrew. Then turning upon Baillie, whom he met at Alford, in Aberdeenshire (July 2), he gained a fifth victory, almost as complete as any of the rest.

In all these battles Montrose carried everything before him by the spirit of his first onset, and the slaughter was in general very great. He now descended to the Lowlands, and at Kilsyth, near Glasgow, was opposed by an army of 6000 men, whom the insurgent government at Edinburgh had hastily assembled from Fife and Perthshire. These, with a much smaller force, he also defeated (August 15), killing great numbers in the pursuit. The committees of church and state then broke up and left the kingdom, leaving him in appearance its sole master. His successes had in the meantime given the king hopes of carrying on the war with success; but Montrose had in reality gained no sure advantages. Besides his small army of mingled Irish and Highlanders, there was hardly any portion of the nation who did not regard him as only a great public enemy. While lying with a diminished force at Philiphaugh, near Selkirk, he was surprised (September 11) by a detachment of the regular Scottish army, under General David Leslie, who completely defeated his troops, and obliged him to leave the kingdom. His having gained six victories in succession, over larger bodies of men; has procured for him a distinguished name; but his cruelty, and the ambition to which his motives were confined, detract from his character.

CONCLUSION OF THE CIVIL WAR.

The English campaign of 1645 ended in the complete overthrow of the king. Throughout the war, his enemies had been continually improving in discipline, in conduct, and in that enthusiasm which animated them so largely; while the Royalists had become, out of a mere principle of opposition, so extremely licentious, as to be rather a terror to their friends than to their enemies. The new-modelling of the Parliamentary army, which took place early in 1645, had also added much to the effectiveness of the troops, who were now nominally commanded by Sir Thomas Fairfax, but in reality by Oliver Cromwell, who bore the rank of lieutenant-general. The consequence was that, in a pitched battle at Naseby (June 14), the king was so completely beaten, that he and his party could no longer keep the field. He had no resource but to retire into Oxford, a town zealously affected to his cause, and well fortified.

He endeavoured, from this forlorn position, to renew the negotiations for a peace; but every attempt of that kind was frustrated by the Independents, who, though a minority in the House of Commons, possessed great power through the army, and, as already mentioned, were desirous of effecting greater changes in church and state than those for which the war was originally undertaken. Dreading the influence of this body, Charles retired privately from Oxford (May 1646) on the approach of the Parliamentary forces, and put himself under the protection of the Scottish army at Newark.

As the views of the Scotch throughout the war had been steadily confined to the security of the Presbyterian religion, along with the safety of the king's person and the establishment of a limited monarchy, they received him with great respect at their camp, and entered into negotiations for effecting their grand object. If Charles would have acceded to their views, he might have immediately resumed a great part of his former power; and the agitations of many subsequent years, as well as his own life, might have been spared. But this was forbidden, not only by his strong prepossession in favour of the Episcopal form of worship, but also by his conviction, that the Episcopal form of church government was alone compatible with the existence of monarchy. He therefore disagreed with the Presbyterians on the very point which they considered the most vital and important.

From the time when Charles first threw himself into the Scottish camp, the English Parliament had made repeated and strenuous demands for the surrender of his person into their hands. The Scots, however, though acting partly as a mercenary army, asserted their right, as an independent nation under the authority of the king, to retain and protect him. At length, despairing of inducing him to sanction the Presbyterian forms, and tempted by the sum of £400,000, which was given to them as a compensation for their arrears of pay, they consented to deliver up their monarch, but certainly without any apprehension of his life being in danger, and, indeed, to a party quite different from that by which he afterwards suffered. The Scottish army then retired (January 1647) to their native country, and were there disbanded.

The king was now placed in Holdenby Castle, and negotiations were opened for restoring him to power, under certain restrictions. While these were pending, the Parliament deemed it unnecessary to keep up the army, more especially as its spirit was plainly observed to be of a dangerous character. On attempting, however, to dismiss this powerful force, the English Commons found that their late servants were become their masters. The troops began to hold something like a Parliament in their own camp; a party of them, under Cornet Joyce, seized the king's person, and brought him to Hampton Court. Cromwell, who was at the bottom of their machinations, received from them the chief command; and at his instigation they retorted upon the Parliament with a demand for the dismissal of the leaders of the Presbyterian party, and a general

right of new-modelling the government and settling the nation. The House of Commons, supported by the city of London, made a bold opposition to these demands, but was ultimately obliged to yield to a force which it had no means of resisting. From that time military violence exercised an almost uncontrolled mastery over England.

TRIAL AND EXECUTION OF THE KING.

The leaders of the army being anxious to fortify themselves by all possible means against the Presbyterians, opened a negotiation with the king, whose influence, such as it now was, they proposed to purchase, by allowing Episcopacy to be the state religion, and leaving him in command of the militia. Charles, however, with characteristic insincerity, carried on at the same time a negotiation with the Presbyterians, which, being discovered by the military chiefs, caused them to break off all terms with him. Under dread of their resentment, he made his escape from Hampton Court (November 11, 1647); and after an unsuccessful attempt to leave the kingdom, was obliged to put himself under the charge of the governor of Carisbrooke Castle, in the Isle of Wight. Here he entered upon a new negotiation with the House of Commons, to whom he made proposals, and from whom he received certain proposals in return; all of which were, however, rendered of non-avail by a secret treaty which he at the same time carried on with a moderate party of the Scottish Presbyterians.

He finally agreed with the latter party, but under strict secrecy, to give their form of church government a trial of three years, and yield to them in several other points; they, in return, binding themselves to unite their strength with the English Royalists, for the purpose of putting down the Independent party, now predominant in the English Parliament. With some difficulty the Duke of Hamilton and others, who conducted this negotiation, succeeded, by a vote of the Scottish Parliament, in raising an army of 12,000 men, with which they invaded England in the summer of 1648. The more zeal of the clergy and people of Scotland protested against an enterprise, which, from its co-operating with Royalists and Episcopalians, and not perfectly insuring the ascendancy of the Presbyterian church, appeared to them as neither deserving of success nor likely to command it. As the Scottish army penetrated the western counties, parties of Presbyterians and Royalists rose in different parts of England, and for some time the ascendancy of the Independents seemed to be in considerable peril. But before the forces of the enemy could be brought together, Cromwell, with 8000 veteran troops, attacked and overthrew Hamilton at Preston, while Fairfax put down the insurgents in Kent and Essex. Hamilton was himself taken prisoner, and very few of his troops ever returned to their native country.

While Cromwell was employed in suppressing this insurrection, and in restoring a friendly government in Scotland, the Presbyterians of the House of Commons, relieved from military intimidation, entered upon a new negotiation with Charles, which was drawing towards what appeared a successful conclusion—though the king secretly designed to deceive them, and to pursue other means for an effectual restoration—when the army returned to London, breathing vengeance against him for this last war, of which they considered him as the author. Finding the Parliament in the act of voting his concessions to be satisfactory, Cromwell sent two regiments, under Colonel Pride, who forcibly excluded from it about two hundred members of the Presbyterian party; a transaction remembered by the epithet of *Pride's Purge*. The remainder, being chiefly Independents, were ready to give a colour of law to whatever farther measure might be dictated by the military leaders. Convinced of the utter faithlessness of the king, and that, if he continued to live, he would take the earliest opportunity of revenging himself for what had already been done, Cromwell and his asso-

ciates resolved to put him to death. A High Court of Justice, as it was called, was appointed by ordinance, consisting of a hundred and thirty-three persons, named indifferently from the Parliament, the army, and such of the citizens as were known to be well affected to the Independent party. This body sat down in Westminster Hall (January 20, 1649), under the presidency of a barrister named Bradshaw, while another named Coke acted as solicitor for the people of England. Charles, who had been removed to St James's Palace, was brought before this court, and accused of having waged and renewed war upon his people, and of having attempted to establish tyranny in place of the limited regal power with which he had been intrusted. He denied the authority of the court, and protested against the whole of the proceedings, but was nevertheless found guilty and condemned to die. On the 30th of January, he was accordingly beheaded in front of his palace of Whitehall. The people were in general horror-struck at this event; but they were too effectually kept in check by the army to have any influence in preventing or resenting it.

Charles I. was a man of slender person, of the middle size, and of a grave and somewhat melancholy cast of countenance. He had not a gracious manner, but possessed considerable dignity. He was sincerely attached to the Church of England, for which he might be considered as a martyr, and he was able to reason very acutely in favour of the divine origin of Episcopacy. The general opinion of modern times respecting his political conduct is unfavourable; though few deny that his death was a most disgraceful, as well as imprudent act, on the part of those who brought it about. The worst point of his character was his insincerity: he was prone to using equivocations, with a view to deceive his opponents, and therefore no enemy could depend upon him in negotiation. In private life he was a virtuous man, and he is entitled to much credit for the taste which he displayed in the encouragement of the fine arts. He left three sons—Charles, Prince of Wales; James, Duke of York, afterwards James II.; and Henry, Duke of Gloucester, who died in early life. He also left several daughters, one of whom, named Elizabeth, was treated with much harshness by the new government, and died not long after him in prison.

In the reign of Charles I., the chief literary men were Ben Jonson and Philip Massinger, dramatists, and Samuel Daniel, Michael Drayton, and William Drummond, poets. The most eminent philosophical character was Dr William Harvey, who discovered the circulation of the blood. Elegant architecture was now for the first time introduced into private buildings. The king patronised the Dutch artists, Rubens and Vandyke, and collected many fine pictures, which were afterwards sold by his enemies. The Excise and the tax upon landed property were introduced by the Parliament, in order to support the war against the king. When the Parliamentary party became triumphant, it suppressed the theatre, which was not again set up till the restoration of monarchy.

#### THE COMMONWEALTH—SUBJUGATION OF IRELAND AND SCOTLAND.

Though the execution of the king produced a considerable reaction in favour of royalty, the small remaining part of the House of Commons, which got the ridiculous nickname of the *Rump*, now established a republic, under the title of the Commonwealth, the executive being trusted, under great limitations, to a council of forty-one members, while in reality Cromwell possessed the chief influence. The House of Peers was voted a grievance, and abolished, and the people were declared to be the legitimate source of all power. Soon after the king's death, the Duke of Hamilton, and a few other of his chief adherents, were executed.

During the progress of the civil war, Ireland had been the scene of almost ceaseless contention among the various parties of the king, the English House of Commons, and the Catholics, none of which could effectually

suppress the rest. The most remarkable event was a secret agreement which Charles made, in 1646, with the Earl of Glamorgan, to establish the Catholic religion in Ireland, on condition that its partisans should assist him in putting down his enemies in England and Scotland; a transaction which ultimately injured his reputation, without leading to any solid advantage. At the time of his execution, the Royalists were in considerable strength under the Duke of Ormond, while Hugh O'Neill was at the head of a large party of Catholics, who were not indisposed to join the other party, provided they could be assured of the establishment of their religion. While the two parties in union could have easily rescued the country from the English connection, Cromwell landed (August 1649) with 12,000 horse and foot, and in a series of victories over the scattered forces of his various opponents, succeeded without any great difficulty in asserting the sway of the Commonwealth. One of his most important actions was the capture of Drogheda, where he put the garrison and a number of Catholic priests to the sword, in order to strike terror into the nation.

The people of Scotland, who had had scarcely any other object in the civil war than the establishment of their favourite form of worship, and were sincere friends to a limited monarchy, heard of the death of the king with the greatest indignation, and immediately proclaimed his eldest son Charles. Early in 1650, the young monarch, who had taken refuge in Holland, sent Montrose with a small force to attempt a Cavalier insurrection in Scotland; but this nobleman being taken and put to death, Charles found it necessary to accede to the views of the Scotch respecting the Presbyterian religion, and he was accordingly brought over and put at the head of a considerable army, though under great restrictions. Cromwell, who had now nearly completed the conquest of Ireland, lost no time in returning to London, and organising an army for the suppression of this new attempt against the Commonwealth.

On the 19th of July he crossed the Tweed, and advanced through a deserted country to Edinburgh, where the Scottish army lay in a fortified camp. Sickness in his army, and the want of provisions, soon after compelled him to retreat; and the Scottish army, following upon his rear, brought him into a straitened position near Dunbar, where he would soon have been under the necessity of surrendering. In the midst of his perplexities (September 3), he beheld the Scots advancing from the neighbouring heights to give him battle, and, in a transport of joy, exclaimed, 'The Lord hath delivered them into our hands!' The movement was solely the result of interference on the part of the clergy who followed the Scottish camp: the better sense of General Leslie would have waited for the voluntary surrender of his enemy. In the fight which ensued, the veteran troops of Cromwell soon proved victorious. The Scots fled in consternation and confusion, and were cut down in thousands by their pursuers. This gained for Cromwell the possession of the capital and of all the south-east provinces; but the Covenanters still made a strong appearance at Stirling.

Cromwell spent a whole year in the country, vainly endeavouring to bring on another action. During the interval (January 1, 1651), the Scots crowned the young king at Scone, part of the ceremony consisting in his acceptance of the Solemn League and Covenant. In the ensuing summer, Cromwell at length contrived to outflank the position of the Scottish army; but the result was, that Charles led his troops into England without opposition, and made a very threatening advance upon the capital. Ere the Royalists had time to rally around him, Cromwell overtook the king at Worcester, where, after a stoutly-contested fight (September 3, 1651), he proved completely victorious. Charles, with great difficulty, escaped abroad, and Scotland, no longer possessed of a military force to defend itself, submitted to the conqueror. All the courts of the Scottish church were suppressed, and the ministers were left no privilege but that of preaching to their flocks. The country

was kept in check by a small army under General Monk, and in a short time was declared by proclamation to be united with England. Thus was the Independent party, or rather Cromwell, left without a single armed enemy. All the efforts of the people during twelve years to obtain limitations upon the monarchy, had ended in a military despotism!

THE PROTECTORATE.

After the country and its dependencies had been thoroughly settled under the new government, the republican leaders resolved upon commencing hostilities against Holland, which, during the civil war, had manifested a decided leaning towards the king, and had recently treated the triumphant party with marked disrespect. In the summer of 1652, the Dutch fleet, under its famous commanders Van Tromp, De Ruyter, and De Witt, had several encounters with the English ships, under Admirals Blake and Ayscue, without any decided success on either side. But in the ensuing spring, an action was fought between Blake and Van Tromp, in which the latter lost eleven ships. The Dutch then sued for peace, which the Rump Parliament, for various reasons, were little inclined to grant. Their principal motive for prosecuting the war, was a conviction that it tended to restrict the power of Cromwell, to whom they now paid by no means a willing obedience. Cromwell, perceiving their design, proceeded with 300 soldiers to the House (April 1653), and entering with marks of the most violent indignation, loaded the members with reproaches for their robbery and oppression of the public; then stamping with his foot, he gave signal for the soldiers to enter, and addressing himself to the members, 'For shame!' said he; 'get you gone! give place to honest men! I tell you you are no longer a Parliament: the Lord has done with you!' He then commanded 'that bauble,' meaning the mace, to be taken away, turned out the members, and locking the door, returned to Whitehall with the key in his pocket.

Being still willing to keep up the appearance of a representative government, Cromwell summoned one hundred and forty-four persons in England, Ireland, and Scotland, to assemble as a Parliament. These individuals, chiefly remarkable for fanaticism and ignorance, were denominated the *Barebones Parliament*, from the name of one of the members, a leather-seller, whose assumed name, by a ridiculous usage of the age, was Praise-God Barebones. As the assembly obtained no public respect, Cromwell took an early opportunity of dismissing it. His officers then constituted him Protector of the Commonwealth of Great Britain and Ireland, with most of the prerogatives of the late king.

The war against Holland was still carried on with great spirit. In the summer of 1653, two naval actions, in which both parties fought with the utmost bravery, terminated in the triumph of the English, and the complete humiliation of the Dutch, who obtained peace on the condition of paying homage to the English flag, expelling the young king from their dominions, and paying a compensation for certain losses to the East India Company. In a war which he subsequently made against Spain, the fleets of the Protector performed some exploits of not less importance. The respect which he thus gained for the English name throughout Europe, is one of the brightest points in his singular history. But while generally successful abroad, he experienced unceasing difficulties in the management of affairs at home. Of the various Parliaments which he summoned, no one was found so carefully composed of his own creatures as to yield readily to his will: he was obliged to dissolve them all in succession, after a short trial. He also experienced great difficulty in raising money, and sometimes applied for loans in the city without success. His own officers could scarcely be kept in subordination, but were constantly plotting a reduction of his authority. The Royalists, on the other hand, never ceased to conspire for his destruction; one, named Colonel Titus, went so far as to recommend his assassination in a pamphlet entitled 'Killing no

Murder,' after reading which he was never seen again to smile.

The last Parliament called by Cromwell was in January 1656; when, besides the Commons, he summoned the few remaining peers, and endeavoured, by ennobling some of his officers, to make up a kind of Upper House. This assembly proved as intractable as its predecessors, and he contracted such a disgust at the very nature of a representative legislature, as to resolve, like Charles I., never to call another. His health finally sank under the effects of his ill-gotten power, and he died on the 3d September 1658, a day which was thought to be propitious to him, as it was the anniversary of several of his victories. His eldest son, Richard, a weak young man, succeeded him as Protector, and was at first treated with all imaginable respect; but he could not long maintain a rule which even his father had ultimately failed in asserting. He quietly slunk out of public view, leaving the supreme authority in the hands of the Rump, which had taken the opportunity to reassemble.

THE RESTORATION—DUTCH WAR.

This remnant of an old Parliament continued in power till the autumn of 1659, when it gave way to a council of the officers who had been in command under Cromwell. The latter government, in its turn, yielded to the Rump, which sat down once more in December. The people, finding themselves made the sport of a few ambitious adventurers, began to long for some more fixed and respectable kind of government. At this crisis, General Monk, commander of the forces in Scotland, conceived the design of settling the nation. He left Scotland (January 2, 1660), with a considerable army; and though he kept his thoughts scrupulously to himself, all men bent their eyes upon him, as a person destined to realise their hopes. He reached London (February 3), and was received with feigned respect by the Rump. Some resistance was attempted by Lambert, one of Cromwell's officers, but in vain. Ere long, Monk was able to procure the restoration of the members who had been excluded from Parliament by Cromwell, who, being a majority, gave an immediate ascendancy to anti-republican views. As soon as this was effected, an act was passed for calling a new and freely-elected Parliament; after which, the existing assembly immediately dissolved itself.

The new Parliament proved to be chiefly composed of Cavaliers and Presbyterians, men agreeing in their attachment to monarchy, though differing in many other views. After some cautious procedure, in which the fears inspired by the late military tyranny were conspicuous, they agreed to invite the king from his retirement in Holland, and to restore him to the throne lost by his father. They were so glad to escape from the existing disorders, that they never thought of making any preliminary arrangement with the king as to the extent of his prerogative. On the 29th of May, being his thirtieth birthday, Charles II. entered London amidst such frantic demonstrations of joy, that he could not help thinking it his own fault, as he said, that he had been so long separated from his people.

One of the first measures of the new monarch was the passing of a bill of indemnity, by which all persons concerned in the late popular movements were pardoned, excepting a few who had been prominently concerned in bringing the king to the block. Harrison, Scrope, and a few other regicides, were tried and executed; and the bodies of Cromwell, Ireton, and Bradshaw, were raised from the grave and exhibited upon gibbets. In Scotland, only three persons suffered—the Marquis of Argyle, Johnston of Warriston, and Mr Guthry, a clergyman: it was considered remarkable, that the marquis had placed the crown upon the king's head at Scoone in the year 1651. Excepting in these acts, the king showed no desire of revenging the death of his father, or his own exclusion from the throne. The Parliament which called him home was constituted a legal one by his own ratification of an act for that purpose. In the settlement of other matters, it seemed

the prevailing wish that all the institutions of the country should be made as nearly what they were before the civil war as possible. Thus the Episcopal church was established both in England and Scotland, though not without causing about a third of the clergy in both countries to resign their charges. The stern and enthusiastic piety which prevailed during the civil war, was now treated with ridicule, and the most of the people vied with each other in that licentious riot and drunkenness which is condemned by all systems of faith. The nation, in fact, seemed intoxicated with the safety which they supposed themselves to have at length gained, in a restoration to the imperfect freedom they enjoyed before the civil war.

Ireland, which, during the Protectorate, had been managed by Henry, a younger son of Cromwell, acceded to the Restoration with as much readiness as any other part of the British dominions. An act was passed for settling property, by which the Catholics obtained some slight benefits, but which, in its main effects, tended to confirm the rights of the settlers introduced by Cromwell.

Though Charles had been restored with the approbation of a very large portion of his subjects, his most zealous friends were the Royalists and Episcopalians; hence he almost immediately subsided into the character of a party ruler. It was deemed necessary that he should maintain an armed force for the protection of his person, and to keep down popular disturbances. He therefore caused several horse regiments to be embodied under the name of Life Guards, being chiefly composed of Royalist gentlemen upon whom a perfect dependence could be placed; and he afterwards added two or three foot regiments, the whole amounting to about 5000 men. The king paid these troops chiefly out of the money allowed for his own support, for Parliament did not sanction his keeping up such a force, and the nation generally beheld it with suspicion. This was the commencement of a *standing army* in England.

Personally indolent, dissolute, and deficient in conscientiousness, and surrounded almost exclusively by the ministers of the basest pleasures, Charles was not qualified to retain the sincere respect of a people whose habitual character is grave and virtuous. His extravagant expenditure soon cooled the affections of his Parliament, and he began to find considerable difficulties in obtaining money. To relieve himself from this embarrassment, he accepted £40,000 from the French king for Dunkirk, a French port, which had been acquired by Cromwell. For the same purpose, he married a Portuguese princess of the Catholic religion, who possessed a dowry of half a million. He also commenced (1664) a war against Holland, for apparently no better reason than that, in applying the Parliamentary subsidies necessary for keeping up hostilities, he might have an opportunity of converting part of the money to his own personal use.

This Dutch war was chiefly conducted by sea. On the 3d of June 1665, an English fleet of 114 sail met a Dutch one which numbered just one ship less, near Lowestoffe, and after an obstinate fight, gained a complete victory, depriving the enemy of eighteen vessels, and compelling the rest to take refuge on their own coast. The commander on this occasion was the Duke of York, the king's younger brother; a man of greater application and more steady principles, but who soon after became unpopular, in consequence of his avowing himself a Catholic.

Some other well-contested actions took place at sea, and the English, upon the whole, confirmed their naval supremacy. Owing, however, to a failure of the supplies, the king was obliged to lay up his best vessels in ordinary, and to send only an inferior force to sea. The Dutch took advantage of this occurrence to send a fleet up the Thames (June 10, 1667), which, meeting with no adequate resistance, threatened to lay the capital in ruins and destroy its shipping. Fortunately, the Dutch admiral did not think it expedient to make this attempt, but retired with the ebb of the tide, after having sunk

and burnt nearly twenty vessels, and done much other damage. The king, finding himself rather impoverished than enriched by the war, soon after concluded a peace.

#### PLAGUE AND FIRE OF LONDON—PERSECUTION IN SCOTLAND.

In the meantime two extraordinary calamities had befallen the metropolis. In the summer of 1665, London was visited by a plague, which swept off about 100,000 people, and did not experience any abatement till the approach of cold weather. On this occasion the city presented a wide and heartrending scene of misery and desolation. Rows of houses stood tenantless, and open to the winds; the chief thoroughfares were overgrown with grass. The few individuals who ventured abroad, walked in the middle of the streets, and when they met, declined on opposite sides to avoid the contact of each other. At one moment were heard the ravings of delirium, or the wail of sorrow, from the infected dwelling; at another the merry song or careless laugh from the tavern, where men were seeking to drown in debauchery all sense of their awful situation. Since 1665, the plague has not again occurred in London, or in any other part of the kingdom.

The second calamity was a conflagration, which commenced on the night of Sunday the 2d of September 1666, in the eastern and more crowded part of the city. The direction and violence of the wind, the combustible nature of the houses, and the defective arrangements of that age for extinguishing fires, combined to favour the progress of the flames, which raged during the whole of the week, and burnt all that part of the city which lies between the Tower and the Temple. By this calamity, 13,200 houses and 89 churches, covering in all 430 acres of ground, were destroyed. The flame at one time formed a column a mile in diameter, and seemed to mingle with the clouds. It rendered the night as clear as day for ten miles around the city, and is said to have produced an effect upon the sky which was observed on the borders of Scotland. It had one good effect, in causing the streets to be formed much wider than before, by which the city was rendered more healthy. By the populace, this fire was believed to have been the work of the Catholics, and a tall pillar, with an inscription to that effect, was reared in the city, as a monument of the calamity. This pillar with its inscription still exists; but the fire is now believed to have been occasioned purely by accident.

Meanwhile, in Scotland great dissatisfaction had been occasioned by the imposition of Episcopacy upon the church, and advantage had been taken of various acts of resistance on the part of the clergy and people, to visit both with measures of considerable severity. Heavy fines were imposed upon such as failed to attend the ministrations of the established clergy, on the suspicion that, when not at church, they were hearing the ejected clergymen in some private place. A small standing army was kept up to enforce the fines, and, till these were paid, free quarters were exacted for the soldiers. Tired of suffering, a few of the peasantry of Galloway rose in rebellion (November 1666), and advancing through the disaffected districts of Ayrshire and Lanarkshire, gradually assumed a threatening appearance. An unfortunate movement towards Edinburgh, where they expected accessions, thinned their numbers, and they were overpowered by General Dalryell at the Pentland Hills. Thirty-four of the prisoners were executed as rebels, chiefly at the instigation of Sharpe, Archbishop of St Andrews, who, with the other prelates, was peculiarly zealous in behalf of the government. Besides these sufferers, fifty persons, including fifteen clergymen, forfeited lands and goods.

Some attempts were now made, at the desire of the king, to induce the ejected clergy to connect themselves with the church; but very few took advantage of a leniency which they believed would have been extended also to Catholics, and which involved their acknowledgment of the king's supremacy in spiritual affairs. About the year 1670, some divines began to hold conventicles in secluded parts of the country, to

which the country people used to come with arms. At these places a far warmer kind of devotion was felt than could be experienced under tamer circumstances; and, as may be supposed, such meetings were not calculated to diffuse or foster a sentiment of loyalty. Sensible of this, the government obtained an act, imposing very severe fines on all who should preach or listen at conventicles; but without producing any effect. The penalties with which they were threatened seemed only to make the people more attached to their peculiar modes of worship and church government.

THE TRIPLE ALLIANCE—THE FRENCH ALLIANCE.

The kingdom of France was at this period, under Louis XIV., rising into a degree of power and wealth which it had never before known. Louis had some claims through his wife upon the Netherlands (since called Belgium), which were then part of the Spanish dominions. He accordingly endeavoured to possess himself of that country by force of arms. A jealousy of his increasing power, and of the Catholic religion, professed by his people, induced the English to wish that his aggressions should be restrained. To gratify them, Charles entered into an alliance with Holland and Sweden, for the purpose of checking the progress of the French king. In this object he was completely successful, and consequently he became very popular. The Parliament, however, having disappointed him of supplies, he soon after entirely changed his policy, and with the assistance of five abandoned ministers—Clifford, Ashley, Buckingham, Arlington, and Lauderdale, who were called the CABAL, from the initials of their names forming that word, resolved to render himself, if possible, independent of Parliament; in other words, an absolute prince. In consideration of a large bribe from Louis, he agreed to join France in a war against Holland, with a view of putting an end to that example of a Protestant republic.

War was accordingly declared in May 1672, and the naval force of England was employed in meeting that of the Dutch by sea; while Louis led a powerful army across the Rhine, and in a very short time had nearly reduced the whole of the Seven Provinces. In this emergency the Dutch could only save themselves from absolute ruin by laying a great part of their country under water. The English, who had not entered heartily into this war, soon began to be alarmed for the fate of Holland, which was almost their only support against the dread of Popery; and though forbidden under severe penalties to censure the government measures, they soon contrived to exhibit so much dissatisfaction, as to render a change of policy unavoidable.

The king found it necessary to assemble his Parliament (February 1673), and it was no sooner met than it passed some acts highly unfavourable to his designs. Among these was the famous Test Act, so called because it enacted the imposition of a religious oath upon all persons about to enter the public service, the design being to exclude the Catholics from office. Above all things, the House of Commons declared that it would grant no more supplies for the Dutch war. The king resolved to prorogue the assembly; but before he could do so, they voted the alliance with France, and several of his ministers, to be *grievances*. Charles, who, in wishing to be absolute, had been inspired by no other motive than a desire of ease, now saw that there was a better chance of his favourite indulgence in giving way to his subjects than in any other course; and he at once abandoned all his former measures, and concluded a separate peace with Holland. This country was now beginning, under the conduct of the Prince of Orange, to make a good defence against the French, which it was the better enabled to do by obtaining the friendship of Germany and Spain. In the year 1678, after a war which, without any decisive victories, will ever reflect lustre upon Holland, a peace was concluded. The Prince of Orange, in the previous year, had married the Princess Mary, eldest daughter of the Duke of York, and educated in the reformed faith—an alliance

which pleased the English, from its strengthening the Protestant interest, and which was destined, some years after, to bring about important results.

During the whole of this reign the corruptness of the court was very great; but it was in some measure the protection of the public. Charles spent vast sums in debauchery, and thus made himself more dependent on his Commons than he would otherwise have been. Many of the Commons were exceedingly corrupt, and all kinds of evil methods were adopted to render them more so. Bribes were distributed among them, and they were frequently *closed*; that is, brought into the presence of the king individually, and personally solicited for votes. Still a considerable party maintained its purity and independence, and long kept a majority against the court.

THE POPISH PLOT.

For a century past, one of the grand moving-springs of the public conduct had been a strong detestation and dread of the adherents of the Romish church. This sentiment did not arise from any fear of the numbers or political strength of the Catholics, for they were but a small minority of the nation, but from a belief generally entertained that the Catholics scrupled at no treachery or cruelty which might seem favourable to the re-establishment of their religion. The popular notions, newly inflamed by the avowed Catholicism of the Duke of York, heir-presumptive to the crown, and by the late intrigues of the king with France, were encouraged by a party who wished to impose restrictions upon the royal prerogative, and to exclude the duke from the succession. In 1678, an account of a plot, supposed to have been formed by the Papists, for burning London, massacring the Protestants, and destroying the king and the Protestant religion, was circulated by one Kirby, a chemist; Tong, a weak, credulous person; and Titus Oates, one of the most abandoned miscreants that ever appeared in history. The circumstances attending this pretended discovery were so unlike reality, that if the nation had not been in a state of hallucination at the time, they never could have been for a moment listened to.

Nevertheless, the Popish Plot, as it was called, was not only generally believed by the people, but also by the Parliament and the court; and such was the extent of the excitement, that a general massacre of the Catholics was apprehended. Even the king, though incredulous, was obliged to give way to the prevailing delusion. Meanwhile letters were seized, which discovered that the Duke of York carried on a correspondence with France, in opposition to the religion and interests of his country. A correspondence of the king's minister Danby, which involved the king in the disgrace of similar machinations, was detected; and to crown the whole, Sir Edmondsbury Godfrey, the magistrate who first gave publicity to the plot, was found in the fields dead, with his own sword stuck through his body. For two years this horrible delusion reigned over the public mind, and under its influence many innocent Catholics were condemned to death. At length the execution of a venerable nobleman, the Viscount Stafford, excited a general sensation of pity, and the people gradually saw and repented of the excesses which they had committed.

THE HABEAS CORPUS ACT—THE EXCLUSION BILL.

At this period the House of Commons appears for the first time formally separated into the two parties who have ever since been recognised in it. The appellation *Tory*, applied to the friends of the Court, was originally brought from Ireland, where the word *Tories* (give me), used by a Cavalier banditti, had gradually been extended to the whole of the Cavalier or Royalist party. The term *Whig*, which fell to the lot of the Opposition, is said to have originated in Scotland, being first applied to the sterner portion of the Presbyterian party in the western counties.

The Parliament having impeached Danby, the king

dissolved it, and called another. The new assembly, which met in October 1679, proved equally uncontrollable as the last. It passed, by a majority of seventy-nine, a bill excluding the Duke of York from the succession; declared the king's Guards and standing army illegal; and passed the *Habeas Corpus* act, which, limiting the time between the apprehension of a supposed criminal and his trial, rendered it impossible for this or any future sovereign to keep individuals in prison at his pleasure, as had formerly been done. The last measure is still justly looked upon as the great bulwark of personal liberty in Britain. Though the bill for excluding the Duke of York was thrown out by the Upper House, that prince found it necessary to evade the popular odium, first by retiring to Brussels, and afterwards to Scotland. At the same time, the Duke of Monmouth, eldest natural son of the king, and believed by many to be legitimate, began to be regarded by the Presbyterians and liberal party in general as a preferable heir to the crown. In these agitations, the populace of London was particularly active; and it was at this period that the term *mob* was first used. The word was an abbreviation of *mobile vulgus*, a phrase signifying 'the unsteady vulgar,' which the court contemptuously applied to the crowds which daily assembled.

PERSECUTION IN SCOTLAND.

The persecution in Scotland for field-meetings was so severe, that, before the year 1678, it was supposed that 17,000 persons had suffered by it in fine, imprisonment, and death. A bond was attempted to be imposed upon the people, in which conventicles were renounced; and to enforce it in the west country, an army of 10,000 Highlanders was permitted to range there at free quarters. Nothing, it was found, could break the resolution of the people to adhere to their favourite modes of worship; on the contrary, all these severe measures inspired a deep resentment against the government, as well as the prelates. On the 2d of May 1679, as Archbishop Sharpe was going in his coach to St Andrews, he was beset by a body of desperate men, among whom were Balfour of Burleigh, and Hackstoun of Rathillet, who cruelly slew him. An insurrection of the west country conventicles immediately followed, and a party of dragoons sent against them, under Captain Graham of Claverhouse, was gallantly repulsed at Loudon Hill. In a brief space, about 5000 men were found in arms against the state, among whom were many of the lesser gentry, the command being assumed by a gentleman named Hamilton. The rebellion was considered so formidable, that the Duke of Monmouth was sent down to head the troops for its suppression. He found them posted advantageously at Bothwell Bridge (June 22); but divisions on certain religious and political points unfitted them for making a good resistance. After defending the bridge for a while, they turned in a panic, and fled. Three hundred were killed in the pursuit, and 1200 taken prisoners.

This unfortunate insurrection, being followed up by fresh severities, effectually subdued all disposition to resistance, except in a small party of the Nonconformists, whose principles were of an unusually enthusiastic kind. Twenty armed men, professing these principles, were assailed by a detachment of dragoons in Airness (1680), when their leader Cameron, a clergyman, and several others, were killed, after a desperate resistance. Cargill, another preacher of this extreme sect, soon after held a conventicle at Torwood, near Stirling, where he formally excommunicated the king, his brother, and ministers. These proceedings had a highly injurious effect, in as far as they gave occasion for fresh severities against the whole party; but they originated in such pure and pious motives, and brought down such calamities upon the unshrinking heads of those concerned in them, that they have ever since been regarded in Scotland with great respect.

The more uncompromising party soon after arranged themselves into what they called a Secret Society, and

(12th January 1682) openly appeared at Lanark, where they published a declaration of their principles, among which a renunciation of all allegiance to Charles II. was the most remarkable. The dispute between the government and its subjects had now arrived at such an extremity, that individuals were shot in the fields by military law, if they merely refused to acknowledge the royal authority. The most of the people, unable or unwilling to resist, were therefore obliged to give an external reverence to the church established amongst them, or at least to the irregular clergy, who, by submissions odious to the community, had received what was called an *indulgence*, or permission to preach. A great disposition prevailed to emigrate to the American colonies, as the only means of escaping the oppressive restraints which prevailed at home.

THE KING BECOMES ABSOLUTE.

In the meantime, an extraordinary revolution took place in England. About the time that popular feeling was recovering from the mania respecting the Popish Plot, the House of Commons had shown stronger symptoms than ever of a determination to seek the exclusion of the Duke of York from the throne. The time was unfortunate, for men were beginning to suspect that they had been deceived in many of their surmises about danger from the Catholics. The object, moreover, touched upon a principle which many men in that age deemed sacred—that of hereditary succession; nor was it possible to blame the king for opposing a measure so unfavourable to the interests of his nearest blood relation. In fact, the Whig party pushed their favourite measure to such a point, as to cause a reaction of the public mind against their views.

The king called a new Parliament to meet at Oxford, resolved, in the event of its not proving more tractable, to take advantage of the popular feeling, dissolve the assembly, and never call another. It met on the 21st of March 1681, and the Whigs soon showed that the Exclusion Bill was still uppermost in their minds. The king permitted one of his ministers to propose, that at his death the Princess of Orange should reign as regent, and the new king be for ever banished five hundred miles from his dominions. To this concession, which now seems much greater than could have reasonably been expected, they would not listen for a moment. Charles then dissolved the Parliament as utterly intractable, and, as he expected, he was generally applauded for the act. Popular feeling had now taken a turn in favour of royalty; and the representative branch of the legislature, long regarded with veneration by the English, was once more permitted to go down without a struggle. The king henceforth ruled entirely without control, being secretly supplied with money by France, in consideration of his non-interference with the conquests of that country.

THE BZE-HOUSE PLOT—DEATH OF CHARLES II.

A fit of slaviahness now befell the English nation, as remarkable in its extent as the late fury against the court and the Catholics. Supported by this mood of the people, Charles caused all the corporations in the kingdom to give up their old charters, and accept of new ones, by which he became all-powerful over the elections of magistrates, and, consequently, over those of parliamentary representatives, should ever another election of that kind take place. The leaders of the late majority in Parliament, comprising the Duke of Monmouth, Lord Russell (son of the Earl of Bedford), the Earl of Essex, Lord Howard, the famous Algernon Sydney, and John Hampden, grandson of the patriot who first resisted Charles I., being reduced to absolute despair, formed a project for raising an insurrection in London, to be supported by one in the west of England, and another under the Earl of Argyll in Scotland, and the object of which should be confined to a melioration of the government. They were betrayed by an associate named Rumsay, and implicated, by a train of unfortunate circumstances, in a plot for assassinating

the king (styled the Rye-House Plot), of which they were perfectly innocent. By the execution of Russell and Sydney, and some other severities, the triumph of the king might be considered as completed. After having been an absolute sovereign for nearly four years, he died (February 6, 1685), professing himself at the last to be a Catholic, and was succeeded by the DUKE OF YORK.

Charles II. was a prince of a gay and cheerful disposition, and so noted a sayer of witty things, and so addicted to humorous amusements, that he was called 'the Merry Monarch.' His wit, shrewdness, and good-humour, form the best side of his character. On the other side, we find a deficiency of almost every active virtue and of all steady principle. He never allowed any duty of his station, or any claim upon his justice or clemency, to interfere with his own interests, or even to disturb him in his indolent and vicious pleasures. Neglecting his wife, who never had any children, he spent most of his time with his various mistresses, who openly lived at court, and were even received by the queen. Of these ladies, the most remarkable were Louisa Querouaille, whom he created Duchess of Portsmouth, and Barbara Villiers, whom he made Duchess of Cleveland. Six sons of the king by his mistresses were made dukes, and five of these were the progenitors of families in the English nobility.

During the reign of Charles II., the nation advanced considerably in the arts of navigation and commerce; and the manufactures of brass, glass, silk, hats, and paper, were established. The post-office, set up during the Commonwealth as a means of raising money, was advanced in this reign, and the penny-post was now begun in London by a private person. Roads were greatly improved, and stage-coach travelling was commenced, though not carried to any great extent. During this reign, tea, coffee, and chocolate, which have had a great effect in improving and softening manners, were first introduced. In 1660, the Royal Society was established in London, for the cultivation of natural science, mathematics, and all useful knowledge. The science of astronomy was greatly advanced by the investigations of Flamsteed and Halley. But the greatest contribution to science was made by Sir Isaac Newton, whose Principles of Natural Philosophy were published in 1683: in this work, the true theory of planetary motions was first explained, in reference to the principle of gravitation. Amongst the literary men of the period, the first place is to be assigned to John Milton, author of the 'Paradise Lost' and other poems: Samuel Butler shines as a humorous and satirical poet, and Edmund Waller as a lyricist. Amongst divines, the highest names connected with the church are those of Jeremy Taylor and Isaac Barrow; while the highest among the Nonconformists are those of Richard Baxter and John Bunyan. The theatre, which had been suppressed during the Commonwealth, was revived in this reign; but the drama exhibited less talent and more licentiousness than it did in the previous reigns. Female characters, which had formerly been acted by men, were now for the first time performed by females.

JAMES II.—EXPEDITION OF MONMOUTH.

Charles II., with all his faults, had conducted himself towards his subjects with so much personal cordiality, and had so well calculated his ground before making any aggressions upon popular liberty, that he might probably have pursued his arbitrary career for many years longer. But his brother James, though much more respectable as a man, more industrious, and more sincere, wanted entirely the easiness of carriage, pleasantry, and penetration, which were the grounds of the late king's popularity and success. He was, moreover, an avowed Catholic, and inspired by an ardent desire of reforming the nation back into that faith. He began his reign by declaring before the privy-council his intention to govern solely by the laws, and to maintain the existing church; and such was the confidence in his sincerity, that he soon became very popular. Addresses poured in upon him from all quarters, profess-

ing the most abject devotion to his person. The Parliament called by him voted an ample revenue, and expressed the greatest servility towards him in all things. The doctrines of passive obedience, and the divine right of the sovereign, were now openly preached. The university of Oxford promulgated an elaborate declaration of passive obedience to rulers, which they declared to be 'clear, absolute, and without any exception of any state or order of men.'

The remains of the Whig party still existed, though in exile, and there were some districts of the country where they were supposed to have considerable influence. The Duke of Monmouth and the Earl of Argyle (the latter of whom had been condemned to death in Scotland, for adding a qualification to the test-oath, but had escaped) met in Holland, and projected two separate invasions, for the purpose of expelling King James. The former soon after landed in the west of England with a small retinue, and quickly found himself at the head of 5000 persons, though irregularly armed. At several places he caused himself to be proclaimed king, which offended many of his principal adherents, as inconsistent with his previous engagements. Upon the whole, his conduct was not energetic enough for the management of such an enterprise. Being attacked by the king's troops near Bridgewater, his infantry fought with some spirit, but being deserted by the cavalry, and by the duke himself, were obliged to give way. Monmouth was taken and executed. Many of his followers were hanged without form of trial by the royal troops, and others were afterwards put to death, with hardly any more formality, by the celebrated Chief-Justice Jefferies, whom the king sent down with a commission to try the offenders. The butchery of several hundred men of low condition, who were unable of themselves to do any harm to the government, was looked upon as a most unjustifiable piece of cruelty, even if it had been legally done; and the principal blame was popularly ascribed to the king.

The Earl of Argyle sailed in May with a corresponding expedition, and landed in that part of the West Highlands which owned his authority. Unfortunately for him, the government had received warning, and seized all the gentlemen of his clan upon whom he had chiefly depended. He nevertheless raised between 2000 and 3000 men, and made a timid advance to Glasgow, in the expectation of being joined by the persecuted Presbyterians of that part of the country. Being surrounded on the march by various parties of troops, he dispersed his army, and sought to escape in disguise, but was taken, brought to Edinburgh, and executed. Thus terminated the last effort made by the Whig party to ameliorate the despotic sway of the Stuarts.

ARBITRARY MEASURES OF THE KING.

Encouraged by his successes, James conceived that he might safely begin the process of changing the established religion of the country. On the plea of his supremacy over the church, he took the liberty of dispensing with the test-oath in favour of some Catholic officers, and thus broke an act which was looked upon, under existing circumstances, as the chief safeguard of the Protestant faith. His Parliament, servile as it was in temporal matters, took the alarm at this spiritual danger, and gave the king so effectual a resistance that he resorted to a dissolution. Transactions precisely similar took place in Scotland.

Headless of these symptoms, he proclaimed a universal toleration, for the purpose of relieving the Catholics, and thus assumed the unconstitutional right of dispensing with acts of Parliament. The nation was thrown by this measure, and by the numerous promotions of Roman Catholics, into a state of great alarm; even the clergy, who had been so eager to preach an implicit obedience to the royal will, began to see that it might be productive of much danger. When James commanded that his proclamation of toleration should be read in every pulpit in the country, only two hundred of the clergy obeyed. Six of the bishops joined

in a respectful petition against the order; but the king declared that document to be a seditious libel, and threw the petitioners into the Tower. In June 1688, they were tried in Westminster Hall, and to the infinite joy of the nation, acquitted.

Blinded by religious zeal, the king proceeded on his fatal course. In defiance of the law, he held open intercourse with the Pope, for the restoration of Britain to the bosom of the Romish church. He called Catholic lords to the privy-council, and even placed some in the cabinet. Chapels, by his instigation, were everywhere built, and monks and priests went openly about his palace. A court of high commission—a cruel instrument of power under Charles I.—was erected, and before this every clerical person who gave any offence to the king was summoned. He also excited great indignation, by violently thrusting a Catholic upon Magdalen College, at Oxford, as its head, and expelling the members for their resistance to his will. Public feeling was wound to the highest pitch of excitement by the queen being delivered (June 10, 1688) of a son, who might be expected to perpetuate the Catholic religion in the country, and whom many even went the length of suspecting to be a supposititious child, brought forward solely for that purpose.

The disaffection produced by these circumstances extended to every class of the king's subjects, except the small body of Roman Catholics, many of whom could not help regarding the royal measures as imprudent. The Tories were enraged at the ruin threatened to the church of England, which they regarded as the grand support of conservative principles in the empire. The Whigs, who had already made many strenuous efforts to exclude or expel the king, were now more inflamed against him than ever. The clergy, a popular and influential body, were indignant at the injuries inflicted upon their church; and even the dissenters, though comprehended in the general toleration, saw too clearly through its motive, and were too well convinced of the illegality of its manner, and of the danger of its object, as affecting the Protestant faith, to be exempted from the general sentiment. But for the birth of the Prince of Wales, the people at large might have been contented to wait for the relief which was to be expected, after the death of the king, from the succession of the Princess of Orange, who was a Protestant, and united to the chief military defender of that interest in Europe. But this hope was now shut out, and it was necessary to resolve upon some decisive measures for the safety of the national religion.

THE REVOLUTION.

In this crisis, some of the principal nobility and gentry, with a few clergymen, united in a secret address to the Prince of Orange, calling upon him to come over with an armed force, and aid them in protecting their faith and liberties. This prince, who feared that England would soon be joined to France against the few remaining Protestant powers, and also that his prospects of the succession in that country, as nephew and son-in-law of the king,\* were endangered, listened readily to this call, and immediately collected a large fleet and army, comprising many individuals, natives of both Scotland and England, who had fled from the severe government of the Stuart princes. The preparations for the expedition were conducted with great secrecy, and James was partly blinded to them, by a rumour that their only object was to frighten him into a closer connection with France, in order to make him odious to his subjects. When he was at length assured by his minister in Holland that he might immediately expect a formidable invasion, he grew pale, and dropped the letter from his hands. He immediately ordered a fleet and large army to be collected, and that he might retain the affections of his subjects, he called a parlia-

\* The mother of the prince was Mary Stuart, eldest daughter of Charles I., and sister of James II. Falling the infant Prince of Wales, his own wife, and the Princess Anne, the two daughters of the king, he was the heir of the British crown.

ment, and undid many of his late measures. The people justly suspected his concessions to be insincere, and were confirmed in their belief, when, on a rumour of the Prince of Orange being put back by a storm, he recalled the writs for assembling Parliament.

On the 19th of October, the Prince of Orange set sail with 50 ships of war, 25 frigates, 25 fire-ships, and 500 transports, containing 15,000 land troops. A storm occasioned some damage and delay; but he soon put to sea again, and proceeded with a fair wind along the British Channel, exhibiting from his own vessel a flag, on which were inscribed the words, 'THE PROTESTANT RELIGION AND THE LIBERTIES OF ENGLAND,' with the apposite motto of his family, '*Je Maintiendrai*.'—'I will maintain.' As he passed between Dover and Calais, his armament was visible to crowds of spectators on both shores, whose feelings were much excited at once by its appearance and its well-known purpose. The English fleet being detained at Harwich by the same wind which was so favourable to the prince, he landed (November 5) without opposition at Torbay, and immediately proceeded to circulate a manifesto, declaring the grievances of the kingdom, and promising, with the support of the people, to redress them.

At the first there seemed some reason to fear that the prince would not meet with adequate support. On his march to Exeter, and for eight days after arriving there, he was not joined by any person of consequence. The nation, however, soon became alive to the necessity of giving him encouragement. The gentry of Devon and Somersetshires formed an association in his behalf. The Earls of Bedford and Abingdon, with other persons of distinction, repaired to his quarters at Exeter. Lord Delamere took arms in Cheshire; the city of York was seized by the Earl of Danby; the Earl of Bath, governor of Plymouth, declared for the prince; and the Earl of Devonshire made a like declaration in Derby. Every day discovered some new instance of that general confederacy into which the nation had entered against the measures of the king. But the most dangerous symptom, and that which rendered his affairs desperate, was the spirit which he found to prevail in his army. On his advancing at its head to Salisbury, he learned that some of the principal officers had gone over to the Prince of Orange. Lord Churchill (afterwards famous as Duke of Marlborough), Lord Trelawney, and the king's son-in-law, George, Prince of Denmark, successively followed this example. Even his daughter, the Princess Anne, deserted him. In great perplexity, he summoned a council of peers, by whose advice writs were issued for a new Parliament, and commissioners despatched to treat with the prince. A kind of infatuation now took possession of the king; and having sent the queen and infant prince privately to France, he quitted the capital at midnight, almost unattended, for the purpose of following them, leaving orders to recall the writs and disband the army. By this procedure, the peace of the country was imminently endangered; but it only served to hasten the complete triumph of the Prince of Orange, who had now advanced to Windsor. The supreme authority seemed on the point of falling into his hands, when, to his great disappointment, the king, having been discovered at Feverham, in Kent, was brought back to London, not without some marks of popular sympathy and affection. There was no alternative but to request the unfortunate monarch to retire to a country-house, where he might await the settlement of affairs. James, finding his palaces taken possession of by Dutch guards, and dreading assassination, took the opportunity to renew his attempt to leave the kingdom. He proceeded on board a vessel in the Medway, and after some obstructions, arrived safely in France, where Louis readily afforded him an asylum.

The same day that the king left Whitehall for the last time, his nephew and son-in-law arrived at St James's. The public bodies immediately waited on him, to express their zeal for his cause; and such of the members of the late Parliaments as happened to be in town, having met by his invitation, requested him to

issue writes for a convention, in order to settle the nation. He was in the same manner, and for the same purpose, requested to call a convention in Scotland. The English convention met on the 22d of January 1689, and during its debates the prince maintained a magnanimous silence and neutrality. The Tory party, though it had joined in calling him over, displayed some scruples respecting the alteration of the succession, and seemed at first inclined to settle the crown on the princess, while William should have only the office of regent; but when this was mentioned to the prince, he calmly replied, that in that event, he should immediately return to Holland. A bill was then passed, declaring that 'James II., having endeavoured to subvert the constitution, by breaking the *original contract* between the king and people, and having withdrawn himself from the kingdom, has *abdicated* the government; and that the throne is thereby become *vacant*.' To the bill was added what was called a *Declaration of Rights*—namely, an enumeration of the various laws by which the royal prerogative and the popular liberties had formerly been settled, but which had been violated and evaded by the Stuart sovereigns. WILLIAM and MARY, having expressed their willingness to ratify this declaration, were proclaimed king and queen jointly—the administration to rest in William; and the convention was then converted into a Parliament.

In Scotland, where the Presbyterians had resumed an ascendancy, the convention came to a less timid decision. It declared that James, by the abuse of his power, had *forfeited* all right to the crown—a decision also affecting his posterity; and William and Mary were immediately after proclaimed. By a bill passed in the English Parliament, the succession was settled upon the survivor of the existing royal pair; next upon the Princess Anne and her children; and finally, upon the children of William by any other consort—an arrangement in which no hereditary principle was overlooked, except that which would have given a preference to James and his infant son.

By the Revolution, as this great event was styled, it might be considered as finally decided that the monarchy was not a divine institution, superior to human challenge, as the late kings had represented it, but one dependent on the people, and established and maintained for their benefit. Many advantages, of smaller importance, though of more direct and practical utility, resulted from the change. The Episcopal church, which in Scotland had occasioned incessant discontent and disturbance for the last twenty-eight years, was abolished in that kingdom, and the favourite Presbyterian forms were established, to the almost universal satisfaction of the nation. By an act passed in the English Parliament, the dissenters from the church in England were freed from the severities to which they had been exposed during the last two reigns. The royal revenue, which had formerly been fixed at the beginning of each reign, was now settled annually by the House of Commons, so that the king was more under the control of his people than formerly. The independence and impartiality of the judges were now secured by their being appointed for life, or during good behaviour, instead of being removable at the royal pleasure as heretofore. William is said to have wished to grant some further concessions in favour of the Dissenters, but was prevented by the powerful opposition which the Tory party presented in Parliament.

#### RESISTANCE IN SCOTLAND AND IRELAND.

The new government was at first extremely popular in Scotland; but one portion of the people was much opposed to it. This consisted of the Highland clans—a primitive race, unable to appreciate the rights which had been gained, prepossessed in favour of direct hereditary succession, and of such warlike habits, that though a minority, they were able to give no small trouble to the peaceful Lowlanders. When the Scottish convention was about to settle the crown on William and Mary, Viscount Dundee, formerly Graham of

Claverhouse, and celebrated for his severity upon the recusant Presbyterians, raised an insurrection in the Highlands in favour of King James, while the Duke of Gordon, a Catholic, still held out Edinburgh Castle in the same interest. It was with no small difficulty that the new government could obtain the means of reducing these opponents. The castle, after a protracted siege, was given up in June (1689). General Mackay was despatched by William, with a few troops, to join with such forces as he could obtain in Scotland, and endeavour to suppress the insurrection in the Highlands. He encountered Dundee at Killiecrankie (July 27), and, though his troops were greatly superior in number and discipline, experienced a complete defeat. Dundee, however, fell by a musket-shot in the moment of victory, and his army was unable to follow up its advantage. In a short time the Highland clans were induced to yield a nominal obedience to William and Mary.

In Ireland, a much more formidable resistance was offered to the revolution settlement. Since the accession of James, the Romish faith might be described as virtually predominant in that kingdom. The laws against Catholics had been suspended by the royal authority, all public offices were filled by them, and though the established clergy were not deprived of their benefices, very little tithe was paid to them. The viceregal office was held by the Earl of Tyrconnel, a violent and ambitious young man, disposed to second the king in all his imprudent measures, and resolved, in the event of their failing, to throw the country into the hands of the French. The people at large being chiefly Catholics, were warmly attached to the late sovereign, whose cause they regarded as their own.

Early in the spring of 1689, James proceeded from France to Ireland, where he was soon at the head of a large though ill-disciplined army. He immediately ratified an act of the Irish Parliament for annulling that settlement of the Protestants upon the lands of Catholics, which had taken place in the time of Cromwell, and another for attainting 2000 persons of the Protestant faith. The Protestants, finding themselves thus dispossessed of what they considered their property, and exposed to the vengeance of a majority over whom they had long ruled, fled to Londonderry, Inniskillen, and other fortified towns, where they made a desperate resistance, in the hope of being speedily succoured by King William. That sovereign now led over a large army to Ireland, and (July 1) attacked the native forces under his father-in-law at the fords of the river Boyne, near the village of Dunore, where he gained a complete victory.

James was needlessly dispirited by this disaster, and lost no time in sailing again to France. In reality, the Irish made a better appearance, and fought more vigorously, after the battle of the Boyne than before it. The Duke of Berwick, a natural son of James, and the Earl of Tyrconnel, still kept the field with a large body of cavalry, and the infantry were in the meantime effectually protected in the town of Limerick. William invested this town, and in one assault upon it lost 2000 men, which so disheartened him, that he went back to England, leaving his officers to prosecute the war. The Irish army afterwards fought a regular battle at Aghrim, when, partly owing to the loss of their brave leader, St Ruth, they were totally routed. The remains of the Catholic forces took refuge in Limerick, where they finally submitted in terms of a treaty which seemed to secure the Catholic population in all desirable rights and privileges. It was agreed that they should receive a general pardon; that their estates should be restored, their attainders annulled, and their outlawries reversed; that Roman Catholics should enjoy the same toleration as in the days of Charles II., and not be disturbed in the exercise of their religion; that they should be restored to all the privileges of subjects, on simply swearing allegiance to the king and queen; and that such as chose to follow the fortunes of James (of whom there was a vast number), should be conveyed to the continent at the expense of government.

King William, whose disposition was tolerant, promised to procure a ratification of this treaty by Parliament, but he was thwarted in his design. An act was passed in England making it necessary for all members of the Irish Parliament, and all persons filling civil, military, and ecclesiastical offices in Ireland, to take an oath abjuring the most important doctrines of the Catholic faith. After this had taken effect, in the filling of the Irish Parliament with Protestants, an act was passed by that assembly, professing to be a confirmation of the treaty of Limerick, but in reality putting the Catholics into a worse condition than before.

## REIGN OF WILLIAM III.

Though all military opposition was thus overcome, William soon found difficulties of another kind in the management of the state. The Tories, though glad to save the established church by calling in his interference, had submitted with no good grace to the necessity of making him king; and no sooner was the danger past, than their usual principles of hereditary right were in a great measure revived. From the name of the exiled monarch, they now began to be known by the appellation of *Jacobites*. James's hopes of a restoration were thus for a long time kept alive, and the peace of William's mind was so much embittered, as to make his sovereignty appear a dear purchase. Perhaps the only circumstance which reconciled the king to his situation, was the great additional force he could now bring against the ambitious designs of Louis XIV. Almost from his accession he entered heartily into the combination of European powers for checking this warlike prince, and conducted military operations against him every summer in person. The necessity of having supplies for that purpose rendered him unfit, even if he had been willing, to resist any liberal measures proposed to him in Parliament, and hence his passing of the famous Triennial Act in 1694, by which it was appointed that a new Parliament should be called every third year. In this year died Queen Mary, without offspring; after which William reigned as sole monarch.

While William was treated in England with less than justice, he lost all his popularity in Scotland, in consequence of two separate acts, characterised by great cruelty and injustice. An order had been issued, commanding all the Highland chiefs, under pain of fire and sword, to give in their submission before the last day of the year 1691. One individual—Macdonald of Glencoe—was prevented by accident from observing the day, and letters of fire and sword, signed by the king, were accordingly issued against him. The military party intrusted with this duty, instead of boldly advancing to the task, came among the clan as friends, partook of their hospitality and amusements, and never indicated their intentions till the morning of the 13th of February (1692), when they attacked the unsuspecting people in their beds, and mercilessly slew all that came in their way. Thirty-eight persons, including the chief and his wife, were slaughtered, and many others died in the snow, as they vainly tried to escape. A more atrocious action does not stain modern history, though the barbarous circumstances of the slaughter were more owing to feelings of private revenge on the part of some of the officials of government in Scotland, than to the intentions of William.

Two or three years after, the Scottish people began to turn their attention to commerce, by which they saw great advantages gained by neighbouring states, and they planned a colony on the Isthmus of Darien, which they thought might become an emporium for American and Indian produce. They subscribed among themselves for this purpose no less than £400,000; to which was added more than as much again by merchants in London and Holland. The jealousy of other trading companies, and the remonstrances of the Spaniards, who apprehended some interference with their colonies, induced the king to withdraw his countenance from the scheme, after he had sanctioned it by act of Parliament; but, nevertheless (1698), a gallant expedition was sent

out by the Scots, who founded a town called New Edinburgh, about midway between Portobello and Carthage, and under the ninth degree of latitude. During the winter months, everything seemed likely to answer the expectations of the colonists; but summer brought disease, and on their provisions running low, they found, to their infinite consternation, that they could get no supplies, the Spanish and British colonists of the neighbouring countries being forbidden to deal with them. In May and September 1699, ere intelligence of these circumstances could reach home, two other expeditions had sailed, containing 1800 men, who were involved on their arrival in the same disasters. After disease had swept off many hundreds, the remainder were attacked by the Spaniards, who pretended a right to the country; and to these haughty enemies, who were countenanced in their proceedings by the British sovereign, the unfortunate colony was obliged to surrender. Very few ever regained their native country, and the large sums vested in the undertaking were irrecoverably lost. The massacre of Glencoe, and the Darien expedition, excited feelings of the most intense bitterness against the king in the breasts of the Scottish nation, among whom the Jacobite party thenceforward began to assume a formidable appearance.

The peace of Ryswick, concluded in 1697, by which the French power was confined to due limits, permitted William to spend the concluding years of his reign in peace. In 1700, in consideration that he and his sister-in-law Anne had no children, the famous Act of Succession was passed, by which the crown, falling these two individuals, was settled upon the next Protestant heir, Sophia, Duchess of Hanover, daughter of Elizabeth, the eldest daughter of James I.

About this time the causes of a new war took their rise in certain disputes respecting the succession to the crown of Spain. The title to that sovereignty, in the event of the death of the existing king without heirs, was claimed by the king of France, the elector of Bavaria, and the emperor of Germany, through various female lines of descent. A treaty, to which England was a party, was entered into for preventing the whole from falling into the hands of the reigning family of France, whose possessions would then have been so great as to be inconsistent, it was thought, with the independence and safety of the neighbouring states. At the death of the king of Spain, a will was produced, in which it appeared that he had appointed the Duke of Anjou, second son of the dauphin, to be his successor. The French king lost no time in enforcing the pretensions of his grandson, who, under the title of Philip V., became the founder of the Bourbon dynasty in Spain.

About the same time (September 1701) James, the exiled English king, died at St Germain, leaving his pretensions to his son, James, Prince of Wales, now a boy of thirteen years of age, and henceforth generally recognised in Britain by the epithet of the *Pretender*. Without regard to the treaty of Ryswick, Louis XIV. acknowledged this young person as JAMES III., King of Great Britain, by which he added greatly to the hostile feeling which his other proceedings had already created in the British king and people. A war was accordingly in preparation, when King William died (March 2, 1702), in consequence of a fall from his horse.

William was a prince of commanding ability, particularly in military affairs. His ruling sentiment was a wish to reduce the power of the king of France, which he was able in no small degree to effect. His person was thin and feeble, and his ordinary demeanour was reputed cold, silent, and somewhat repulsive. It was only in battle that he ever became animated or easy. He was a conscientious man, of sober and even kindly domestic habits, and sincerely attached to toleration in religion. But for the questionable act of expelling his uncle and father-in-law from the throne, and his concern in the affairs of Glencoe and Darien, no serious blot of any kind would have rested upon his name, either as a public or private person.

The reign of King William is remarkable for the

first legal support of a standing army, and for the commencement of the national debt. It is also distinguished by the first establishment of regular banks for the deposit of money, and the issue of a paper currency. Formerly, the business of banking, as far as necessary, was transacted by goldsmiths, or through the medium of the public Exchequer, by which plans the public was not sufficiently insured against loss. In 1695, the first public establishment for the purpose, *the Bank of England*, was established by one William Paterson, a scheming Scotsman; and next year the Bank of Scotland was set on foot by one Holland, an English merchant. The capital in the former case being only £1,200,000, and in the latter the tenth part of that sum.

In the reign of King William flourished Sir William Temple, an eminent political and philosophical writer, to whom is usually assigned the honour of first composing the English language in the fluent and measured manner which afterwards became general. The most profound philosophical writer of the age was John Locke, author of an *Essay on the Human Understanding*, an *Essay on Toleration*, and other works. Bishop Tillotson stands high as a writer of elegant sermons. The greatest name in polite literature is that of John Dryden, remarkable for his energetic style of poetry, and his translations of Virgil and Juvenal.

QUEEN ANNE—MARLBOROUGH'S CAMPAIGNS.

William was succeeded by his sister-in-law, ANNE, second daughter of the late James II.; a princess now thirty-eight years of age, and chiefly remarkable for her zealous attachment to the church of England. The movement against the king of France had not been confined to Great Britain; it was a combination of that power with the emperor of Germany and the states of Holland. Queen Anne found it necessary to maintain her place in the Grand Alliance, as it was termed; and the Duke of Marlborough was sent over to the continent with a large army to prosecute the war in conjunction with the allies. Now commenced that career of military glory which has rendered the reign of Anne and the name of Marlborough so famous. In Germany and Flanders, under this commander, the British army gained some signal successes, particularly those of Blenheim and Ramillies; in Spain, a smaller army, under the chivalrously brave Earl of Peterborough, performed other services of an important kind. The war, however, was one in which Britain had no real interest—for it has been seen that Spain has continued under a branch of the House of Bourbon without greatly endangering other states.

A party, consisting chiefly of Tories, endeavoured, in 1706, to put an end to the war; and France was so much reduced in strength, as to concede all the objects for which the contest had been commenced. But the people were so strongly inspired with a desire of humiliating France, which in commerce and religion they considered their natural enemy, that some ambitious statesmen of a contrary line of politics were enabled to mar the design of a treaty. Among these was the Duke of Marlborough, who, being permitted to profit not only by his pay, but by perquisites attached to his command, wished the war to be protracted, merely that he might make his enormous wealth a little greater. It was in consequence of these unnecessary interferences with continental politics, urged chiefly by the people, and by a class of statesmen popular at the time, that the first large sums of the national debt were contracted.

UNION OF ENGLAND AND SCOTLAND.

Since their religious enthusiasm had been laid at rest by the Revolution Settlement, the Scottish people had been chiefly animated by a desire of participating in the commerce of England. The treatment of their expedition to Darien had now inspired them with a bitter feeling against their southern neighbours, and they resolved to show their power of counter-annoyance

by holding up threats of dissenting from England in the matter of the succession. In 1703, their Parliament passed the famous *Act of Security*, by which it was ordained that the successor of her majesty in Scotland should not be the same with the individual adopted by the English Parliament, unless there should be a free communication of trade between the countries, and the affairs of Scotland thoroughly secured from English influence. Another act was at the same time passed for putting the nation under arms. The English ministers then saw that an incorporating union would be necessary to prevent the Pretender from gaining the Scottish crown, and to protect England from the attacks of a hostile nation. For this purpose they exerted themselves so effectually in the Scottish Parliament, as to obtain an act, enabling the queen to nominate commissioners for the arrangement of a union. The men appointed, thirty on each side, were, with hardly an exception, the friends of the court and of the Revolution Settlement; and the treaty accordingly was drawn up without difficulty.

In October 1706, this document was submitted to the Scottish Parliament, and was found to contain the following principal points:—That the two nations were to be indissolubly united under one government and legislature, each, however, retaining its own civil and criminal law; the crown to be in the House of Hanover; the Scottish Presbyterian church to be guaranteed; forty-five members to be sent by the Scottish counties and burghs to the House of Commons, and sixteen elective peers to be sent to the Upper House by the nobles; the taxes to be equalised, but, in consideration of the elevation of the Scotch imposts to the level of the English (for the latter people already owed sixteen millions), an equivalent was to be given to Scotland, amounting to nearly four hundred thousand pounds, which was to aid in renewing the coin, and other objects. These terms were regarded in Scotland as miserably inadequate; and the very idea of the loss of an independent legislature and a place among governments, raised their utmost indignation. Nevertheless, by dint of bribery, the union was carried through Parliament; and from the 1st of May 1707, the two countries formed one state, under the title of the Kingdom of Great Britain.

HIGH CHURCH ENTHUSIASM.

Since the Revolution, the Whigs might be considered as the predominant party in England. They almost exclusively constituted the ministries, and a large majority in the Parliaments, of King William. The sentiments of the queen were of a different cast from theirs. She disrespected the Revolution Settlement, by which she reigned; and was more zealously attached than they to the church of England, in all its doctrines, practices, and privileges. As the remembrance of the errors of King James faded from the public recollection, or were put out of view by more recent grievances, the people began to partake more generally of the Tory spirit. The Parliament which they returned at the beginning of the new reign, contained a much larger admixture of that party than the former one. The Tory feeling of both people and Parliament chiefly took the direction of a strong attachment to the church of England, which they wished to maintain in uncompromising supremacy, and in all its privileges; while the Whig party, in general, were favourable to the toleration called for by the dissenters. The distinction of High Church and Low Church now became conspicuous, the one phrase implying the ecclesiastical views of the Tories, while the other referred to those of the Whigs. In this Parliament the House of Commons passed a bill against *occasional conformity*, by which penalties were imposed on all persons in office who should attend dissenting places of worship; but it was thrown out by the Upper House, in which the bishops created by William voted against it.

An imprudent act of the ministry raised the High Church enthusiasm to an extraordinary height. A

divine of inferior note, named Henry Sacheverell, had preached a violent sermon, in which he seemed to call upon the people to take up arms in defence of their endangered church. The ministers were so weak as to give this man a solemn trial, during which the people rose so tumultuously in his favour, that, though declared guilty, it was found impossible to inflict upon him more than a nominal punishment. After the trial, he received more marks of public reverence and honour than were ever bestowed on the greatest national benefactor. In proportion to the popularity of Dr Sacheverell, was the loss of public favour experienced by the Whig party. About the same time, through some court intrigues, they forfeited all remaining favour with their royal mistress. Mrs Masham, a lady of the court, and favourite of the queen, had contrived to introduce into the cabinet two Tory statesmen, Mr Robert Harley, afterwards Earl of Oxford, and Mr Henry St John, afterwards Lord Bolingbroke. These gentlemen having attempted to set up a party for themselves, their superior, Lord Godolphin, dismissed them, to the great displeasure of Queen Anne, who now resolved to get quit of the Whig party at the first opportunity. In August 1710, Harley and St John came into power, at the head of a decidedly Tory ministry, which, though of brief duration, was destined to make an important figure in the national history. The queen at the same time called a new Parliament, which proved to be almost wholly composed of the Tory party.

PEACE OF UTRECHT—DEATH OF QUEEN ANNE.

The members of the new cabinet immediately applied themselves, though very secretly, to the business of bringing about a peace. When their plans were matured, the consent of the House of Commons was easily gained; but the Lords having shown some reluctance, it was found necessary to create twelve new peers, in order to overpower the sense of that part of the legislature. After a tedious course of negotiation, Britain and Holland concluded a peace at Utrecht (1713), leaving the emperor of Germany still at war. By this arrangement, Philip V. was permitted to retain Spain and the Indies, but no other part of the dominions which his ambitious grandfather had endeavoured to secure for him; and it was provided that he and his descendants should never inherit the kingdom of France, nor any future king of France accede to the crown of Spain. Britain obtained nothing tangible by all her exertions, except the possession of Gibraltar and Minorca, and the privilege of being exclusively employed to carry slaves to the Spanish American colonies. It has justly been considered a stain upon the nation, that it should have concluded a separate peace under such clandestine circumstances, as the interests of the other belligerent parties were thereby greatly injured. For the gratification of their High Church supporters, the ministers obtained an act for preventing dissenters from keeping schools, and another for establishing church patronage in Scotland, the former of which was repealed in the following reign.

It is believed that Queen Anne and her Tory ministers were in secret willing to promote the restoration of the main line of the Stuart family, and Harley and St John are now known to have intrigued for that purpose. But before any plan could be formed, the queen took suddenly ill and died (August 1, 1714), when the ministers had no alternative but to proceed according to the Act of Settlement. The Electress Sophia being recently dead, her son, the elector, was proclaimed under the title of GEORGE I.

The reign of Queen Anne is not more distinguished by the wonderful series of victories gained by Marlborough, than by the brilliant list of literary men who now flourished, and who have caused this to be styled the Augustan age of English literature, as resembling that of the Roman Emperor Augustus. Alexander Pope stands unrivalled in polished verse on moral subjects. Jonathan Swift is a miscellaneous writer of singular vigour and an extraordinary kind of humour.

Joseph Addison wrote on familiar life and on moral and critical subjects with a degree of elegance before unknown. Sir Richard Steele was a lively writer of miscellaneous essays. This last author, with assistance from Addison and others, set on foot the 'Tatler,' 'Spectator,' and 'Guardian,' the earliest examples of small periodical papers in England, and which continue to this day to be regarded as standard works. Cibber, Congreve, Vanburgh, and Farquhar, were distinguished writers of comedy; and Prior, Philips, and Rowe, were pleasing poets. In graver literature, this age is not less eminent. Dr Berkeley shines as a metaphysician; Drs Sherlock, Atterbury, and Clark as divines; and Bentley as a critic of the Roman classics.

ACCESSION OF THE HOUSE OF HANOVER—REBELLION OF 1715-16.

The new sovereign lost no time in coming over to Britain, and fixing himself in that heritage which his family has ever since retained. He was fifty-four years of age, of a good, though not brilliant understanding, and very firm in his principles. Knowing well that the Whigs were his only true friends, he at once called them into the administration. It was the custom of that period for every party, on getting into power, to try to annihilate their opponents. Not only were the whole Tory party insulted by the king, but a committee of the House of Commons was appointed to prepare articles of impeachment against Oxford, Bolingbroke, the Duke of Ormond, and the Earl of Strafford. Bolingbroke, perceiving his life to be in danger, fled to the continent; and his attainder was in consequence moved and carried by his rival Walpole. Ormond suffered a similar fate. Oxford, after a protracted trial, was only saved in consequence of a difference between the Lords and Commons.

During the first year of King George, the Tories kept up very threatening popular disturbances in favour of High Church principles; but the Whigs, gaining a majority in the new House of Commons, were able to check this a little by the celebrated enactment called the *Riot Act*, which permits military force to be used in dispersing a crowd, after a certain space of time has been allowed. Disappointed in their hopes of office and power, and stung by the treatment of their leaders, the Tories resolved to attempt bringing in the Pretender by force of arms. With an eager hopefulness, which for a long time was characteristic of the party, they believed that all England and Scotland were ready to take up arms for the Pretender, when in reality there was but a limited portion of the people so inclined, and that portion unwilling to move if they saw the least risk or danger. Blind to these circumstances, and without design or concert, they commenced the unfortunate civil war of 1715.

The Earl of Mar, who had been a secretary of state in the late administration, raised his standard in Braemar (September 6), without any commission from the Pretender, and was soon joined by Highland clans to the amount of 10,000 men, who rendered him master of all Scotland north of the Forth. There, however, he weakly permitted himself to be cooped up by the Duke of Argyle, who, with a far less numerous force, had posted himself at Stirling. Mar expected to be supported by an invasion of England by the Duke of Ormond, and a rising of the people of that country. But the duke completely failed in his design, and no rising took place, except in Northumberland. There Mr Foster, one of the members of Parliament for the county, and the Earl of Derwentwater, with some other noblemen, appeared in arms, but unsupported by any considerable portion of the people. Mar detached a party of 1800 foot, under Mackintosh of Borlum, to join the Northumbrian insurgents, who complained that they had no infantry. The junction was managed with great address; and at the same time some noblemen and gentlemen of the south of Scotland attached themselves to the southern army. The government was ill provided with troops; but it nevertheless sent

such a force against Mr Foster, as obliged him to retire with his men into the town of Preston, in Lancashire, where, after an obstinate defence, the whole party (November 13) surrendered themselves prisoners at the king's mercy. On the same day, the Earl of Mar met the Duke of Argyle at Sheriffmuir, near Dumblane, where a battle was fought, in which, after the manner of the battles in the civil war, the right wing of each army was successful, but neither altogether victorious. The duke withdrew in the face of his enemy to Stirling, and the earl retired to Perth, resolved to wait for the news of an invasion from France, and for the arrival of the Pretender, whom he had invited to Scotland.

Mar did not for some time become aware how little reason he had to expect support from France. Louis XIV., upon whom the hopes of the party greatly rested, had died in September, leaving the government to the Regent Orleans, who had strong personal reasons for wishing to cultivate the good-will of the British monarch, and of course declined to assist in the present enterprise. The Pretender, nevertheless, sailed for Scotland, and on the 22d of December, arrived incognito at Peterhead, bringing nothing but his own person to aid his adherents. Mar, who had already attempted to negotiate a submission to the government, brought him forward to Perth, where he was amused for some time with preparations for his coronation. But before he had been many days there, the Duke of Argyle found himself in a condition to advance against the insurgent force; and on the 30th of January 1716, this unfortunate prince commenced a retreat to the north, along with his dispirited army. On the 4th of February, he and the Earl of Mar provided for their own safety by going on board a vessel at Montrose, and setting sail for France: the army dispersed itself into the Highlands. For this unhappy appearance in arms, the Earl of Derwentwater, Viscount Kenmure, and about twenty inferior persons, were executed; forty Scottish families of the first rank lost their estates, and many excellent members of society became exiles for the remainder of their lives.

CHARACTER OF THE GOVERNMENT UNDER GEORGE I.

The suppression of this insurrection, and the ruin of so many Tory leaders, tended to increase the power of the Whig party, and the stability of the Hanoverian dynasty. The government, nevertheless, acted under considerable difficulties, as they were opposed by the majority of the clergy and country gentry, as well as by the whole of the mob feeling, except in the large commercial towns. To avoid the hazard of too often appealing to the people, they carried, in 1716, a bill for repealing King William's Triennial Act, and protracting the present and all future Parliaments to a duration of seven years. The chief popular support of the government was in the dissenters, and the middle classes of the community.

From the peace of Utrecht, Britain remained free from foreign war for nearly thirty years, excepting that, in 1719, the ministry was called on to interfere for the repression of an attempt on the part of Spain to regain her Italian territories. A Scotsman, named Law, who had become comptroller-general of France, and amused that country with financial schemes, which at first promised to enrich, but finally almost ruined the country, was the means in 1720 of inspiring the British people with a similar visionary project, called the South Sea Scheme. This might be described as a joint-stock company, professedly trading in the South Seas, but chiefly engaged in a scheme for managing the national debt. It seemed for a time to prosper, and many realised large fortunes by selling their shares at a premium to others; but in a short time its unsoundness was discovered, the price of shares fell, and thousands were utterly ruined. With great difficulty, and by an extremely complicated adjustment, the House of Commons equalised as nearly as possible the state of gain and loss among the innocent parties, and

credit was restored. Sir Robert Walpole, who was chiefly concerned in effecting this arrangement, became premier and chancellor of the Exchequer, and for upwards of twenty years from that period (April 1721), he must be looked on as the prime mover and manager of the public affairs.

At the beginning of the reign of George I. the national debt amounted to fifty-three millions, and owing to there having been no war, it was rather less at the time of the king's death. The annual expenditure of the state was about seven millions, or scarcely a seventh part of what it now is. The commerce and manufactures of England continued to advance steadily during this reign; but Scotland and Ireland remained in an unimproved state. Roads were now for the first time made in the Highlands. The chief literary men were the same as those who had come into repute in the time of Queen Anne: in addition to them, John Gay is to be reckoned amongst the poets, and Waterland and Lardner amongst the divines. This was also more particularly the age of Daniel Defoe, a dexterous writer of pamphlets on the Nonconformist side, but far more noted in later times on account of his admirable tale of Robinson Crusoe.

GEORGE II.—WAR WITH SPAIN AND FRANCE.

George I., at his death in 1727, was succeeded by his son, GEORGE II., a prince of moderate abilities, but conscientious, and free from all gross faults. In the early part of his reign, Walpole effected some useful measures, and upon the whole was a vigorous and enlightened administrator of public affairs, though nothing can justify the extensive system of bribery by which alone he pretended to manage the House of Commons. After a peace of extraordinary duration, he was urged, much against his will, into a contest with Spain, on account of some efforts made by that country to check an illicit trade carried on by British merchants in its American colonies. In searching vessels for the prevention of this traffic, the Spaniards had made some trifling aggressions; and British spirit took fire at the indignity of being liable to a search by any neighbouring state, even for the prevention of a notorious breach of treaty. The community therefore demanded a war; and the minister, with great reluctance, was obliged to comply. One fleet, under Admiral Haddock, was sent to cruise off the coast of Spain; and another, under Admiral Vernon, was sent against the American colonies. The latter gained lustre by taking the important town of Portobello. Another and larger expedition, with 10,000 soldiers, was then sent to reinforce Vernon; but owing to disputes between him and the commander of the troops, no further triumphs were gained. A timid, ill-concerted, and ill-conducted attack on the fortifications of Carthagena, lost Britain a large body of men. Meantime, a third fleet, under Anson, sailed to the eastern coast of Spanish America, in order to co-operate with Vernon; but only one of the vessels reached its destination. Anson, thus reduced in naval force, took several prizes off Chili, and plundered the town of Païta, but could venture upon no more hazardous enterprise. He cruised across the Pacific in the hope of meeting one of the Spanish galleons, which usually contained great quantities of bullion; but did not succeed, till, on his return from refitting at Canton, he took the Manilla transport, with treasure to the amount of three hundred thousand pounds. Though he had failed in all the proper objects of his expedition, the money he brought to the public treasury caused him to be very well received by the people; while the flagrant mismanagement at Carthagena was the subject of general execration.

The Spanish war now languished for some time, while the attention of Britain was attracted to the proceedings of France. After the death of the Emperor Charles VI. of Germany, his dominions fell by inheritance to his daughter, the celebrated Maria Theresa, Queen of Hungary. She was opposed in this succession by the sovereigns of France, Saxony, and Bavaria, all of whom

pretended to have some claims on her dominions. A war was commenced against her; the elector of Bavaria was crowned emperor, under the title of Charles VII.; and such was the success of the French arms, that she was soon reduced to the greatest distress. With this quarrel Britain had little reason for interfering; but the king thought his dominions in Germany endangered, and the people were animated by their usual hostility to the French. Walpole, being conscientiously opposed to the war, allowed himself to be driven from office (February 1742), though he still continued to enjoy the respect of the king.

The ministry was recruited by the most popular men of the late minority, among whom the most conspicuous were Lord Carteret and the Earl of Bath. To the surprise of the nation, this set of statesmen opposed, now they were in power, all the improvements they had lately professed to clamour for, and seemed even more willing than their predecessors to carry out the policy which was suggested by the king's anxiety on account of his foreign dominions. About the time when Great Britain entered into this struggle, the affairs of the Hungarian queen took a surprising turn, and her armies, under her husband the Grand Duke of Tuscany, Prince Charles of Lorraine, and other eminent commanders, began to drive her enemies from her dominions. France, having lost 100,000 men in the contest, sued for peace; but this the queen haughtily refused, in the hope of gaining still greater triumphs by means of Britain. The aid of that power, as it turned out, was of little service to the queen. The Earl of Stair had permitted his army to get into a position of great difficulty at Aschaffenburg, on the Upper Main, and but for a blunder of the French, it would probably have been starved into a surrender, along with the king and prime minister (Carteret), both of whom had recently joined it. The blunder consisted in an attack made by the Duke of Grammont, with 30,000 troops, upon the British and Hanoverian infantry, upon a plain near the village of Dettingen (June 16, 1743). The infantry, cheered by the presence of the king, who rode between the lines with his sword drawn, received the charge of the French cavalry with great firmness, and compelled them to retreat—a movement which communicated a panic to the whole French army, and might have been attended with the most disastrous consequences, if the British monarch would have permitted his advantage to be followed up. This was the last occasion of a king of Great Britain appearing on the field of battle.

The death of the Emperor Charles VII., for whom this great European contest appeared to have taken its rise, might have now given an opportunity for the cessation of hostilities; but the French thought the war still necessary, in order to prevent the husband of Maria Theresa from being elected emperor, and the British were still animated by their usual antipathy to the French. A campaign was therefore opened in Flanders, the troops of the French nation being commanded by Count Saxe, distinguished for military genius and experience; while the British and Hanoverian army was under the charge of the young Duke of Cumberland, second son to the king. To animate the French troops, their sovereign (Louis XV.) and the dauphin attended the camp. The French having invested Tournay, it was resolved by the English to hazard a battle, in order to save that strong city.

The encounter took place (May 1745) at Fontenoy, near the bridge of Colonne. The British infantry advanced under Cumberland, and notwithstanding a tremendous fire, which swept them off in whole ranks, attacked the centre of the position of the French army, which they beat back in so furious a style, that Saxe advised the king to retire for the safety of his person. Louis bravely refused to stir, being apprehensive that a retrograde motion on his part would decide the day against his army. Ashamed to desert their sovereign, the French returned to the charge; the cavalry renewed their efforts, and other circumstances conspired to give a turn to the battle. The British cavalry were prevented

by a mistake from giving their support to the infantry; and the Dutch and Austrian part of the army was found totally ineffective. Assailed on all sides, fatigued with their great exertions, and galled by the French batteries, the infantry was obliged to retire with a loss of 7000 men, after having beaten every regiment in the French army. The Duke of Cumberland, though able to withdraw in good order, did not venture after this disaster to face the enemy during the whole campaign. Nevertheless, the queen of Hungary at this time gained the summit of her wishes, by the election of her husband to the imperial throne.

## REBELLION OF 1745-46.

The Pretender had married, in 1719, the Princess Clementina Sobieski of Poland, and was now the father of two sons in the bloom of youth, the elder of whom has been distinguished in history by the title of Prince Charles Stuart. The misfortunes of the British arms on the continent, and the dissensions which prevailed among the people and the Parliament, encouraged this prince to make an attempt to recover the throne of his ancestors. In 1744, he had been furnished by France with a large fleet and ample stores to invade the British dominions, but had been driven back by a storm, and prevented from again setting sail by a superior fleet under Sir John Norris. The object of France in this enterprise was to produce a diversion in favour of her own army in the Netherlands. At present, in consequence of the victory of Fontenoy, such an enterprise was no longer necessary; but though the French monarch would not grant him any further supply, Charles resolved to make the proposed attempt, trusting solely to the generosity and valour of his friends in Britain. He therefore landed from a single vessel, with only seven attendants, on the coast of Inverness-shire, where the clans most attached to his family chiefly resided. By merely working upon the ardent feelings of the Highland chiefs, he soon induced several of them to take up arms, among whom were Lochiel, Clanranald, Glengarry, and Keppoch.

On the 19th of August 1745 he raised his standard at Glenfinnan, within a few miles of the government station of Fort William, and found himself surrounded by about 1500 men. The government was at first inclined to disbelieve the intelligence of these proceedings, but was soon obliged to take steps for its own defence. A reward of thirty thousand pounds was offered for the head of the young prince, who, with all his family, was under attainder by act of Parliament; and Sir John Cope, commander of the forces in Scotland, was ordered to advance with what troops he had into the Highlands, and suppress the insurrection. Cope proceeded on this mission with about 1400 infantry; but on finding the Highlanders in possession of a strong post near Fort Augustus, he thought it necessary to go aside to Inverness. Charles, taking advantage of this ill-advised movement, immediately poured his motley followers down into the Lowlands, gaining accessions everywhere as he advanced; and there being no adequate force to oppose him, he took possession successively of Perth and Edinburgh.

Cope now transported his troops back to Lothian by sea, and on the 21st September, a rencontre took place between him and Charles at Prestonpans. Seized with a panic, the royal troops fled disgracefully from the field, leaving the prince a complete victory. With the lustre thus acquired by his arms, he might have now, with four or five thousand men, made a formidable inroad into England. Before he could collect such a force, six weeks passed away, and when at length (November 1) he entered England, a large body of troops had been collected to oppose him. After a bold advance to Derby, he was obliged by his friends to turn back. At Stirling he was joined by considerable reinforcements, and on the 17th of January 1746, a battle took place at Falkirk between him and General Hawley, each numbering about 8000 troops. Here Charles was again successful; but he was unable to make any use

of his victory, and soon after found it necessary to withdraw his forces to the neighbourhood of Inverness, where he spent the remainder of the winter. The Duke of Cumberland now put himself at the head of the royal troops, which had been augmented by 6000 auxiliaries under the Prince of Hesse. During the months of February and March, the Highland army was cooped up within its own territory, by the Hessians at Perth, and the royal troops at Aberdeen. At length, April 16, Prince Charles met the English army in an open moor at Culloden, near Inverness, and experienced a total overthrow. He had himself the greatest difficulty in escaping from the country, and the Highlands were subjected for several months to the horrors of military violence in all its worst forms.

To complete the subjugation of this primitive people, the hereditary jurisdictions under which they and the rest of the people of Scotland still lived, and by which the nobles and gentry were enabled to administer justice at their own discretion, were abolished by act of Parliament. Another act put an end to the tenure of ward-holdings, by which the land-proprietors were enabled to command the personal services, in peace and war, of those who lived on their estates. A third act prohibited the use of tartan and the ancient Highland fashion of clothes, which were supposed to have the effect of keeping alive the warlike spirit of the mountaineers. The two former of these measures, in connection with the suppression of the Stuart cause, and some other circumstances, produced a marked improvement in the social state of the Scottish people. The government, it must be remarked, had hitherto acted towards Scotland in a harsh and partial spirit. Suspected and hated by the ruling faction, the Highlanders had every temptation to continue in adherence to the exiled family. But when the government began to treat them in a milder spirit, and admitted them to the army and other branches of the public service, their naturally generous and loyal feelings were turned as zealously in favour of the new dynasty as they ever had been in favour of the old. The middle of the eighteenth century may be described as the time when Scotland, after a long period of indolence and poverty, first began to make advances towards that equality with England, in respect of comfort and prosperity, which it has since attained.

PEACE OF AIX-LA-CHAPELLE.

During the remainder of the war in which Britain and other powers were now engaged with France, the latter was generally successful by land, and unfortunate at sea, the contrary being the case with Britain. In 1748, the two countries found, after nine years of contention, that their losses were equal, though in different departments of their strength. Thirty millions had been added to the national debt of Britain, and France had expended an equal sum. They therefore agreed, by a treaty formed at Aix-la-Chapelle, mutually to restore their respective conquests, and to go back to exactly the same condition in which they stood before the war. A more signal illustration could have scarcely been held forth of the important truth—that war is to the parties in general only a means of waste and loss, and can be of no benefit to any man except at the expense of his neighbour.

COLONIES AND DEPENDENCIES OF BRITAIN—THE SEVEN YEARS' WAR.

For several years after this period the national resources underwent rapid improvement. The most respectable minister who immediately followed Walpole, was the Honourable Henry Pelham, first lord of the Treasury and chancellor of the Exchequer, whose commercial and financial schemes were usually very successful. Since the reign of Elizabeth, the British had been active in planting and rearing colonies, of which a considerable number now existed in the West Indies and in North America. The East India Company had also obtained large possessions in Hindoostan,

which proved the source of great wealth to Britain. The exclusive spirit in which Britain managed the commerce of those territories provoked the cupidity of the French, who commenced a system of aggression both in India and North America. They, in particular, drew a line of forts along the back settlements of the whole range of the American colonies, from the Gulf of St Lawrence to the Mississippi, so as to prevent the settlers from advancing beyond the Appalachian mountains.

For two or three years the British government suffered these aggressions, and even insults of a more decided nature, to pass unresented; but at length it was determined, in 1756, to proclaim war. A campaign of a novel and difficult character was opened in North America, for the purpose of driving the French from their forts. The first movements were attended with defeat and disaster. The French had gained the exclusive affection of the native Indians, who proved a dangerous and barbarous enemy to the British. Several of the forts were attacked, but without success; in the assault upon Ticonderago, 2000 men were killed. At length, on the accession of Mr William Pitt (afterwards Earl of Chatham) to the office of secretary of state, a more auspicious era commenced. The British troops and provincials became more experienced in the nature of the service. One after another, the principal forts fell into their hands; and a diversion was created by an attack upon Canada. In September 1759, General Wolfe reduced the town and fort of Quebec, though at the expense of his own life; and the whole colony soon after submitted to the British arms.

Meanwhile, Colonel Clive had been equally successful in the East Indies. He had destroyed the French settlement at Pondicherry, thereby securing to his country the whole coast of Coromandel; and by his famous victory at Plassey (June 26, 1756), over a combination of French and native forces, he laid the foundation of the great territorial power which the British have since acquired in Hindoostan. Thus the French, instead of gaining the colonies of other nations, ended by losing some of their own.

While Britain was thus successful in two remote quarters of the world, she experienced a different fortune in Europe. Austria, Russia, and Poland, had combined with France against the new and rising power of Prussia, which was at present directed by Frederick II., commonly called Frederick the Great. Britain on this occasion became the ally of the Prussian monarch, not from any regard to her own interests, but in order that the king might be able to protect his Hanoverian dominions. Immense sums of money were raised for the purpose of paying the troops of those countries which the king was anxious to defend; and the Duke of Cumberland was appointed their commander. This prince was so unfortunate (September 1757) as to bring an army of 40,000 men into an angular piece of country, from which there was no escaping, so that the whole were obliged to lay down their arms to the French, who then became masters of Hanover. Notwithstanding this failure on the part of his ally, Frederick was able, by his extraordinary military genius, and by British subsidies, to defend his dominions for several years against all the forces that Austria, France, and Russia, could bring against him. In the midst of this war (October 25, 1760), George II. died suddenly, in the seventy-seventh year of his age, and was succeeded by his grandson GEORGE III., then only in his twenty-third year.

MISCELLANEOUS CIRCUMSTANCES CONNECTED WITH THE REIGN OF GEORGE II.

The chief domestic event of the reign of George II. was the rise of the religious sect called Methodists. The church had for a considerable time been in a languid state; amongst the community there was little religious feeling of a fervid character; and at no previous time were there so many conspicuous writers against the main doctrines of Christianity. John Wesley, a clergyman of the established church, and several other indi-

viduals of an enthusiastic turn of mind, were prompted by these circumstances to attempt to rouse a more zealous piety amongst the people; and in this object they were surprisingly successful. Another clergyman named Whitefield, gifted with oratorical powers which gave him great command over the feelings of an audience, proved of much service as an itinerant preacher in working this reformation. The consequence of these exertions was the organisation of a new religious body, commonly called Methodists, comprehending a vast number of congregations in all parts of the kingdom, as well as in the American colonies.

Newspapers first acquired political importance in this reign. They originated in the time of the Commonwealth, but none of a regular periodical nature appeared till after the Restoration, when a busy writer named Roger L'Estrange established in London a weekly one called 'The Intelligencer.' Till the Revolution, such small and unimportant newspapers as existed, were trammelled by a licensing power and censorship. When these restrictions were removed, newspapers increased in number, till, in 1709, they were again restricted by the imposition of a penny stamp. In those days newspapers were chiefly conducted by a set of mean and poor writers, to whom the term 'Grub Street authors' was generally applied, from many of them living in that wretched part of London. The influence which newspapers were calculated to have over the public mind, was first recognised by Sir Robert Walpole, who, while he never thought of giving the least encouragement to literature on its own account, liberally pensioned various editors who supported his government. About the beginning of this reign there were in London one daily paper, fifteen three times a week, and one twice a week, besides a few country papers. A monthly pamphlet, begun in 1731 by Edward Cave, a London bookseller, under the name of the 'Gentleman's Magazine,' was composed of the best articles from the newspapers; and thus originated the periodical works termed magazines and reviews, which are now conspicuous as vehicles of light literature and political discussion.

The peculiar literary genius of the age was shown in the fictitious prose writings of Fielding, Smollett, and Sterne, and in the pictures of Hogarth, all of which represent the national character in its greatest breadth. The novels of Richardson are equally accurate as descriptions of manners, but contain no trace of the same humour. Next in distinction to these writings must be placed the essays of John Hawkesworth and Samuel Johnson, the latter of whom did a great service to literature in compiling a dictionary of the English language. James Thomson, William Collins, and Thomas Gray, rank high as poets. Carte and Echard were respectable historical writers; and philosophy was cultivated by Francis Hutcheson and David Hartley. Drs Conyers Middleton, Joseph Butler, and Isaac Watts, were the principal writers on religious subjects.

#### GEORGE III.—BUTE ADMINISTRATION—PEACE OF 1763.

Soon after his accession, George III. espoused the Princess Charlotte of Mecklenburg-Strelitz, by whom he had a large family. One of his earliest political measures was to confer one of the state-secretaryships upon the Earl of Bute, a Scottish nobleman of Tory or Jacobite predilections, who had been his preceptor, and possessed a great influence over his mind. This, with other alterations, infused a peaceful disposition into his majesty's counsels, which was not much relished by Mr Pitt. That minister, having secretly discovered that Spain was about to join France against Britain, and being thwarted in the line of policy which he consequently thought it necessary to assume, retired with a pension, and a peerage to his wife; after which the ministry was rendered still less of a warlike temper. A negotiation for peace was entered into with France, which offered, for that end, to give up almost all her colonial possessions. The demands of the British were, however, rather more exorbitant than France expected,

and not only was the treaty broken off, but Spain commenced those hostilities which Mr Pitt had foretold. Nevertheless, Britain continued that splendid career of conquest which, except at the beginning, had been her fortune during the whole of this war. In a very few months Spain lost Havana, Manilla, and all the Philippine Isles. The Spanish forces were also driven out of Portugal, which they had unjustly invaded. At sea the British fleets reigned everywhere triumphant, and at no former period was the country in so proud a situation. The ministry, however, were sensible that war, even with all this good fortune, was a losing game; and they therefore, much against the will of the nation, concluded a peace in February 1763.

By this treaty Great Britain gave up a certain portion of her conquests, in exchange for others which had been wrested from her; but she was nevertheless a gainer to an immense amount. She acquired from the French, Canada, that part of Louisiana east of the Mississippi, Cape Breton, Senegal, the islands of Grenada, Dominica, St Vincent's, and Tobago, with all the acquisitions which the French had made upon the Comorand coast in the East Indies since 1749. From Spain she acquired Minorca, East and West Florida, with certain privileges of value. The continental states in alliance with Great Britain were also left as they had been. These advantages on the part of Great Britain had been purchased at the expense of an addition of sixty millions to the national debt, which now amounted in all to £133,959,270.

#### TRANSACTIONS IN IRELAND.

Since the pacification at Limerick, Ireland had been ruled exclusively by the Protestant party, who, under the influence of feelings arising from local and religious antipathies, had visited the Catholics with many severities. These measures naturally rendered the Catholics discontented subjects, and led to much turbulence. The common people of that persuasion, being denied all access to justice, took it into their own hands, and acquired those lawless habits for which they have since been remarkable. Treachery, cruelty, and all the lower passions, were called into vigorous exercise. The passing of a bill in 1719 by the English Parliament, declaring its power to legislate for Ireland, occasioned general dissatisfaction, and caused the rise of a patriotic party in the Parliament and people of Ireland, who professed to look to the advantage of the country, as distinguished from that of Great Britain. The discontent of the Tory party mingled with this spirit; and the celebrated Swift, in 1724, blew it into a flame by his severe pamphlets, called the 'Drapier's Letters,' which professedly decried a new coinage of halfpence, but were in reality aimed at the English ministry.

The discontents of the Catholics continued unabated, and the contentions of the patriotic party with the adherents of the English ministry were carried on with the utmost keenness in Parliament, when the rebellion in Scotland (1745) alarmed the government for the loyalty of Ireland. The Earl of Chesterfield, celebrated for his literary productions, was, in this exigency, sent for a short time as lord-lieutenant, and allowed to hold forth all possible encouragement to the Catholics and patriotic party. By discountenancing party distinctions, and giving the Catholics the full protection of the laws, he so effectually soothed and tranquillised the country, that while the neighbouring Protestant kingdoms exhibited an army seeking the restoration of a Catholic prince, Ireland, though full of Christians of that persuasion, and bound to the Jacobite cause by many endeared associations, remained perfectly faithful to the Hanover dynasty. When the danger was past, the earl was recalled, and the former system resumed. The struggles of the patriots with the English ministerial party were continued with unabated violence down to the death of George II., without producing any marked benefit to Ireland, although at one time the former party gained an ascendancy in the native Parliament.

## CASE OF MR WILKES.

Ever since the accession of the Brunswick family in 1714, the government had been chiefly conducted by the Whig party, who formed a very powerful section of the aristocracy of England. Walpole, Pelham, Newcastle, and Pitt, had all ruled chiefly through the strength of this great body, who, till a period subsequent to the rebellion of 1745, seem to have had the support of the more influential portion of the people. After that period, when the Stuart claims ceased to have any effect in keeping the crown in check, a division appears to have grown up between the government and the people, which was manifested in various forms even before the demise of George II., but broke out in a very violent manner during the early years of his successor's reign. George III., who had imbibed high notions of the royal prerogative from the Earl of Bute, showed, from the beginning of his career, an anxious desire to extend the power of the crown, to shake off the influence of the great Whig families, and keep popular force of all kinds within strict limits.

A stranger, with no connexion in the country, a favourite, and, moreover, a man of unprepossessing manners, the Earl of Bute had neither the support of the aristocracy nor of the people. He was assailed in Parliament, and through the newspapers, with the most violent abuse—the unpopular peace furnishing a powerful topic against him. To this storm he at length yielded, by retiring (April 8, 1763).

Among the public writers who assailed the ministry, none was more virulent than Mr John Wilkes, member for Aylesbury, and editor of a paper entitled the 'North Briton.' Mr George Grenville, who succeeded Bute, commenced his career by prosecuting Wilkes for a libel, contained in the forty-fifth number of his paper, in which he had directly accused his majesty of falsehood. The king's messenger, being provided with a general warrant against the editor, printers, and publishers of the 'North Briton,' entered the house of Mr Wilkes, and apprehended him. After being examined before the secretaries of state, he was committed to the Tower, and his papers were seized and sealed up. A few days after, he was brought to Westminster Hall by *habes corpus*, and released by Chief-Justice Pratt, in consideration of his being a member of Parliament. The Parliament ordered the seditious paper to be burnt by the hands of the common hangman—an operation that produced a riot, not in itself dangerous, but serving to discover the angry spirit of the populace. Mr Wilkes was soon after expelled from the House of Commons, and found it convenient to retire to the continent. One result of his case was favourable to the popular cause: a prosecution which he instituted against the secretary of state, on the plea that his seizure was illegal, terminated in a verdict of damages, and a declaration by Chief-Justice Pratt, that general warrants were inconsistent with the laws of England.

## AMERICAN STAMP ACT.

The administration of Mr Grenville is memorable for the first attempt to tax the American colonies. An act passed under his influence (March 1765) for imposing stamps on those countries, appeared to the colonists as a step extremely dangerous to their liberties, considering that they had no share in the representation. They therefore combined almost universally to resist the introduction of the stamped paper by which the tax was to be raised. Resolutions were passed in the various assemblies of the States protesting against the assumed right of the British legislature to tax them. Partly by popular violence, and partly by the declarations issued by the local legislative assemblies, the object of the act was completely defeated.

The home government were then induced to agree to the repeal of the act, but with the reservation of a right to impose taxes on the colonies. Between the Stamp Act and its repeal, a change had taken place in the administration: the latter measure was the act

of a Whig ministry under the Marquis of Rockingham, which, however, did not long continue in power, being supplanted by one in which Mr Pitt, now created Earl of Chatham, held a conspicuous place. The second Pitt administration was less popular than the first: the Earl of Chesterfield, reflecting on the title conferred on the minister, at the same time that he sunk in general esteem, called his rise a *fall up stairs*. All the ministries of this period laboured under a popular suspicion, probably not well founded, that they only obeyed the will of the sovereign, while the obnoxious Earl of Bute, as a secret adviser behind the throne, was the real, though irresponsible minister.

At the suggestion of Mr Charles Townsend, a member of the Earl of Chatham's cabinet, it was resolved, in 1767, to impose taxes on the Americans in a new shape; namely, upon British goods imported into the colonies, for which there was some show of precedent. An act for imposing duties on tea, glass, and colours, was accordingly passed with little opposition. Soon after this, Mr Townsend died, and the Earl of Chatham, who had been prevented by illness from taking any share in the business, resigned. The Americans met the new burdens with the same violent opposition as formerly.

## THE WILKES TUMULTS.

Early in 1768, a new administration was formed under the Duke of Grafton, a pupil of Chatham, and soon after a new Parliament was called. At the general election, Mr Wilkes reappeared in England, though a sentence of outlawry still stood against him. He even ventured to become candidate for the county of Middlesex, where he was returned by a large majority. Having previously surrendered to the jurisdiction of the King's Bench, his outlawry was reversed; but by virtue of the verdicts which two courts had given against him, he was subjected to a fine and two years' imprisonment. On his arrest, Mr Wilkes quietly committed himself to the officers of justice, but was forcibly rescued by the populace; and in a riot subsequent to this violence, a young man, who had no participation in the tumult, was killed. During his imprisonment, Mr Wilkes was formally expelled the House of Commons, on the pretext that, by the vote of censure passed by the preceding Parliament, he was for ever disqualified from being a representative of the people. This decision incensed a great portion of the community, and the case became identified in their estimation with the liberties of the nation itself. Four times did the county of Middlesex return Mr Wilkes; but the rival candidate, Colonel Luttrell, with only a fourth of the votes, was accepted by the House.

These proceedings occasioned many keen debates in the House of Commons, where an opposition of much talent and ardour of purpose now took up every popular question. Tumults of a dangerous character were constantly taking place; the cry of 'Wilkes and Liberty' resounded everywhere, excepting only in Scotland, his scurrility against the Scotch having rendered him generally detested in that country. Even the municipal bodies and corporations, though usually not easily moved by popular topics, became zealous partisans of Mr Wilkes, and thought it their duty to remonstrate with the king on the arbitrary manner with which his government was conducted.

At this much-agitated time (1769), an unknown writer, styling himself Junius, commenced a series of letters in the 'Public Advertiser' newspaper, animadverting in the most virulent manner on both the men and measures of the government. These compositions were the more remarkable, as, from the force and elegance of their style, they were evidently the production of some person not only far above the usual character of newspaper writers, but fitted to rank with the first intellects of his day. The publisher of the newspaper was prosecuted for publishing them; but the author remained concealed, and his name, though still an object of curiosity, has never been discovered.

MINISTRY OF LORD NORTH—THE CITY OF LONDON'S  
REMONSTRANCE.

At the opening of Parliament in January 1770, it was expected that the conspicuous topic in the king's speech would be the Middlesex election. The surprise was general when it was found that the king did not make the least reference to the troubles respecting Mr Wilkes. The Opposition were enraged at this oversight, and moved, as an amendment to the address, that an inquiry ought to be made into the causes of the prevailing discontents; on which occasion, Charles James Fox, afterwards so celebrated as a political leader, made his first speech in Parliament. The amendment was negatived by 254 against 138, which showed that his majesty was quite secure of the support of the House of Commons.

At this time, the Duke of Grafton retired from the cabinet, and his place was supplied by Lord North, son of the Earl of Guilford. The new ministry was the tenth which had existed during as many years, but the first in which the king might be considered as completely free of the great Whig families, who, by their parliamentary influence, had possessed the chief power since the Revolution. This was the beginning of a series of Tory administrations, which, with few and short intervals, conducted the affairs of the nation down to the close of the reign of George IV.

The supposed injury which the cause of free election had sustained from the decision of the House of Commons, still for a time agitated the public mind. Forty-eight peers, including all the great Whig chiefs (Devonshire, Rockingham, Grosvenor, Fitzwilliam, Tankerville, King, &c.), besides the Earl of Chatham, made a public declaration that they should not cease their efforts till they had obtained full justice to the electors of Britain. The city of London, and some other corporations of note, presented remonstrances to the king on the same subject. The policy of the king and cabinet was to wear out the public fervour by dignified silence. No notice was therefore taken of these remonstrances; and under this species of policy the Wilkes agitations in time subsided.

## THE AMERICAN WAR OF INDEPENDENCE.

Meanwhile the remonstrances of the American colonists had induced the ministry to give up all the new taxes, with the exception of that on tea, which it was determined to keep up, as an assertion of the right of Parliament to tax the colonies. In America, this remaining tax continued to excite as much discontent as the whole had formerly done, for it was the principle of a right to impose taxes which they found fault with, and not the amount of the tax itself. Their discontent with the mother country was found to affect trade considerably, and the British merchants were anxious to bring the dispute to a close. The government was then induced to grant such a drawback from the British duty on tea, as enabled the East India Company to offer the article in America at a lower rate than formerly, so that the American duty, which was only threepence a pound, did not affect the price. It was never doubted that this expedient would satisfy the colonists, and large shipments of tea were accordingly sent out from the British ports. The principle of the right to tax still lurked, however, under the concession, and the result only showed how little the sentiments of the Americans were understood at home.

The approach of the tea cargoes excited them in a manner totally unlooked for in Britain. At New York and Philadelphia, the cargoes were forbidden to land. In Charlestown, where they were permitted to land, they were put into stores, and prohibited from being sold. At Boston, a ship-load, which had been introduced into the harbour, was seized by a lawless mob, and tossed into the sea. This last act of violence was resented by the passing of a bill in Parliament for interdicting all commercial intercourse with the port of Boston, and another for taking away the legislative

assembly of the state of Massachusetts. The former measure was easily obviated by local arrangements; and in reference to the latter, a Congress of representatives from the various States met at Philadelphia, in September 1774, when it was asserted that the exclusive power of legislation, in all cases of taxation and internal policy, resided in the provincial legislatures. The same assembly denounced other grievances, which have not here been particularly adverted to, especially an act of the British legislature for trying Americans, for treasonable practices, in England. The Congress also framed a covenant of non-intercourse, by which the whole utility of the colonies to the mother country, as objects of trading speculation, was at once laid prostrate. The colonists still avowed a desire to be reconciled, on the condition of a repeal of the obnoxious statutes. But the government had now resolved to attempt the reduction of the colonists by force of arms. Henceforth, every proposal from America was treated with a haughty silence on the part of the British monarch and his advisers.

The war opened in the summer of 1775, by skirmishes between the British troops and armed provincials, for the possession of certain magazines. At the beginning there seemed no hope of the contest being protracted beyond one campaign. The population of the colonies was at this time under three millions, and they were greatly inferior in discipline and appointments to the British troops. They possessed, however, an indomitable zeal in the cause they had agreed to defend, and fought with the advantage of being in the country of their friends. At Bunker's Hill, near Boston (June 17, 1775), they had the superiority in a well-contested fight with the British troops, of whom between two and three hundred were killed. At the end of one year, the British government was surprised to find that no progress had been made towards a reduction of the Americans, and sent out an offer of pardon to the colonists, on condition that they would lay down their arms. The proposal only met with ridicule.

On the 4th of July 1776, the American Congress took the decisive step of a declaration of their independence, embodying their sentiment in a document remarkable for its pathos and solemnity. During the next two campaigns, the slender forces of the new republic were hardly able anywhere to face the large and well-appointed armies of Great Britain. Much misery was endured by this hardy people in resisting the British arms. Notwithstanding every disadvantage and many defeats, America remained unsubdued.

The first serious alarm for the success of the contest in America, was communicated in December 1777, by intelligence of the surrender of an army under General Burgoyne at Saratoga. In the House of Commons, the ministers acknowledged this defeat with marks of deep dejection, but still professed to entertain sanguine hopes, from the vigour with which the large towns throughout Britain were now raising men at their own expense for the service of the government. Mr Fox, the leader of the Opposition, made a motion for the discontinuance of the war, which was lost by 165 to 259, a much narrower majority than any which the ministry had before reckoned in the Lower House.

In proportion to the dejection of the government, was the elation of the American Congress. Little more than two years before, the British sovereign and ministers had treated the petitions of the colonists with silent contempt; but such had been the current of events, that, in 1778, they found it necessary, in order to appease the popular discontent, to send out commissioners, almost for the purpose of begging a peace. As if to avenge themselves for the indignities of 1775, the Americans received these commissioners with the like haughtiness; and being convinced that they could secure their independence, would listen to no proposals in which the acknowledgment of that independence, and the withdrawal of the British troops, did not occupy the first place. The ministers, unwilling to submit to such terms, resolved to prosecute the war, holding forth

to the public, as the best defence of their conduct, the necessity of curbing the spirit of insubordination, both in the American colonies and at home, which they described as threatening the overturn of the most sacred of the national institutions.

The rise of Great Britain during the seventeenth and eighteenth centuries, in wealth and military and naval power, had been observed by many of the surrounding states with no small degree of jealousy. France, in particular, had not yet forgiven the triumphant peace which Britain had dictated in 1763. The Americans, therefore, by their emissary, the celebrated Benjamin Franklin, found no great difficulty in forming an alliance with France, in which the latter power acknowledged the independence of the colonists, and promised to send them large auxiliary forces. Viewing the distressed state to which Britain was reduced by the contest, and concluding that the time had arrived to strike a decisive blow for her humiliation, Spain soon after declared war against her; and in 1780, Holland was added to the number of her enemies. Russia then put herself at the head of what was called an Armed Neutrality, embracing Sweden and Denmark, the object of which was indirectly hostile to Britain. So tremendous was the force reared against Britain in 1779, even before all these powers had entered into hostilities, that it required about 300,000 armed men, 300 armed vessels, and twenty millions of money annually, merely to protect herself from her enemies. Even her wonted superiority at sea seemed to have deserted her; and for some time the people beheld the unwonted spectacle of a hostile fleet riding in the Channel, which there was no adequate means of opposing.

It was now obvious to the whole nation that this contest, upon whatever grounds it commenced, was a great national misfortune; and the Opposition in Parliament began to gain considerably in strength. After some votes, in which the ministerial majorities appeared to be gradually lessening, Mr Dunning, on the 6th of April 1780, carried, by a majority of eighteen, a motion, 'that the influence of the crown had increased, was increasing, and ought to be diminished.' This was looked upon as a severe censure of the government, considering that the House of Commons was not altogether a popular body, but included many who had seats there only through the influence of the crown, or by the favour of the nobility and gentry.

In the year 1778, an act had been passed, relieving the Roman Catholics in England from some of the severe penal statutes formerly enacted against them. The apprehension of a similar act for Scotland caused the people of that country to form an immense number of associations with a view to opposing it; and in the early part of 1779, the popular spirit broke out at Edinburgh and Glasgow in several alarming riots, during which one or two Catholic chapels, and some houses belonging to Catholics, were pillaged and burnt. An extensive Protestant Association was also formed in England, to endeavour to procure the repeal of the English act. This body was chiefly led by Lord George Gordon, a son of the late Duke of Gordon, and member of the House of Commons. In June 1780, an immense mob assembled in London to accompany Lord George to the House of Commons, where he was to present a petition against the act, signed by 120,000 persons. His motion for the repeal of the act being rejected by a vast majority, he came out to the lobby and harangued the crowd in violent terms, suggesting to them similar acts to those which had taken place in Scotland. The mob accordingly proceeded to demolish the chapels of the foreign ambassadors. Meeting with no effectual resistance, for the magistrates of the city were afraid to take decisive measures against them, they attacked Newgate, released the prisoners, and set the prison on fire. The new prison at Clerkenwell, the King's Bench, and Fleet Prisons, and the New Bridewell, were treated in like manner. At one time, thirty-six fires were seen throughout the city. The mob had uncontrolled possession of the streets for five days, pillaging, burning,

and demolishing; until the king in council determined to authorise the military to put them down by force of arms. Tranquillity was then restored, but not before upwards of 400 persons were killed and wounded. Many of the ringleaders were convicted and executed. Lord George Gordon was tried for high treason, but acquitted on a plea of insanity, which his subsequent life showed to be well founded. Similar outrages were attempted in other cities, but prevented by the vigour of the magistrates. The chief sufferers from these riots were the party who aimed at political reform. On the other hand, the king obtained increased respect, in consequence of the firmness he had shown in taking measures for the suppression of the riots.

The states of North and South Carolina, which contained a larger proportion of persons friendly to the British crown than any of the northern states, had submitted, in 1780, to a British army under General Clinton. Next year, the greater part of the troops which had been left in those states were conducted northward by Lord Cornwallis, in the hope of making further conquests; but the consequence was, that General Greene, after a series of conflicts, in which he greatly distressed various parties of the British troops, regained both Carolinas, while Lord Cornwallis took up a position at Yorktown in Virginia. At this time, General Washington, the American commander-in-chief, to whose extraordinary sagacity and purity of motives the colonists chiefly owed their independence, was threatening General Clinton's army at New York. Clinton tamely saw him retire to the southward, believing that he only meant to make a feint, in order to draw away the British from New York, when he in reality meant to attack Cornwallis. On the 29th of September (1781), Yorktown was invested by this and other corps of Americans and French; and in three weeks more, the British batteries being completely silenced, Lord Cornwallis surrendered with his whole army. With this event, though some posts were still kept up by British troops, hostilities might be said to have been concluded.

At the next opening of Parliament, many of those who had formerly supported the war, began to adopt opposite views; and early in 1782, a motion, made by General Conway, for the conclusion of the war, was carried by a majority of nineteen. The necessary consequence was, that, on the 20th of March, Lord North and his colleagues resigned office, after twelve years of continued misfortune, during which the prosperity of the country had been retarded, a hundred millions added to the national debt, and three millions of people separated from the parent state.

As usual in such cases, a new administration was formed out of the Opposition. The Marquis of Rockingham was made prime minister, and Mr Fox one of the secretaries of state. The new ministers lost no time in taking measures for the restoration of peace. Unfortunately for their credit with the nation, Sir George Rodney gained an important victory over the French fleet off the island of Dominica, April 12, 1782, after the ministers had despatched another officer to supersede him in the command. On this occasion, thirty-seven British vessels encountered thirty-four French; and chiefly by the dexterous manœuvre of a breach of the enemy's line, gained one of the most complete victories recorded in modern warfare. The triumph was eminently necessary, to recover in some measure the national honour, and enable the ministers to conclude the war upon tolerable terms. In November, provisional articles for a peace with the United States of America, now acknowledged as an independent power, were signed at Paris, and the treaty was concluded in the ensuing February. When the American ambassador was afterwards, for the first time, introduced at the British levée, the king received him kindly, and said with a manly frankness, that though he had been the last man in his dominions to desire that the independence of America should be acknowledged, he should also be the last to wish that that acknowledgment

should be withdrawn. War was soon after concluded with France, Spain, and Holland, but not without some considerable concessions of colonial territory on the part of Great Britain.

The conclusion of this war is memorable as a period of great suffering, arising from the exhaustion of the national resources, the depression of commerce, and the accident of a bad harvest. The principles of prosperity were, after all, found to be so firmly rooted in the country, that immediately after the first distresses had passed away, every department of the state resumed its wonted vigour, and during the ensuing ten years of peace, a great advance was made in national wealth.

On the unexpected death of the Marquis of Rockingham, in July 1782, the king chose as his successor the Earl of Shelburne, who, though nominally a Whig, was not sufficiently inclined to the general measures of that party to be agreeable to Mr Fox and other leading members of the cabinet. On their consequent resignation, the vacancies were filled up by the friends of Shelburne, among whom was Mr William Pitt, a younger son of the Earl of Chatham. This young statesman, to whom was assigned the office of chancellor of the exchequer, had already distinguished himself by the part he took in the popular proceedings for a reform of the House of Commons—an object which the Opposition and their supporters had for some years advocated with great zeal, but which soon after fell in a great measure out of public notice.

#### COALITION MINISTRY.

The present ministry was opposed by two parties of very different principles—namely, the adherents of the North administration, and the friends of those Whigs who had lately retired from the cabinet. These two parties, notwithstanding that they had been opposed to each other throughout all the late war, coalesced for factious or ambitious purposes; and being triumphant over the ministry, forced themselves upon the king's counsels. Then was formed (April 2, 1783) what was called the Coalition Ministry, in which Lord North and Mr Fox acted together as secretaries of state, though two years had hardly elapsed since the latter had breathed the most violent threats in Parliament against his present associate. A coalition, in which political principle was supposed to be abandoned for the sake of office, could not be agreeable to the nation, while it was evidently embarrassing to the sovereign. Mr Fox had prepared and carried through the Lower House his famous bill for the regulation of the East India Company, by which all authority was to devolve on seven directors chosen by the House of Commons; in other words, by which the immense patronage of this offshoot of the empire was to fall into the hands of the ministry. The India bill, as it was called, was generally supposed to aim at fixing the ministry in power beyond the control of both king and people, and it accordingly roused much indignation. His majesty therefore, fully confident of support from the people, used his personal influence, in no covert way, to induce the House of Lords to reject the bill, and (December 18) sent a messenger to demand the seals of office from his over-ambitious ministers, appointing Mr Pitt to be the prime minister and chancellor of the exchequer of a new cabinet, consisting chiefly of his majesty's friends.

The various departments of the state were now thrown into a relative position, which had never been known before, and has never recurred. The king and his ministers, backed by a decided majority of the public, were opposed by two powerful aristocratic factions in the House of Commons, who defeated every measure that was introduced, refused the usual supplies, and voted again and again resolutions against the continuance of the present men in office, which they denounced as unconstitutional. But in the course of a few weeks, the influence of the Opposition was sensibly reduced; the public sentiment and the power of the court began to take effect even on this intractable body; and when at length their majority had been

worn down to *one*, which happened on a motion by Mr Fox, the king dissolved the Parliament—a measure which, whatever it might promise to him, he did not previously think justifiable. So far were the votes of the coalition from being based on popular support, that in the new election, no fewer than one hundred and sixty members lost their seats. The new House of Commons was so favourable towards the king and ministry, as to enable the public service to go on without further interruption.

#### LEGISLATIVE MEASURES IN IRELAND.

From the end of the reign of George I., a patriotic party in Ireland, composed of a mixture of Catholics and Protestants, had been exerting itself to reduce the influence of the English ministry in their country. The resistance of the American colonists gave a powerful stimulus to this body; and on some alarm of an invasion of the French, they found a pretext for taking up arms, apparently for the protection of the country, but in reality to render themselves formidable to England. Encouraged by Parliament, and headed by the principal men in the country, the Volunteer Corps, as they were called, held meetings and passed resolutions, in which they openly avowed their determination, at the hazard of life and fortune, to achieve the independence of the native legislature, and a complete participation in the commercial rights of the British. The government, being then too feeble to resist, bowed to their demands. Poynning's law, and others which had given the English Parliament a right to interfere with Ireland, were repealed; and acts were passed for the right of *habeas corpus* and the independence of the judges. In November 1783, the volunteers held a grand convention in Dublin, and proposed to urge the question of parliamentary reform; but the government now began to regain strength, and in a short time, by skilful measures, it prevailed upon the corps to dissolve.

#### MINISTRY OF MR PITT—FROM 1784 TO THE COMMENCEMENT OF THE FRENCH REVOLUTION.

Though the favourite minister of a sovereign decidedly opposed to all popular innovations, Mr Pitt continued to profess his former zeal for a reform in the House of Commons; but, as might be expected, was unable to bring the power of the government to bear upon the subject. In April 1785, he asked leave of the House to bring in a bill for this object; but it was refused by a large majority. The desire of parliamentary reform nevertheless continued to animate a large portion of the community. In 1784, a regular society had been instituted in Scotland, for the purpose of obtaining such a measure; and in the succeeding year, forty-nine out of the sixty-six boroughs had declared in favour of it. There were also numerous associations of a similar character throughout England.

In 1786, Mr Pitt established his celebrated but fallacious scheme for redeeming the national debt, by what was called a Sinking Fund. The revenue was at this time above fifteen millions, being about one million more than was required for the public service. This excess he proposed to lay aside annually, to lie at compound interest; by which means he calculated that each million would be quadrupled at the end of twenty-eight years, and thus go a great way towards the object he had in view. To this scheme Mr Fox added the infinitely more absurd amendment, that, when the government required to borrow more money, one million of every six so obtained should be laid aside for the same purpose. The scheme was so well received as to increase the popularity of the minister, and it was not till 1813 that its fallacy was proved.

In the same year commenced the parliamentary proceedings against Mr Warren Hastings, for alleged cruelty and robbery exercised upon the natives of India during his governorship of that dependency of Great Britain. These proceedings were urged by Mr Burke and other members of the Whig party, and excited so much public indignation against Mr Hastings, that the

ministry was obliged, though unwillingly, to lend their countenance to his trial, which took place before Parliament in the most solemn manner, and occupied in the aggregate one hundred and forty-nine days, extending over a space of several years. The proceedings resulted in the acquittal of Mr Hastings.

The king and queen had in the meantime become the parents of a numerous family of sons and daughters. The eldest son, George, Prince of Wales, had now for several years been of age, and exempted from the control of his father. He had no sooner been set up in an establishment of his own, than he plunged into a career of prodigality, forming the most striking contrast with the chastened simplicity and decorum of the paternal abode. He also attached himself to the party of the Opposition, though rather apparently from a principle of contradiction to his father, than a sincere approbation of their political objects. The result was the complete alienation of the Prince of Wales from the affections of his majesty.

In November 1788, an aberration of intellect, resulting from an illness of some duration, was observed in the king, and it became necessary to provide some species of substitute for the exercise of the royal functions. To have invested the Prince of Wales with the regency, appeared the most obvious course; but this would have thrown out the ministry, as it was to be supposed that his royal highness would call the chiefs of his own party to his councils. Mr Fox contended that the hereditary nature of the monarchy pointed out an unconditional right in the prince to assume the supreme power under such circumstances; but Mr Pitt asserted the right of Parliament to give or withhold such an office, and proposed to assign certain limits to the authority of the intended regent, which would have placed the existing ministry beyond his reach. The Irish Parliament voted the unconditional regency to the prince; but that of Great Britain was about to adopt the modified plan proposed by Mr Pitt, when, March 1789, the king suddenly recovered, and put an end to the difficulty. The debates on the regency question exhibit in a very striking light how statesmen will sometimes abandon their most favourite dogmas and strongest principles on the call of their own immediate interests.

#### MISCELLANEOUS CIRCUMSTANCES FROM 1760 TO 1790.

At the beginning of the reign of George III., both the commerce and the manufactures of the country might be considered as in a highly flourishing condition. Scotland was not now, as formerly, exempt from the general prosperity. In that country, since the year 1746, great improvements of various kinds had taken place: the linen manufacture had been much advanced; a trade with the colonies had sprung up; agriculture was undergoing great changes for the better; the Highlands were now peaceful, and throughout the whole country were seen conspicuous symptoms of increasing wealth and comfort, and their natural consequence, refinement of manners.

During the first ten years of the reign of George III., some discoveries and inventions were made, by which the prosperity of the whole empire received a new impulse. By the improvements effected in the steam-engine by Mr James Watt, a superior mechanic power was obtained for the driving of machinery and other purposes. Mr James Hargreaves of Blackburn invented the *spinning-jenny*, a contrivance for abridging the use of hand-labour in the cotton manufacture. Upon this an improvement was afterwards made by Mr Richard Arkwright, who invented what was called the *spinning-frame*, by which a vast number of threads of the utmost fineness were spun with very little aid from hand-labour. A third invention, called the *mule-jenny*, by Mr Crompton of Bolton, came into use some years later; and finally, the *power-loom* was invented, by Dr Cartwright, for superseding hand-labour in weaving. By these means, the cotton manufacture was brought to a pitch of prosperity in Britain, such as no particular

branch of manufacture had ever experienced before in any country. The immense wealth produced by it is allowed to have been what chiefly enabled the nation to sustain the great contest in which it was afterwards involved with France. Considering these results, the original condition of the principal persons concerned in improving the manufacture is somewhat remarkable. Mr Watt, who gave it a mechanic force in the steam-engine, was an artisan in his early days; Mr Hargreaves was a carpenter; and Mr Arkwright a dresser of hair. The last, who was knighted by George III., left at his death nearly a million sterling, realised by the profits of his invention.

The early part of the reign of George III. was distinguished by the discoveries of Captain Cook in the Pacific Ocean, by the formation of many canals for internal navigation, and by the foundation of the Royal Academy for the Promotion of the Fine Arts. This period derives lustre from the admirable paintings of Barry, Blake, Hoppner, and Reynolds. Astronomy was cultivated by Dr William Herschel, who in 1781 discovered the planet Uranus. Chemistry was improved by Dr Joseph Black and Mr Cavendish. The science of medicine was advanced by Dr Cullen of Edinburgh; and natural history by Sir Joseph Banks. In literature, the chief place is due to Dr Samuel Johnson, who had flourished also in the preceding reign. Oliver Goldsmith, Mark Akenside, and William Cowper, were the most eminent poets. History was written in a masterly manner by Dr William Robertson and David Hume; Henry Home, David Hume, and Adam Smith, figure as philosophical writers; Sir William Blackstone wrote on English law; and amongst divines, the most eminent were Bishops Warburton, Jortin, and Hurd.

#### FRENCH REVOLUTION, AND CONSEQUENT WAR WITH FRANCE.

The country had for several years experienced the utmost prosperity and peace, when it was roused by a series of events which took place in France. The proceedings of the French nation for redressing the political grievances under which they had long laboured, commenced in 1789, and were at first very generally applauded in Britain, as likely to raise that nation to a rational degree of freedom. Ere long, the violence shown at the destruction of the Bastille, the abolition of hereditary privileges, the open disrespect for religion, and other symptoms of an extravagant spirit, manifested by the French, produced a considerable change in the sentiments of the British people. The proceedings of the French were still justified by the principal leaders of Opposition in Parliament, and by a numerous class of the community; but they inspired the government, and the propertied and privileged classes generally, with great alarm and distrust.

When at length the coalition of Austria and Prussia with the fugitive noblesse had excited the spirit of the French people to a species of frenzy, and led to the establishment of a Republic, and the death of the king, the British government and its supporters were effectually roused to a sense of the danger which hung over all ancient institutions, and a pretext was found (January 1793) for declaring war against France. A comparatively small body of the people were opposed to this step, which was also loudly deprecated in Parliament by Messrs Fox and Sheridan; but all these remonstrances were drowned in the general voice of the nation. At such a crisis, to speak of political reforms in England seemed the height of imprudence, as tending to encourage the French. All, therefore, who continued to make open demonstrations for that cause, were now branded as enemies to religion and civil order. In Scotland, Mr Thomas Muir, a barrister, and Mr Palmer, a Unitarian clergyman, were tried for sedition, and sentenced to various terms of banishment. Citizens named Skirving, Gerald, and Margat, were treated in like manner by the Scottish criminal judges, for offences which could only be said to derive the character ascribed to them from the temporary and accidental circumstances of the nation. An attempt to

inflict similar punishments upon the English reformers, was defeated by the acquittal of a shoemaker named Hardy; but the party was nevertheless subjected, with the apparent concurrence of a large and influential portion of the people, to many minor severities.

After alliances had been formed with the other powers hostile to France, the British ministers despatched an army to the Netherlands, under the command of the king's second son, the Duke of York, to co-operate in reducing the fortresses in possession of the French, while the town of Toulon, being inclined to remain under the authority of the royal family, put itself into the hands of a British naval commander. At first, the French seemed to fail somewhat in their defences; but on a more ardently republican party acceding to power under the direction of the famous Robespierre, the national energies were much increased, and the Duke of Brunswick experienced a series of disgraceful reverses. The Prussian government, having adopted new views of the condition of France, now began to withdraw its troops, on the pretext of being unable to pay them; and though Britain gave nearly a million and a quarter sterling to induce this power to remain nine months longer upon the field, its co-operation was of no further service, and was soon altogether lost. On the 1st of June 1794, the French Brest fleet sustained a severe defeat from Lord Howe, with the loss of six ships; but the republican troops not only drove the combined armies out of the Netherlands, but taking advantage of an unusually hard frost, invaded Holland by the ice which covered the Rhine, and reduced that country to a Republic under their own control. The successes of the British were limited to the above naval victory, the temporary possession of Corsica and Toulon, the capture of several of the French colonies in the West Indies, and the spoliation of a great quantity of the commercial shipping of France; against which were to be reckoned the expulsion of an army from the Netherlands, the loss of 10,000 men and 60,000 stand of arms, in an unsuccessful descent upon the west coast of France, some considerable losses in mercantile shipping, and an increase of annual expenditure from about fourteen to nearly forty millions.

In the course of the year 1795, the lower portions of the community began to appear violently discontented with the progress of the war, and to renew their demands for reform in the state. As the king was passing (October 29) to open the session of Parliament, a stone was thrown into his coach, and the interference of the horse guards was required to protect his person from an infuriated mob. The ministers consequently obtained acts for more effectually repressing sedition, and for the dispersion of political meetings. They were at the same time compelled to make a show of yielding to the popular clamour for peace; and commenced a negotiation with the French Directory, which was broken off by the refusal of France to restore Belgium to Austria. In the ensuing year, so far from any advance being made towards the subjugation of France, the northern states of Italy were overrun by its armies, and formed into what was called the Cisalpine Republic. The celebrated Napoleon Bonaparte made his first conspicuous appearance as the leader of this expedition, which terminated in Austria submitting to a humiliating peace. At the close of 1796, a French fleet sailed for Ireland, with the design of revolutionising that country, and detaching it from Britain; but its object was defeated by stress of weather. At this crisis, a new attempt was made to negotiate with the French Republic; but as the events of the year had been decidedly favourable to France, a renewed demand of the British for the surrender of Belgium was looked upon as a proof that they were not sincere in their proposals, and their agent was insultingly ordered to leave the French territory. To add to the distresses of Britain, while Austria was withdrawn from the number of her allies, Spain, by a declaration of war in 1797, increased in no inconsiderable degree the immense force with which she had to contend.

## THREATENED INVASION—SUBSEQUENT EVENTS.

For some time an invasion of Britain had been threatened by France; and, sacred as the land had been for centuries from the touch of a foreign enemy, the successes of the republicans had hitherto so greatly exceeded all previous calculation, that the execution of their design did not appear improbable. Just as the interference of the neighbouring powers had, in 1792, roused the energies of the French, so did this proposed invasion stimulate the spirit of the British people. The clamours of reformers, and of those who were friendly to France, were now lost in an almost universal zeal for the defence of the country; and not only were volunteer corps everywhere formed, but the desire of prosecuting the war became nearly the ruling sentiment of the nation. The ministers, perceiving the advantage which was to be derived from the tendency of the national spirit, appeared seriously to dread an invasion, and thus produced an unexpected and very distressing result. The credit of the Bank of England was shaken; a run was made upon it for gold in exchange for its notes, which it could not meet. On the 25th of February 1797, therefore, the Bank was obliged, with the sanction of the privy-council, to suspend cash payments—that is, to refuse giving coin on demand for the paper money which had been issued. This step led to a great depreciation in the value of Bank of England notes; and was followed by a very serious derangement of the currency for a number of years.

In April, a new alarm arose from the proceedings of the seamen on board the Channel fleet, who mutinied for an advance of pay, and the redress of some alleged grievances. A convention of delegates from the various ships met in Lord Howe's cabin, and drew up petitions to the House of Commons and the Board of Admiralty. Upon these being yielded to, order was restored; but the seamen on board the fleet at the Nore soon after broke out in a much more alarming revolt; and on the refusal of their demands, moored their vessels across the Thames, threatening to cut off all communication between London and the open sea. The reduction of this mutiny appeared at one time as if it could only be effected by much bloodshed; but by the firmness of the government, and some skilful dealings with the seamen, a loyal party was formed, by whom the more turbulent men were secured, and the vessels restored to their respective officers. The ringleaders, the chief of whom was a young man named Richard Parker, were tried and executed.

The same year was remarkable for several victories gained by the British fleets. A Spanish fleet of twenty-seven ships was attacked by fifteen vessels under Admiral Jervis (February 14), off Cape St Vincent, and completely beaten, with the loss of four large vessels. A fleet under Admiral Harvey, with a military force under Sir Ralph Abercromby, captured the island of Trinidad, a Spanish colony. In October, a Dutch fleet, under Admiral De Winter, was attacked off the village of Camperdown, upon their own coast, by Admiral Duncan, who, after a desperate battle, captured nine of the enemy's vessels. These naval successes compensated in some measure for the many land victories of the French, and served to sustain the spirit of the British nation under this unfortunate contest.

In 1798, the French overran and added to their dominions the ancient republic of Switzerland, which gave them a frontier contiguous to Austria, and enabled them eventually to act with increased readiness and force upon that country. In this year, the directors of the French Republic, beginning to be afraid of the ambition of their general, Bonaparte, sent him at the head of an expedition to reduce and colonise Egypt, intending from that country to act against the British empire in the East Indies. The expedition was successful in its first object; but the fleet which had conveyed it was attacked in Aboukir Bay, by Admiral Nelson (August 1), and almost totally destroyed or captured. While so much of the strength of the French army was

thus secluded in a distant country, the eastern powers of Europe thought they might safely recommence war with the republic. Austria, Naples, and Russia, formed a confederacy for this purpose; and Britain, to supply the necessary funds, submitted to the grievance of an income tax, amounting in general to ten per cent., in addition to all her previous burdens.

The new confederacy was so successful in 1799, as to redeem the greater part of Italy. A Russian army, under the famous Suwaroff, acted a prominent part in the campaign; but, in the end, attempting to expel the French from Switzerland, this large force was nearly cut to pieces in one of the defiles of that mountainous country. In August of the same year, Great Britain made a corresponding attempt to expel the French from Holland. Thirty-five thousand men, under the Duke of York, formed the military part of the expedition. The fleet was successful at the first in taking the Dutch ships; but the army, having landed under stress of weather at an unfavourable place for their operations, was obliged, after an abortive series of skirmishes, to make an agreement with the French, purchasing permission to go back to their country by the surrender of 8000 prisoners from England.

The reverses which France experienced in 1799, were generally attributed to the weakness of the Directory—a council of five, to which the executive had been intrusted. Bonaparte suddenly returned from his army in Egypt, and, by a skilful management of his popularity, overturned the Directory, and caused himself to be appointed the sole depositary of the executive power of the state, under the denomination of First Consul. He immediately wrote a letter to King George, making overtures of peace, but was answered, by the British secretary, that no dependence could be placed by Great Britain on any treaty with France, unless her government were again consolidated under the Bourbons. Bonaparte, having much reason to wish for peace, made a reply to this note, vindicating France from the charge brought against her, of having commenced a system of aggression inconsistent with the interests of other states, and asserting her right to choose her own government—a point, he said, that could not decently be contested by the minister of a crown which was held by no other tenure. But the British government was at this time too much elated by the expulsion of the French army from Italy, and the late changes in the executive, which, in their estimation, betokened weakness, to be immediately anxious for peace.

The events of 1800 were of a very different nature from what had been calculated upon in England. Sir Sidney Smith, who commanded the British forces in Syria, had made a treaty with the French army after it had been left by Bonaparte, whereby it was agreed that the French should abandon Egypt, and retire unmolested to their own country. The British government, in its present temper, refused to ratify this arrangement; and the consequence was a continuance of hostilities. The French overthrew a large Turkish army at Grand Cairo, and made themselves more effectually than ever the masters of the country, so that Britain was obliged to send an army next year, under Sir Ralph Abercromby, to accomplish, at an immense expense, and a great waste of human life, what the French had formerly agreed to do. In Europe, the presence of Bonaparte produced equally disastrous results. By one of his most dexterous movements, he eluded the Austrians, led an army over the Alps by the Great St Bernard into the Milanese, and having gained a decisive victory at Marengo (June 14), at once restored the greater part of Italy to French domination. Contemporaneously with Napoleon's movements, Moreau led another army directly into Germany, overthrew the Austrians in several battles, and advanced to within seventeen leagues of their capital, Vienna. These reverses obliged Austria next year (1801) to sue for and conclude a peace, by which France became mistress of all continental Europe west of the Rhine and south of the Adige.

## REBELLION IN IRELAND—UNION WITH GREAT BRITAIN.

Although the government had been able, in 1783, to procure a dissolution of the volunteer corps, the bulk of the Irish people continued to express the most anxious desire for such a reform in their Parliament as might render it a more just representation of the popular voice. Unable to yield to them on this point, Mr Pitt endeavoured to appease them by extending their commercial privileges; but his wishes were frustrated, chiefly by the jealousy of the British merchants. A strong feeling of discontent, not only with the government, but with the British connection, was thus engendered in Ireland.

The commencement of the revolutionary proceedings in France excited the wildest hopes of the Irish. Towards the close of the year 1791, they formed an association, under the title of the United Irishmen, comprehending persons of all religions, and designed to obtain 'a complete reform of the legislature, founded on the principles of civil, political, and religious liberty.' The government from the first suspected this association of meditating an overturn of the state, and took strong measures for keeping it in check. Acts were passed for putting down its meetings, and the secretary, Mr Hamilton Rowan, was tried, and sentenced to a fine and two years' imprisonment for what was termed a seditious libel. At the same time, some concessions to the popular spirit were deemed indispensable, and the Irish Parliament accordingly passed acts enabling Catholics to intermarry with Protestants, to practise at the bar, and to educate their own children.

On discovering that a treasonable correspondence had been carried on with France by some leading persons in the society of United Irishmen, the government was so much alarmed as to send (1794) a Whig lord-lieutenant (Earl Fitzwilliam) to grant further concessions; but ere anything had been done, the ministers were persuaded by the Protestant party to return to their former policy. The patriotic party now despaired of effecting any improvement by peaceable means, and an extensive conspiracy was entered into for delivering up Ireland to the French republic. The scheme was managed by a directory of five persons, and though half a million of men were concerned in it, the most strict secrecy was preserved. In December 1796, a portion of the fleet which had been fitted out by the French to co-operate with the Irish patriots, landed at Bantry Bay; but measures for a rising of the people not being yet ripe, it was obliged to return. Next year, the losses at Camperdown crippled the naval resources of France, and prevented a renewal of the expedition. Losing all hope of French assistance, the conspirators resolved to act without it; but their designs were betrayed by one Reynolds; and three other members of the directory, Emmett, Macnevin, and Bond, were seized. Notwithstanding the precautionary measures which the government was thus enabled to take, the Union persisted in the design of rising on a fixed day. Lord Edward Fitzgerald, another of its leaders, was then arrested, and being wounded in a scuffle with his captors, soon after died in prison. On the 21st of May 1798, Lord Castlereagh, secretary to the lord-lieutenant, disclosed the whole plan of insurrection, which had been fixed to commence on the 23d.

Though thus thwarted in their designs, and deprived of their best leaders, the conspirators appeared in arms in various parts of the country. Parties attacked Naas and Carlow, but were repulsed with loss. A large party, under a priest named Murphy, appeared in the county of Wexford, and took the city of that name. Slight insurrections about the same time broke out in the northern counties of Antrim and Down, but were easily suppressed. In Wexford alone did the insurgents appear in formidable strength. Under a priest named Roche, a large party of them met and defeated a portion of the government troops; but on a second occasion, though they fought with resolution for four hours, they were compelled to retreat. Another defeat at New

Ross exasperated them greatly, and some monstrous cruelties were consequently practised upon their prisoners. On the 20th of June, their whole force was collected upon Vinegar Hill, near Enniscorthy, where an army of 13,000 men, with a proportionate train of artillery, was brought against them by General Lake. They were completely overthrown and dispersed. From this time the rebellion languished, and in July it had so far ceased to be formidable, that an act of amnesty was passed in favour of all who had been engaged in it, except the leaders.

On the 22d of August, when the rebellion had been completely extinguished, 900 French, under General Humbert, were landed at Killala, in the opposite extremity of the country from that in which the insurgents had shown the greatest strength. Though too late to be of any decisive effect, they gave some trouble to the government. A much larger body of British troops, under General Lake, met them at Castlebar, but retreated in a panic. They then advanced to the centre of the country, while the lord-lieutenant confessed the formidable reputation which their countrymen had acquired, by concentrating an immensely disproportioned force against them. On the 8th of September, they were met at Carrick-on-Shannon by this large army, to which they yielded themselves prisoners of war.

During the ensuing two years, the British ministers exerted themselves to bring about an incorporating union of Ireland with Great Britain; a measure to which the Irish were almost universally opposed, but which, by the use of bribes and government patronage liberally employed amongst the members of the Irish legislature, was at length effected. From the 1st of January 1801, the kingdom of Ireland formed an essential part of the empire, on which was now conferred the name of the United Kingdom of Great Britain and Ireland. The act of Union secured to the Irish most of the commercial privileges which they had so long sought. Upon a comparison of the aggregate exports and imports of the two countries, Ireland was to raise two parts of revenue for every fifteen raised by Great Britain, during the first twenty years of the Union, after which new regulations were to be made by Parliament. One hundred commoners were to be sent by Ireland to the British (now called the Imperial) Parliament; namely, two for each county, two for each of the cities of Dublin and Cork, one for the university, and one for each of the thirty-one most considerable towns. Four lords spiritual, by rotation of sessions, and twenty-eight lords temporal, elected for life by the Peers of Ireland, were to sit in the House of Lords.

The Union, though, upon the whole, effected in a spirit of fairness towards Ireland, increased the discontent of the people, which broke out in 1803 in a new insurrection. Under Robert Emmet and Thomas Russell, a conspiracy was formed for seizing the seat of the vice-government, and for this purpose a great multitude of peasantry from the county of Kildare assembled (July 23) in Dublin. Disappointed in their attempt upon the castle, they could only raise a tumult in the streets, in the course of which Lord Kilwarden, a judge, and his nephew, Mr Wolfe, were dragged from a carriage and killed. The mob was dispersed by soldiery, and Emmet and Russell, being seized, were tried and executed.

#### CHANGE OF MINISTRY, AND PEACE OF AMIENS, 1801.

At the commencement of 1801, Britain had not only to lament this unexpected turn of fortune, but to reckon among her enemies the whole of the northern states of Europe, which had found it necessary to place themselves on a friendly footing with Bonaparte, and though they did not declare war against Britain, yet acted in such a manner as to render hostilities unavoidable. Nelson sailed in March with a large fleet for Copenhagen, and proved so successful against the Danish fleet, as to reduce that country to a state of neutrality. The death of the Russian Emperor Paul, which took place at the same time, and the accession of Alexander, who was friendly to Britain, completely broke up the

northern confederacy. Yet the great achievements of France on the continent, joined to the distresses of a famine which at this time bore hard on the British people, produced a desire for that peace which, a year before, might have been gained upon better terms. With a view, apparently, to save the honour of Mr Pitt and his friends, a new ministry was appointed under Mr Addington, by whom a peace was at length, in the end of the year (1801), concluded with France, which was left in the state of aggrandisement which has just been described.

The war of the French Revolution placed Great Britain in possession of a considerable number of islands and colonies in the East and West Indies and elsewhere; and while only two war ships had been lost on her part, she had taken or destroyed 80 sail of the line, 181 frigates, and 224 smaller ships, belonging to the enemy, together with 743 privateers, 15 Dutch, and 76 Spanish ships. The triumphs of the British fleets were indeed numerous and splendid, and had the effect of keeping the national commerce almost inviolate during the whole of the war, while that of France was nearly destroyed. There was, however, hardly the most trifling instance of success by land; and the expenses of the contest had been enormous. Previously to 1793, the supplies usually voted by the House of Commons were £14,000,000; but those for 1801 were £42,197,000—a sum about double the amount of the whole land-rent of the country.

#### WAR RENEWED WITH FRANCE, 1803.—SUBSEQUENT EVENTS.

It was only one of the results of the war against French independence, that France was led by the course of events to place herself under the control of her chief military genius, Napoleon Bonaparte; a man singularly qualified for concentrating and directing the energies of a country in the existing condition of France, but animated more by personal ambition than by any extended views of the good of his species. It was soon manifest that Bonaparte did not relish peace. By taking undue advantage of several points left loose in the treaty, he provoked Great Britain to retaliate by retaining possession of Malta; and the war was accordingly recommenced in May 1803. Britain immediately employed her superior naval force to seize the French West India colonies; while France took possession of Hanover, and excluded British commerce from Hamburg. Bonaparte collected an immense flotilla at Boulogne, for the avowed purpose of invading England; but so vigorous were the preparations made by the whole British population, and so formidable the fleet under Lord Nelson, that he never found it possible to put his design in execution. In the year 1804, he was elevated to the dignity of Emperor of the French; and France once more exhibited the formalities of a court, though not of the kind which the European sovereigns were anxious to see established. In April of the same year, the Addington administration was exchanged for one constructed by Mr Pitt, and of which he formed the leader.

In 1805, under the fostering influence of Great Britain, a new coalition of European powers, consisting of Russia, Sweden, Austria, and Naples, was formed against Napoleon. He, on the other hand, had drawn Spain upon his side, and was making great exertions for contesting with Britain the empire of the sea. A fleet of thirty-three sail, partly French and partly Spanish, met a British fleet of twenty-seven, under Nelson, off Cape Trafalgar, October 25, 1805, and was completely beaten, though at the expense of the life of the British commander. Britain thus fixed permanently her dominion over the seas and coasts of the civilised world. At this time, however, Napoleon was asserting with equal success his supremacy over continental Europe. By a sudden, rapid, and unexpected movement, he conducted an army into Germany, where the Austrians were already making aggressions upon neutral territory. On the 17th October, he took the fortress of Ulm, with its artillery, magazines, and gar-

rison of 30,000 men; a month after, he entered Vienna without resistance. He then pursued the royal family, and the allied armies of Russia and Austria, into Moravia; and on the 2d of December 1805, he gained the decisive and celebrated victory of Austerlitz, which put an end to the coalition, and rendered him the dictator of the continent.

This series of events caused much gloom in the British councils, and with several other painful circumstances, among which was the impeachment of his colleague Lord Melville, for malpractices in the Admiralty, proved a death-blow to Mr Pitt, who expired on the 23d of January 1806, completely worn out with state business, at the early age of forty-seven, half of which time he had spent in the public service. Mr Pitt is universally allowed the praise of high talent and patriotism. But his policy has been a subject of dispute between the two great political parties into which British society is divided. By the Tories it is firmly believed that his entering into the war against the French Republic was the means of saving the country from anarchy and ruin; by the Whigs, that this step only tended to postpone the settlement of the affairs of France, and loaded Britain with an enormous debt. Of the absence of all selfish views in the political conduct of Mr Pitt, there can be no doubt; for, so far from accumulating a fortune out of the public funds, he left some debts, which Parliament gratefully paid.

Mr Pitt's ministry was succeeded by one composed of Lord Grenville, Mr Fox, and their friends; it was comprehensively called Whig, although Lord Grenville was in every respect a Tory, except in his advocacy of the claims of the Catholics for emancipation. In the course of 1806, the new cabinet made an attempt to obtain a peace from France, which now threatened to bring the whole world to its feet. But the Grenville administration encountered serious difficulties from the king, who never could be induced to look with the least favour on the Catholic claims, or those who advocated them. Exhausted by his useless labours, Mr Fox died, September 13, 1806. Few names are more endeared to the British people than his, for, though the leader of the Whigs, he never excited any rancour in his opponents. He was remarkable for his frankness and simplicity. His abilities as a parliamentary orator and statesman were of the first order, and he was invariably the consistent and sincere friend of popular rights.

A new coalition, excluding Austria, but involving Prussia, had been subsidised by Britain, and was now preparing to act. With his usual decision, Napoleon led what he called his 'Grand Army' by forced marches into Prussia; gained, on the 14th of October, the battles of Jena and Auerstadt, which at once deprived that country of her army, her capital, and her fortresses; and then proclaimed the famous 'Berlin Decrees,' by which he declared Great Britain in a state of blockade, and shut the ports of Europe against her merchandise. The king of Prussia, Frederick William III., took refuge with his court in Russia, which now was the only continental power of any importance that remained unsubdued by France.

Towards that country Napoleon soon bent his steps, taking, as he went, assistance from Poland, which he promised to restore to independence. After a series of skirmishes and battles of lesser importance, he met the Russian army in great strength (June 14, 1807), at Friedland, and gave it a total overthrow. He might now have easily reduced the whole country, as he had done Austria and Prussia; but he contented himself with forming a treaty (called the treaty of Tilsit, from the place where it was entered into), by which Russia agreed to become an ally of France, and entered into his views for the embarrassment of Britain by the exclusion of her commerce from the continental ports. France had thus, in the course of a few years, disarmed the whole of Europe, excepting Great Britain, an amount of military triumph for which there was no precedent in ancient or modern history.

The Grenville administration was displaced in the

spring of 1807, in consequence of the difference between its members and the king on the subject of the Catholic claims, which had long been urged by the Whig party, with little support from the people. The next ministry was headed by the Duke of Portland, and included Lords Hawkesbury and Castlereagh (afterwards Earl of Liverpool and Marquis of Londonderry), and Mr Canning, as secretaries; Mr Spencer Perceval being chancellor of the exchequer. After being accustomed to the services of such men as Pitt and Fox, the people regarded this cabinet as one possessing comparatively little ability. One of its first acts was the despatch of a naval armament to Copenhagen to seize and bring away the Danish shipping, which was expected to be immediately employed in subserviency to the designs of France, and for the injury of Britain. The end of the expedition was easily obtained; but it was the means of lowering the honour of Britain in the estimation of foreign powers.

#### FIRST PENINSULAR CAMPAIGN—SUBSEQUENT EVENTS.

The retaliation of France, for the interferences of other powers with its Revolution, even supposing such retaliation justifiable, was now more than completed. Further measures could only appear as dictated by a desire of aggrandisement. But France was now given up to the direction of a military genius, who had other ends to serve than the defence of the country against foreign aggression or interference. The amazing successes of Napoleon had inspired him with the idea of universal empire; and so great was the influence he had acquired over the French, and so high their military spirit, that the attainment of his object seemed by no means impossible. There was a difference, however, between the opposition which he met with before this period, and that which he subsequently encountered. In the earlier periods of the war, the military operations of the European powers were chiefly dictated by views concerning the interests of governments, and in which the people at large felt little sympathy. Henceforth a more patriotic spirit rose everywhere against Napoleon: he was looked upon in England and elsewhere as the common enemy of humanity and of freedom; and every exertion made for the humiliation of France was animated by a sentiment of desperation, in which the governors and governed alike participated.

The Spanish peninsula was the first part of the prostrated continent where the people could be said to have taken a decidedly hostile part against Napoleon. He had there gone so far as to dethrone the reigning family, and give the crown to his elder brother Joseph. A sense of wrong and insult, mingled with religious fanaticism, raised the Spanish people in revolt against the French troops; and though their conduct was everywhere barbarous in the extreme, it was hailed in Britain as capable of being turned to account. In terms of a treaty entered into with a provisional government in Spain, a small army was landed, August 8, 1808, in Portugal, which had been recently taken possession of by the French. Sir Arthur Wellesley, who afterwards became so famous as Duke of Wellington, was the leader of this force. In an engagement at Vimeira, on the 21st, he repulsed the French, under Junot, who soon after agreed, by what was called the Convention of Cintra, to evacuate the country. Sir Arthur being recalled, the British army was led into Spain under the command of Sir John Moore; but this officer found the reinforcements poured in by Napoleon too great to be withstood, and accordingly, in the end of December, he commenced a disastrous, though well-conducted retreat towards the port of Corunna, whither he was closely pursued by Marshal Soult. The British army suffered on this occasion the severest hardships and losses, but did not experience a check in battle, or lose a single standard. In a battle which took place at Corunna, January 16, 1809, for the purpose of protecting the embarkation of the troops, Sir John Moore was killed.

Much of the public attention was about this time

engrossed by circumstances in the private life of the eldest son of the king. The Prince of Wales had been tempted, in 1796, by the prospect of having his large debts paid by the nation, to marry the Princess Caroline of Brunswick, for whom he entertained no real affection. Almost ever since the marriage, he had shown the most marked disrespect for his consort, who consequently lived separate from him, and was herself considered by many as not altogether blameless in her conduct as a matron.

In 1809, Austria was induced once more to commence war with France. Upwards of half a million of men were brought into the field, under the command of the Archduke Charles. Bonaparte, leaving Spain comparatively open to attack, moved rapidly forward into Germany, and, by the victory of Eckmühl, opened up the way to Vienna, which surrendered to him. After gaining a slight advantage at Essling, the archduke came to a second decisive encounter at Wagram, where the strength of Austria was completely broken to pieces. The peace which succeeded was sealed by the marriage of Napoleon to Maria Louisa, daughter of the emperor of Austria, for which purpose he divorced his former wife Josephine.

In the autumn of 1809, the British government despatched an armament of 100,000 men, for the purpose of securing a station which should command the navigation of the Scheldt. The expedition was placed under the command of the Earl of Chatham, elder brother of Mr Pitt, a nobleman totally unacquainted with military affairs on such a scale. The army, having disembarked on the insalubrious island of Walcheren, was swept off in thousands by disease. The survivors returned in December without having done anything towards the object for which they set out. This tragical affair became the subject of inquiry in the House of Commons, which, by a majority of 272 against 232, vindicated the manner in which the expedition had been managed.

SUCCESSSES OF WELLINGTON IN SPAIN.

A new expedition in Spain was attended with better success. Taking advantage of the absence of Napoleon in Austria, a considerable army was landed, April 23, 1809, under the command of Sir Arthur Wellesley, who immediately drove Soult out of Portugal, and then made a rapid move upon Madrid. King Joseph advanced with a considerable force under the command of Marshal Victor; and on the 28th of July, attacked the British and Spanish troops in a strong position at Talavera. The contest was obstinate and sanguinary; and though the French did not retreat, the advantage lay with the British. As this was almost the first success which Britain experienced by land in the course of the war, Sir Arthur Wellesley became the theme of universal praise, and he was elevated to a peerage, under the title of Viscount Wellington of Talavera. He was obliged immediately to fall back upon Portugal, where he occupied a strong position near Santarem.

Early in 1810, Napoleon reinforced the army in Spain, and gave orders to Massena to 'drive the British out of the Peninsula.' Wellington posted his troops on the heights of Bussaco—eighty thousand in number, including Portuguese—and there, on the 27th of September, was attacked by an equal number of French. Both British and Portuguese behaved well: the French were repulsed with great loss, and for the first time in the war, conceived a respectful notion of the British troops. Wellington now retired to the lines of Torres Vedras, causing the whole country to be desolated as he went, for the purpose of embarrassing the French. When Massena observed the strength of the British position, he hesitated; and ultimately, in the spring of 1811, performed a disastrous and harassed retreat into the Spanish territory.

It now became an object of importance with Wellington to obtain possession of the Spanish fortresses which had been seized by the French. On the 22d of April, he reconnoitred Badajos, and soon after laid siege to Almeida. Massena, advancing to raise the siege, was

met on fair terms at Fuentes d'Onoro, May 5, and repulsed. Almeida consequently fell into the hands of the British. General Beresford, at the head of another body of British forces, gained the bloody battle of Albuera over Soult, and thereby protected the siege of Badajos, which, however, was soon after abandoned. During the same season, General Graham, in command of a third body of troops, gained the battle of Barossa. At the end of a campaign, in which the French were upon the whole unsuccessful, Wellington retired once more into Portugal.

SIR F. BURDETT—THE REGENCY.

The exclusion of strangers from the House of Commons during the inquiries into the Walcheren expedition, had been made a subject of discussion in a debating club, the president of which was therefore committed to Newgate for a breach of privilege. Sir Francis Burdett, member for Westminster, made this proceeding the subject of some acrimonious remarks in a letter to his constituents, denying the right of the House of Commons to imprison without trial, and describing that body as 'a part of our fellow-subjects, collected together by means which it is not necessary for me to describe.' The letter was voted a libel on the House, and a warrant was issued by the speaker for committing Sir Francis to the Tower. Sir Francis, denying the legality of the warrant, resisted its execution by remaining in his own house, where he was protected from the officers by immense crowds of people. After suffering a kind of siege for two days, he was forcibly taken by a large train of soldiers, and lodged in the Tower. By these proceedings, the capital was convulsed for several days; and in the course of the tumults which took place, a number of lives were lost.

The intellect of the king, which had experienced several temporary aberrations, gave way at the close of the year 1810, and rendered the appointment of a regent unavoidable. Accordingly, in December, the Parliament imposed that duty upon the Prince of Wales, though under certain restrictions as to the appointment of officers, and other branches of the royal prerogative. The Tory party had not now the same reason to dread the accession of the prince which they had in 1789. His sentiments on the Catholic claims, originally favourable, had in 1804 experienced a decided change, which proved the means of alienating him from the Whigs, with whom Catholic emancipation was a leading principle. Though he did not at first show any disinclination to take his old friends into the ministry, he contrived, when the first year of restriction had elapsed, to let them remain in their wonted state of opposition, without seeming to have desired it.

EVENTS OF 1811, 1812, AND 1813.

The year 1811 was regarded as the period of greatest depression and distress which the British empire had known for several ages. At this time, with the exception of an uncertain footing gained in Spain, the influence of England was unknown on the continent. Bonaparte seemed as firmly seated on the throne of France as any of her former monarchs, while every other civilised European kingdom either owned a monarch of his express appointment, or was in some other way subservient to him. By the Berlin and Milan decrees, he had shut the ports of the continent against British goods, so that they could only be smuggled into the usual markets. By British orders in council, which, though intended to be retaliatory, only increased the evil, no vessel belonging to a neutral power—such, for instance, as the United States—was permitted to carry goods to those ports, unless they should previously land and pay a duty in Britain. Thus the nation at once suffered from the shortsighted despotism of the French emperor, and from its own narrow and imperfect views of commerce; for, by embarrassing America, it only deprived itself of one of its best and almost sole remaining customers.

The power of Bonaparte, though sudden in its rise,

might have been permanent if managed with discretion. It was used, however, in such a way as to produce a powerful reaction throughout Europe in favour of those ancient institutions, which, twenty years before, had been threatened with ruin. The exclusion of British goods—a measure which he had dictated in resentment against England—proved the source of great distress, oppression, and hardship throughout the continent, and was greatly instrumental in exciting a spirit of hostility against him. The very circumstance of a foreign power domineering over their native princes, raised a feeling in favour of those personages, which, being identified with the cause of national independence, acted as a very powerful stimulant. On the other hand, a sense of the grasping ambition of Napoleon—of his hostility to real freedom—of his unscrupulousness in throwing away the lives of his subjects for his own personal aggrandisement—had for some time been gaining ground in France itself.

In 1812, when the transactions in Spain had already somewhat impaired Napoleon's reputation, Alexander, Emperor of Russia, ventured upon a defiance of his decrees against British merchandise, and provoked him to a renewal of the war. With upwards of half a million of troops, appointed in the best manner, he set out for that remote country, determined to reduce it into perfect subjection. An unexpected accident defeated all his plans. The city of Moscow, after being possessed by the French troops in September, was destroyed by incendiaries, so that no shelter remained for them during the ensuing winter. Napoleon was obliged to retreat; but, overtaken by the direst inclemency of the season, his men perished by thousands in the snow. Of his splendid army, a mere skeleton regained central Europe. Returning almost alone to Paris, he contrived with great exertions to reinforce his army, though there was no replacing the veterans lost in Russia.

Early in 1813, he opened a campaign in northern Germany, where the emperor of Russia, now joined by the king of Prussia and various minor powers, appeared in the open field against him. After various successes on both sides, an armistice was agreed to on the 1st of June, and Bonaparte was offered peace on condition of restoring only that part of his dominions which he had acquired since 1805. Inspired with an overweening confidence in his resources and military genius, he refused these terms, and lost all. In August, when the armistice was at an end, his father-in-law, the emperor of Austria, joined the allies, whose forces now numbered 500,000 men, while an army of 300,000 was the largest which Napoleon could at present bring into the field. Henceforth he might be considered as overpowered by numbers. By steady, though cautious movements, the allies advanced to France, driving him reluctantly before them, and increasing their own force as the various states became emancipated by their presence. At the close of 1813, they rested upon the frontiers of France, while Lord Wellington, after two successful campaigns in Spain, had advanced in like manner to the Pyrenees.

#### HOME AFFAIRS.—WAR WITH AMERICA.

Some changes had in the meantime taken place in the British administration. On the 11th of May 1812, the premier, Mr Perceval, was shot in the lobby of the House of Commons, by a man named Bellingham, whom some private losses had rendered insane. Lords Liverpool and Castlereagh then became the ministerial leaders in the two Houses of Parliament, but were quickly voted down by a majority of four, upon a motion made by Mr Stuart Wortley, afterwards Lord Wharncliffe. The ministry was finally rendered satisfactory to Parliament by the admission of Earl Harrowby as president of the council, Mr Vansittart as chancellor of the exchequer, and Lord Sidmouth (formerly premier while Mr Addington) as secretary for the home department; Lord Liverpool continuing as premier, and Lord Castlereagh as foreign and war secretary.

Notwithstanding the successes which were at this

period brightening the prospects of Britain, the regent and his ministers did not enjoy much popularity. The regent himself did not possess those domestic virtues which are esteemed by the British people, and he had excited much disapprobation by the steps which he took for fixing a criminal charge upon his consort. The general discontents were increased by the effects of the orders in council, for prohibiting the commerce of neutral states. Vast multitudes of working people were thrown idle by the stagnation of manufactures, and manifested their feelings in commotion and riot. The middle classes expressed their dissatisfaction by clamours for parliamentary reform.

At this unhappy crisis, provoked by the orders in council, as well as by a right assumed by British war-vessels to search for and impress English sailors on board the commercial shipping of the United States, that country (June 1812) declared war against Britain. Before the news had reached London, the orders had been revoked by the influence of Lord Liverpool; but the Americans, nevertheless, were too much incensed to retrace their steps. During the summer and autumn, several encounters took place between single American and British ships, in which the former were successful. It was not till June 1, 1813, when the Shannon and Chesapeake met on equal terms, that the British experienced any naval triumph in this war with a kindred people. On land, the Americans endeavoured to annoy the British by assaults upon Canada, but met with no decisive success. The British landed several expeditions on the coast of the States; and were successful at Washington, at Alexandria, and at one or two other points, but experienced a bloody and disastrous repulse at New Orleans. The war ended, December 1814, without settling any of the principles for which the Americans had taken up arms. But while thus simply useless to America, it was seriously calamitous to Britain. The commerce with the States, which amounted in 1807 to twelve millions, was interrupted and nearly ruined by the orders in council, and the hostilities which they occasioned; henceforth America endeavoured to render herself commercially independent of Britain, by the encouragement of native manufactures—a policy not immediately advantageous perhaps to herself, but decidedly injurious to Great Britain. The fatal effects of the Berlin and Milan decrees to Napoleon, and of the orders in council to the interests of Britain, show how extremely dangerous it is for any government to interfere violently with the large commercial systems upon which the immediate interests of their subjects depend.

#### PEACE OF 1814—SUBSEQUENT EVENTS.

At the close of 1813, it was evident that Bonaparte could hardly defend himself against the vast armaments collected on all hands against him. Early in 1814, having impressed almost every youth capable of bearing arms, he opposed the allies on the frontiers with a force much less numerous and worse disciplined. Even now he was offered peace, on condition that he should only retain France as it existed before the Revolution. But this proposition was too humiliating to his spirit to be accepted; and he entertained a hope that, at the worst, his father-in-law, the emperor of Austria, would not permit him to be dethroned. Two months were spent in almost incessant conflict with the advancing allies, who, on the 30th of March, entered Paris in triumph; and in the course of a few days, ratified a treaty with Napoleon, by which he agreed to resign the government of France, and live for the future as only sovereign of Elba, a small island in the Mediterranean.

In the measures for settling France, Great Britain concurred by her representative Lord Castlereagh, who attended the allies during the campaign of 1814; and peace was proclaimed in London on the 20th of June. France was deprived of all the acquisitions gained both under the Republic and the Empire, and restored to the rule of the ancient royal family in the person of Louis XVIII. The emperor of Russia and the king of

Prussia visited England in June, and were received with all the honours due to men who were considered as the liberators of Europe. Wellington, now created a duke, received a grant of £400,000 from the House of Commons, in addition to one of £100,000 previously voted; and had the honour to receive in person the thanks of the House for his services. Representatives from the European powers concerned in the war met at Vienna, October 2, in order to settle the disturbed limits of the various countries, and provide against the renewal of a period of war so disastrous. Throughout the whole arrangements, Great Britain acted with a disinterested magnanimity, which, after her great sufferings and expenses, could hardly have been looked for, but was highly worthy of the eminent name which she bore amidst European nations.

In March 1815, the proceedings of the Congress were interrupted by intelligence that Napoleon had landed in France, and was advancing in triumph to the capital. He had been encouraged by various favourable circumstances to attempt the recovery of his throne; and so unpopular had the new government already become, that, though he landed with only a few men, he was everywhere received with affection, and on the 20th of March was reinstated in his capital, which had that morning been left by Louis XVIII. The latter sovereign had granted a charter to his people, by which he and his successors were bound to rule under certain restrictions, and with a legislature composed of two chambers, somewhat resembling the British Houses of Parliament. Bonaparte now came under similar engagements, and even submitted to take the votes of the nation for his restoration; on which occasion he had a million and a-half of affirmative, against less than half a million of negative voices, the voting being performed by ballot. His exertions to reorganise an army were successful to a degree which showed his extraordinary influence over the French nation. On the 1st of June he had 559,000 effective men under arms, of whom 217,000 were ready to take the field.

A Prussian army of more than 100,000 men, under Blucher, and one of about 80,000 British, Germans, and Belgians, under Wellington, were quickly rendezvoused in the Netherlands, while still larger armies of Austrians and Russians, making the whole force above 1,000,000, were rapidly approaching. These professed to make war, not on France, but against Bonaparte alone, whom they denounced as having, by his breach of the treaty, 'placed himself out of the pale of civil and social relations, and incurred the penalty of summary execution.' Napoleon, knowing that his enemies would accumulate faster in proportion than his own troops, crossed the frontier on the 14th of June, with 120,000 men, resolved to fight Blucher and Wellington separately, if possible. The rapidity of his movements prevented that concert between the Prussian and English generals which it was their interest to establish. On the 16th, he beat Blucher at Ligny, and compelled him to retire. He had at the same time intrusted to Marshal Ney the duty of cutting off all connection between the two hostile armies. His policy, though not fully acted up to by his marshals, was so far successful, that Blucher retired upon a point nearly a day's march from the forces of Wellington.

After some further fighting next day, Napoleon brought his whole forces to bear, on the 18th, against Wellington alone, who had drawn up his troops across the road to Brussels, near a place called Waterloo. The battle consisted of a constant succession of attacks by the French upon the British lines. These assaults were attended with great bloodshed, but nevertheless resisted with the utmost fortitude, till the evening, when Blucher came up on the left flank of the British, and turned the scale against the French, who had now to operate laterally, as well as in front. The failure of a final charge by Napoleon's reserve to produce any impression on the two armies, decided the day against him: his baffled and broken host retired before a furious charge of the Prussian cavalry, who cut them down

unmercifully. On his return to Paris, Napoleon made an effort to restore the confidence of his chief counsellors, but in vain. After a fruitless abdication in favour of his son, he retired on board a small vessel at Rochfort, with the intention of proceeding to America; but being captured by a British ship of war, he was condemned by his triumphant enemies to perpetual confinement on the island of St Helena, in the Atlantic, where he died in 1821.

Louis XVIII. was now restored, and the arrangements of the Congress of Vienna were completed. The expenses of Great Britain during this last year of hostilities exceeded seventy millions; and the national debt, which in 1793 had been £230,000,000, now amounted to the vast sum of £860,000,000.

During the latter years of Napoleon, a reaction had taken place throughout Europe against the innovatory doctrines which, by producing the French Revolution, had been the cause, innocent or guilty, of so much ruinous warfare. Encouraged by this sentiment, the sovereigns of Austria, Prussia, and Russia, had no sooner settled the new government of France, than they entered, September 26, 1815, into a personal league or bond for assisting each other on all occasions when any commotion should take place among their respective subjects. This treaty was composed in somewhat obscure terms; and from its professing religion to be the sole proper guide 'in the counsels of princes, in consolidating human institutions, and remedying their imperfections,' it obtained the name of the Holy Alliance. It was published at the end of the year, and communicated to the Prince Regent of England, who approved of, but did not accede to it.

The reaction had also its effect in Great Britain, in fixing the power of the aristocracy, which, by composing the whole of the Upper House, and influencing the election of a major part of the Lower, might be said to constitute the government. The security of this predominating power was indicated by several acts in which their peculiar interests were consulted. In the preceding year, an act had been passed for prohibiting the importation of grain from the continent, when the price in this country should be less than eighty shillings per quarter. An attempt to continue the income and property taxes, which pressed with the greatest severity on the wealthy and landed classes, was also negatived.

#### THE PRINCESS CHARLOTTE—POPULAR TUMULTS.

In May 1816, the Princess Charlotte, only child of the Prince Regent, was married to Prince Leopold of Saxe-Coburg, a young officer who had gained her affections when attending the allied sovereigns at the British court. In November 1817, to the inexpressible grief of the whole nation, the young princess died, immediately after having given birth to a dead son.

In August 1816, a British armament under Lord Exmouth bombarded Algiers, and reduced that piratical state to certain desirable conditions respecting the treatment of Christian prisoners.

The year 1816, and the four following years, will always be memorable as an epoch of extraordinary distress, affecting almost every class of the community. The liberation of European commerce at the end of the war produced a proportionate diminution of that trade which England had previously enjoyed, through her exclusive possession of the seas. While all public burdens continued at their former nominal amount, the prices of every kind of produce, and of every kind of goods, had fallen far below the unnatural level to which a state of war and of paper money had raised them; and hence the expenses of the late contest, which had never been felt in the fictitious prosperity then prevalent, came to press with great severity upon the national resources, at a time when there was much less ability to bear the burden. To complete the misery of the country, the crops of 1816 fell far short of the usual quantity, and the price of bread was increased to an amount more than double that which has since been the average rate.

Tumultuary proceedings took place in various parts of the country; and a desire for a reform in the House of Commons, which was supposed to be the only means of reducing the public expenditure, began to take deep root among the lower orders, and produced tumultuary excesses in the metropolis. The government then adopted expedients for counteracting the force of the popular spirit. They endeavoured to make it appear that an extensive conspiracy had been formed for the overthrow of the government. Of the four rioters charged with high treason, a conviction was obtained only against one. Such unanimity, however, prevailed between the ministry and the Parliament, that, at the close of February (1817), an act was passed for the suspension of the Habeas Corpus Act. A considerable number of persons were imprisoned, and detained for some time at the will of the ministers.

A temporary revival of prosperity occurred in 1818, but was quickly followed by renewed distress. In the autumn of 1819, the misery of the working-classes had reached its greatest height, and still parliamentary reform was demanded as the only measure which could permanently improve their prospects. On the 12th of July, at a public meeting in the unrepresented town of Birmingham, an attorney was elected to proceed to Westminster, and openly claim to be received as a member of Parliament. On the 16th of August, a vast body of operatives assembled at Manchester, in an open space of ground called St Peter's Field, for a similar purpose, though professedly to petition for parliamentary reform. As they came in regular array, bearing banners with inscriptions, the magistrates professed to consider the meeting as dangerous to the public peace, and accordingly, ere the proceedings were far advanced, a body of troops, consisting chiefly of yeomanry, dashed into the mass, trampling down many persons of both sexes under the horses' feet, and killing and wounding others with their sabres. The meeting was dispersed by these means, and Messrs Hunt and Johnston, the principal orators, were apprehended. The tragic nature of this event, and its appearing as an invasion of the popular right of meeting for redress of grievances, produced some marks of public resentment; but the magistrates who conducted the attack received the immediate and cordial thanks of the government.

When Parliament reassembled in November, there was an evident increase of attachment to the ministry; and, in addition to the strong measures already taken for suppressing popular discontent, acts were passed to suppress unstamped political publications, to prevent secret training to arms, and to restrict the right of calling a public meeting to magistrates.

The year 1819 was remarkable, among other things, for the provision made, by act of Parliament, for the resumption of cash payments at the bank.

On the 20th of January 1820, George III. died at Windsor, in his eighty-second year, without having experienced any lucid interval since 1810. The Prince Regent was immediately proclaimed as GEORGE IV.; but there was no other change to mark the commencement of a new reign. A few days after the decease of George III., the Duke of Kent, his fourth son, died suddenly, leaving an infant daughter, Victoria, with a very near prospect to the throne.

#### MISCELLANEOUS CIRCUMSTANCES FROM 1790 TO 1820.

Owing to the superiority of Britain at sea, she was able to preserve her commerce during the war, while that of France was comparatively ruined. This circumstance, combined with the remarkable effects of machinery in various manufactures, and the great improvements effected in agriculture, maintained the prosperity of the country during a contest which otherwise must have sunk her as low as it did Austria and Prussia. The value of the exports, which had been fifteen millions in 1760, and had only advanced to twenty in 1790, was, in 1802, *forty-six millions*.

This period is above all things memorable for the introduction of the use of steam in navigation. A

model vessel, with a small steam-engine on board, was tried in 1788 by Mr Patrick Miller of Dalswinton in Dumfriesshire. Soon after, a vessel on a larger scale was exhibited in perfect action on the Forth and Clyde Canal. The idea fell asleep for a few years, but was revived by Mr Fulton, an American, who, in 1807, set agoing a steam-vessel on the Hudson River, the first in the world which was regularly employed in conveying passengers. In 1812, Mr Henry Bell of Helensburgh launched a similar vessel on the Clyde, being the first seen in Europe; and from that period steam-vessels quickly became numerous. Their superiority, in propelling vessels without regard to wind or tide, was in time universally acknowledged; and ultimately they have been used in voyages across large oceans.

In this period, considerable efforts were made for the more general education of the people. Sunday schools, first suggested by Mr Raikes of Gloucester, overspread the whole country, and proved the means of instructing many children who otherwise would have remained altogether ignorant. A plan of teaching great numbers of children, by employing the best pupils as monitors or assistants, was originated by Dr Bell and Mr Joseph Lancaster, and widely introduced. Two great societies were formed for the purpose of setting up and supporting schools in the districts where they were most needed. This period also beheld the rise of various societies, whose object it was to send missionaries to convert the heathen in distant lands, and to disseminate Bibles both at home and abroad. Great efforts were at the same time made in Britain to put an end to slavery in the West India colonies.

The latter part of the reign of George III. was also distinguished by great improvements in the dress and social condition of the people. Old fashions gradually disappeared, and the more simple and agreeable costume of the present day came into use. In the year 1750, cooked hats, wigs, swords, and buckles, were generally worn, and all gentlemen used hair powder. From the year 1790 to about 1800, these and many other oddities completely disappeared. Speedy travelling by stage-coaches, and the rapid transmission of letters by mail-carriages, became at the same time general in all parts of the United Kingdom.

At no period did a more brilliant class of literary men exist. Poetry assumed new and attractive forms in the works of Campbell, Moore, Southey, Wordsworth, Byron, and Scott. The novel or fictitious tale was advanced to a dignity it had never known before, in consequence of the production, by Sir Walter Scott, of a series of such compositions, in the highest degree dramatic and entertaining. In the Edinburgh and Quarterly Reviews, periodical criticism acquired an importance it never before possessed. At the same time, the more grave walks of divinity, history, and travels, were filled by a respectable body of writers. The name of Sir Humphry Davy stands pre-eminently in science, which was also cultivated with distinguished success by Wollaston, Leslie, Playfair, and Robison. In philosophical literature, the names of Dugald Stewart and Thomas Brown merit peculiar respect.

#### REIGN OF GEORGE IV.

At the time when George IV. commenced his reign, the Manchester affair and the recent proceedings of the ministry, had inspired a small band of desperate men with the design of assassinating the ministers at a cabinet dinner, and thereafter attempting to set themselves up as a provisional government. On the 23d of February 1820, they were surprised by the police in their place of meeting, and, after a desperate resistance, five were seized, among whom one Thistlewood was the chief. These wretched men were tried for high treason, and executed. Nearly about the same time, an attempt was made by the workmen in the west of Scotland to bring about some alteration in the state; and two men were executed.

On the accession of the king, his consort's name had been omitted from the liturgy. This and other indig-

nities induced her to return from a voluntary exile in Italy, June 1820, to the great embarrassment of the king and his ministers. Her majesty, who had long been befriended by the Opposition, was received by the people with the warmest expressions of sympathy. Whatever had been blameable in her conduct was overlooked, on account of the greater licentiousness of life ascribed to her husband, and the persecutions which she had suffered for twenty-four years. The king, who had established a system of observation round her majesty during her absence from the country, caused a bill of pains and penalties against her to be brought (July 6) into the House of Lords, which thus became a court for her trial. Messrs Brougham and Denman, who afterwards attained high judicial stations, acted as counsel for her majesty, and displayed great dexterity and eloquence in her defence. The examination of witnesses occupied several weeks; and nothing was left undone which might promise to confirm her majesty's guilt. But no evidence of criminality could soften the indignation with which almost all classes of the community regarded this prosecution. Though the bill was read a second time by a majority of 28 in a house of 218, and a third time by 108 against 99, the government considered it expedient to abandon it, leaving the queen and her partisans triumphant.

In July 1821, the coronation of George IV. took place under circumstances of great splendour. On this occasion, the queen made an attempt to enter Westminster Abbey, for the purpose of witnessing the ceremony, but was repelled by the military officers who guarded the door; an insult which gave such a shock to her health, as to cause her death in a few days. During the month of August, the king paid a visit to Ireland, where he was received with much cordiality by all classes of that excitable people, notwithstanding his known hostility to the Catholic claims. In September, he paid a visit to the kingdom of Hanover. In August of the ensuing year, he completed this series of visits by a voyage to Scotland, where, owing to the novelty of the occasion, and the historical associations which it was the means of awakening, he was also received with extreme kindness. During his absence in Scotland, his leading minister, the Marquis of Londonderry (formerly Lord Castlereagh), put an end to his own life, in consequence of a morbid sense of the difficulty of his position in regard to continental affairs. The successor of the Marquis of Londonderry in the direction of foreign affairs was Mr George Canning, who had quitted the cabinet two years before on account of the prosecution of the queen, and was at this time preparing to leave the country as governor-general of India. Mr Canning was a statesman of enlightened and humane spirit, and among other popular qualities, possessed a rich and classical style of parliamentary eloquence.

JOINT-STOCK MANIA—COMMERCIAL EMBARRASMENTS.

The two ensuing years were characterised by an extraordinary activity in almost all departments of trade and commerce. Mr Huskisson, an able commercial minister introduced by Mr Canning, originated several measures highly important; especially the repeal of all duties on goods passing between Great Britain and Ireland—an alteration in the duties affecting the silk manufacture—the repeal of the combination laws, and of the law against the emigration of artisans; while the executive formed commercial treaties, on the reciprocity system, with various countries of Europe; and, acknowledging the independence of the revolted Spanish colonies in America, drew them as additional customers into the British market.

Capital now so far exceeded the ordinary means of its employment, that many joint-stock companies were formed, as a means of giving it a wider range than that to which it was usually limited. Some of these associations professed objects which were by long-established usage the proper business of individuals alone, and others involved hazardous and visionary projects, which were to be carried into effect in remote countries. The

depressed state of trade in 1821 and 1822, had led to a diminished importation and production of goods, and been succeeded by an advance of prices in 1823. The consequence was a sudden and unusually active demand, and a powerful reaction of supply, which did not cease till production had far exceeded the bounds of moderation. Through the facilities afforded by large issues of paper money, the delusion was kept up longer than it would otherwise have been. The first symptom of something being wrong, was the turning of the exchange against England. A diminution of issues at the bank followed. Merchants began to feel a difficulty in answering pecuniary obligations. Then took place a run upon the banks, some of which, both in London and in the country, were obliged to stop payment. Between October 1825 and February 1826, fifty-nine commissions of bankruptcy were issued against English country banks, and four times the number of private compositions were calculated to take place during the same period. While the merchant and manufacturer were without credit, their inferiors were without employment, and distress reached almost every class of the community. Some liberal pecuniary measures on the part of the Bank of England, helped in a short time, rather by inspiring confidence than by actual disbursement of money, to retrieve in some measure the embarrassed circumstances of the country.

CANNING'S ADMINISTRATION—CATHOLIC EMANCIPATION.

In the spring of 1827, the illness of Lord Liverpool (followed soon after by his death) opened the way for Mr Canning's promotion to the first place in the administration; on which occasion, for various reasons of a personal as well as political character, the more uncompromising class of Tories resigned their places, leaving the reins of government in the hands of a comparatively popular party. Mr Canning, however, sank under the new load imposed upon him, and died in the ensuing August. His friend Lord Goderich succeeded as premier; but resigned in January 1828, when the Duke of Wellington was appointed in his place, with Mr (afterwards Sir) Robert Peel as secretary for the home department.

From the year 1805, the Catholic claims had been a prominent subject of parliamentary discussion, and since 1821 they had been sanctioned by a majority in the House of Commons. Almost despairing of their cause, while left to the progress of mere opinion in the English aristocracy, the Irish Catholics had in 1824 united themselves in an Association, with the scarcely concealed purpose of forcing their emancipation by means of a terrifying exhibition of their physical strength. An act was quickly passed for the suppression of this powerful body; but it immediately reappeared in a new shape. In fact, the impatience of the Catholic population of Ireland under the disabilities and degradation to which they were subjected on account of religion, was evidently becoming so very great, that there could be little hope of either peace or public order in that country till their demands were conceded. Though the English public lent little weight to the agitation, and the king was decidedly hostile to its object, Catholic emancipation rapidly acquired importance with all classes, and in all parts of the empire. In the spring of 1828, a kind of preparation was made for the concession, by the repeal of the test and corporation oaths, imposed in the reign of Charles II.

The ministry soon after received an alarming proof of the growing force of the question. Mr Vesey Fitzgerald had vacated his seat for the county of Clare, on becoming president of the Board of Trade. He was a friend to emancipation, and possessed great influence in the county; but he was also a member of an anti-Catholic administration. As an expedient for annoying the ministry, the Catholic Association, and all the local influences on that side, were set in motion to procure the return of Mr Daniel O'Connell, the most distinguished orator of the Catholic party. To the surprise of the nation, Mr O'Connell was returned by a great

majority. It was even surmised that the laws for the exclusion of Catholics from Parliament would be unable to prevent him from taking his seat. The Duke of Wellington now began to see the necessity of taking steps towards a settlement of this agitating question; and the first, and most difficult, was to overcome the scruples of the sovereign. At the opening of the session of 1829, in consequence of a recommendation from the throne, bills were introduced by ministers for removing the civil disabilities of Catholics, and putting down the Catholic Association in Ireland; and notwithstanding a great popular opposition, as well as the most powerful exertions of the older and more rigid class of Tories, this measure was carried by a majority of 353 against 180 in the House of Commons, and by 217 to 112 in the House of Lords.

REIGN OF WILLIAM IV.

The agitations respecting the Catholic Relief Bill had in some measure subsided, when, June 26, 1830, George IV. died of ossification of the vital organs, and was succeeded by his next brother, the Duke of Clarence, under the title of WILLIAM IV. About a month after, a great sensation was produced in Britain by a revolution which took place in France, the main line of the Bourbon family being expelled, and the crown conferred upon Louis-Philippe, Duke of Orleans. By this event, a great impulse was given to the reforming spirit in Britain, and the demands for an improvement in the parliamentary representation became very strong. The consequence was the retirement of the Wellington administration in November, and the formation of a Whig cabinet, headed by Earl Grey. The agitations of the time were much increased by a system of nocturnal fire-raising, which spread through the south of England, and caused the destruction of a vast quantity of agricultural produce and machinery.

The Whig ministry came into power upon an understanding that they were to introduce bills for parliamentary reform, with reference to the three divisions of the United Kingdom. These, when presented, in March 1831, were found to propose very extensive changes, particularly the disfranchisement of boroughs of small population, for which the members were usually returned by private influence, and the extension of the right of voting in both boroughs and counties to the middle classes of society. The bills accordingly met with strong opposition from the Tory, now called the Conservative party. By a dissolution of Parliament, the ministry found such an accession of supporters as enabled them to carry the measure through the House of Commons with large majorities; but it encountered great difficulties in the House of Lords; and it was not till after a temporary resignation of the ministry, and some strong expressions of popular anxiety respecting reform, that the bills were allowed to become law.

During the few years which followed the passing of the Reform Bills, the attention of Parliament was chiefly occupied by a series of measures which a large portion of the public deemed necessary for improving the institutions of the country, and for other beneficial purposes. The most important of these, in a moral point of view, was the abolition of slavery in the colonies, the sum of twenty millions being paid to the owners of the negroes, as a compensation for resigning a right of property which had long been a disgrace to humanity. By this act, eight hundred thousand slaves were (August 1, 1834) placed in the condition of freemen, but subject to an apprenticeship to their masters for a few years.

In the same year, an act was passed for amending the laws for the support of the poor in England, which had long been a subject of general complaint. One of the chief provisions of the new enactment established a government commission for the superintendence of the local boards of management, which had latterly been ill-conducted, and were now proposed to be reformed. The able-bodied poor were also deprived of the right which had been conferred upon them at the end of the eighteenth century, to compel parishes to

support them, either by employment at a certain rate, or pecuniary aid to the same amount: they were now left no resource, failing employment, but that of entering poor-houses, where they were separated from their families. The contemplated results of this measure were a reduction of the enormous burden of the poor-rates, which had latterly exceeded seven millions annually, and a check to the degradation which indiscriminate support was found to produce in the character of the labouring-classes.

On the renewal of the charter of the East India Company in 1834, the government deprived it of its mercantile privileges, and extended the right of trading with China to the community at large. The ancient policy of not allowing Europeans to settle in Hindoostan was also departed from, under some restrictions of inferior importance. Some reforms, equally advantageous to the public, were effected in the administration of the law, and in the privileges held by the Bank of England.

In 1833, a reform took place in the mode of electing the councils and magistracies of the Scottish boroughs. Instead of regulations which took their rise in an early age, and had been found productive of mismanagement, the parliamentary constituencies were empowered, in all except a few cases, to choose the requisite number of councillors, to whom then belonged the duty of appointing the requisite number out of their own body to act as magistrates. In 1835, the English municipal corporations were reformed, upon a principle similar to that applied to Scotland, except that the rate-payers and freemen were designed to form the electoral bodies, and that the councils in most cases were to consist of a greater number of members. A modified reform of the same nature took place in Ireland, by virtue of an act passed in 1840.

During the summer of 1834, the ministry endeavoured to carry through Parliament a bill to enable them to take unusual measures for restraining turbulence in Ireland. In consequence of a difficulty experienced in passing the measure, Lord Althorp and Earl Grey resigned their situations. The latter, who had now passed his seventieth year, was anxious for other reasons to retire from more active life, in order to spend the remainder of his days in the bosom of his family. He withdrew with the admiration of all parties, his whole career having been marked by consistency and sincerity. His place was supplied by Viscount Melbourne, and Lord Althorp was induced to resume office. The Irish Coercion Bill, with certain modifications, was then passed.

In November, the death of Earl Spencer caused the advancement of his son Lord Althorp to the House of Peers, and the ministry was then left without a leader in the House of Commons. The king, who had for some time inclined to the Conservative party, took advantage of this circumstance to dissolve the cabinet. The Duke of Wellington was again called into office, and a messenger was despatched to Italy to bring Sir Robert Peel home from that country, in order to accept the premiership. Sir Robert hastened to London, and on the 10th of December, the new ministry was constructed, chiefly of the individuals who lost office in 1830. Sir Robert, though sensible of the difficulty of conducting public affairs at such a time, resolved to do the utmost to conciliate popular favour, by entering upon reforming measures. In a new House of Commons, his party was strengthened by nearly a hundred new votes; but he was still in a minority. After bringing forward a variety of measures of a reforming character, being defeated on the question of devoting some part of the Irish church revenues to education, he was compelled to resign (April 6, 1835), and allow the Melbourne ministry to be replaced.

In the session of 1836, the ministry were defeated, by majorities in the House of Lords, in attempts to carry several important measures of reform, but succeeded in passing an act for commutating tithes in England into a corn-rent charge payable in money; also in an act for enabling dissenters in England to be married other-

wise than by the established clergy; and another for a general registry of births, deaths, and marriages. They likewise reduced the stamp-duty on newspapers to one penny, by which the circulation of that class of publications was very largely increased. From this time, there was a marked diminution in the zeal which had for some years been manifested for changes in the national institutions. Early in 1837, the ministry again introduced into the House of Commons a bill for settling the Irish tithe question; but before this or any other measure of importance had been carried, the king died of ossification of the vital organs (June 20), in the seventy-third year of his age, and seventh of his reign, being succeeded by his niece, the PRINCESS VICTORIA. The deceased monarch is allowed to have been a conscientious and amiable man, not remarkable for ability, but at the same time free from all gross faults.

COMMENCEMENT OF THE PRESENT REIGN.

Queen Victoria began to reign June 20, 1837, having just completed her eighteenth year; was crowned on the 28th of June in the following year; and was married to her cousin, Prince Albert of Coburg and Gotha, February 10, 1840. This union has now (February 1849) been followed by the birth of two princes and four princesses—thus giving new security to the continuance of the present dynasty. In the autumns of 1842, '44, '47, and '48, her majesty visited Scotland, but on each occasion more in a private than in a state capacity; residing at the mansions of the nobility that lay in her route to the Highlands, where the Prince Consort enjoyed the invigorating sports of grouse-shooting and deer-stalking. In 1843 she paid a visit, entirely divested of state formalities, to the late royal family of France; and shortly after made another to her uncle, the king of the Belgians. In 1845, besides making the tour of the English midland counties, the royal pair visited the family of Prince Albert at Coburg and Gotha; receiving the attentions of the various German powers that lay on their outward and homeward route. Her majesty has received in turn the friendly visits of several crowned heads, among whom have been the ex-king of the French, Leopold of Belgium, the king of Saxony, and the emperor of Russia. Such interchanges and attentions are not without their importance; at all events they are characteristic of a new era in the international history of Europe.

The Whig ministry and measures, which had for some time been on the decline, were set aside by a vote of 'no confidence' in the summer of 1841; a dissolution of Parliament was the consequence; and after the new elections, the Opposition was found to be so far in the ascendancy, that Viscount Melbourne tendered his resignation, and retired from public life, leaving Sir Robert Peel again to take the helm of affairs. The Parliament of 1841, under the direction of the Peel ministry, was in many respects one of the most important during the reigning dynasty. Besides passing several measures of benefit to the internal management of the country, it established, by the abolition of the corn-laws and other restrictive duties, the principles of free trade, and in that course Britain has since been followed by other nations; it gave, by the imposition of a property and income tax, a preference to the doctrine of direct taxation; it countenanced in all its diplomatic negotiations the duties and advantages of a peace policy; and engaged less with political theories than with practical and business-like arrangements for the commerce, health, and education of the country. In consequence of ministerial differences, Sir Robert Peel tendered his resignation as premier in June 1846, and was succeeded in office by Lord John Russell, to whom was assigned the further task of carrying out the principles of free trade, of legislating for Ireland in a time of dearth and famine (caused by successive failures of the potato crop), and of adopting some plan of national education—a subject which has been too long neglected in this otherwise great and prosperous empire.

Since the accession of her majesty, Britain has been

on the most friendly terms with the other nations of Europe—co-operating with them in the extension and liberation of commerce, the continuance of peace, the suppression of slavery, and the advancement of other measures of importance to civilisation; and it is fondly hoped that the recent and still unsettled constitutional changes in France, Germany, Austria, and Italy, will not affect in any material degree this gratifying progress of peace and social improvement. In the East, a short, but somewhat cruel war with China has opened up a new and more liberal system of trade with that country; an unnecessary aggression upon Afghanistan was followed by a disastrous defeat of our troops, and their subsequent withdrawal from that country; and an extension of British rule has taken place in India after several severe battles with the forces of the Sikh territory. The disputed boundaries between British America and the United States have been determined by friendly negotiation; thus giving permanency in the new world as well as in the old to the spirit of peace and national brotherhood.

MISCELLANEOUS CIRCUMSTANCES FROM 1820 TO 1849.

This period is remarkable for the great efforts which were made to diffuse knowledge more generally amongst the people. *Mechanics' Institutions* were formed in most of the larger towns, for the instruction of that class of the community in mechanical and natural science. Various periodical works of a cheap nature were also set agoing, for the purpose of communicating science and other branches of knowledge, in such forms as to be intelligible to the less educated classes. At the same time, considerable efforts were made by means of ordinary schools, schools of design, philosophical associations, and the like, to extend still further the benefits of education. Amongst the individuals who sought to promote these objects, the most conspicuous was Lord Brougham, who filled the office of Lord Chancellor in the Grey administration. Important progress was also made in the matter of public health: the erection of baths, the laying out of parks for recreation, the enforcement of better sewerage, the prohibition of underground dwellings, and the dissemination of sounder views as to cleanliness and ventilation, being features peculiar to the period. Great improvement was likewise effected in our prison discipline by the erection of appropriate jails, and a careful classification and treatment of criminals; while, with a view to lessen juvenile depravity, Industrial Schools were established in many of the more populous towns.

In this period, also, the national energies were chiefly turned towards the arts of peace, and accordingly the prosperity of the country made, upon the whole, great advances. Though agricultural produce had ceased to bring the high prices it realised during the war, the farmers paid equally high, or even higher rents; and this they were enabled to do in consequence of the soil having been so much improved by draining, manuring, and the introduction of more scientific modes of culture. During this period, steam navigation, both coast-wise and to foreign parts, was immensely increased; ordinary roads were improved by the mode of paving invented by Mr Macadam; railways began to over-spread all parts of the country, for the conveyance of goods and passengers, by means of steam locomotives, the ordinary speed of which is upwards of thirty miles an hour; the electric telegraph was put in operation; iron was extensively applied to ship-building, especially to the construction of steamers; machinery of every description was much improved, and its application extended to almost every known process. The last twenty years have also been marked by considerable social advancement; for although discontent and outbreaks have occurred in certain localities, in consequence of occasional stagnation in trade, the dearth of provisions, and supposed political grievances, yet the general aspect of the country has been one of peace and progress, tending to a diminution of the graver crimes, and to more correct views both as to moral and physical relations.

# CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

THE British Empire consists of the United Kingdom of Great Britain and Ireland (including a number of minor islands around their shores), and of several colonies and other dependencies in different quarters of the world.\* The most remarkable peculiarity in the political condition of the British Empire, is the high degree of civil and religious liberty which all classes of subjects practically enjoy. Slavery exists in no quarter of the British dominions: personal freedom, with liberty to come and go, unquestioned and unimpeded, is assured to all, without respect of birth, rank, profession, language, colour, or religion.

Britain, while in population and some other respects surpassed by several other nations, possesses a degree of wealth and political influence which may be said to place her at the head of all nations. This unprecedented affluence and power appears to have taken its rise in a fortunate concurrence of favouring circumstances, some of a physical and others of a moral character. The first of the physical causes in importance is unquestionably the insular situation, at once protecting the country from the destructive invasions which have so much depressed and retarded many continental states, and furnishing opportunities for a ready commerce with all the shores of the civilised world. The second of these causes is to be found in the natural fertility of a large portion of the United Kingdom, and the temperate climate enjoyed by it, favouring the production of the food necessary for a large population. A third cause is the large amount of her mineral and metallic stores, furnishing her with the means of prosecuting manufactures to an extent beyond all which the world has ever before had experience of. Thus Britain has been naturally qualified to become the seat of a great agricultural, manufacturing, and commercial nation, and must always, from the nature of things, have tended to assume that character. Moral causes, likewise, have had a powerful effect. The stock of the British population happens to have sprung from the Teutonic branch of the Caucasian variety of the human species, which has in many countries proved the superiority of its intellectual and moral organisation. The idea of trial by jury, and of arranging public affairs by a representative body, hit upon at an early period by this race, show that it possesses a natural aptitude for forming improved political institutions. Its connection with most of the important inventions of modern times shows its ingenuity in the arts. Its maritime enterprise and mercantile intrepidity were testified at a time when other nations were engaged only in feudal broils. Planted in England in the fifth century, and probably in Scotland many centuries before, we see this people making a continual advance ever since in political institutions and in the arts of peace. Historians point out the accidents which effected conspicuous changes; but while the feebleness and wickedness of a John may have been the immediate cause of the Magna Charta, and the passions of Henry VIII. the proximate cause of the reformation of religion, there must have also been something in the people pressing them irresistibly towards liberty of person and of conscience, and enabling them to overcome all obstacles to the accomplishment of those objects. It was in the nature of the people to establish free institutions—and they were established. A people so active and so ingenious could not fail to take advantage of the natural facilities which they enjoyed for manufactures and commerce. They made the

\* For an account of the physical features, natural products, political and civil divisions of Great Britain and her dependencies, the reader is referred to the GEOGRAPHICAL NO. from 63 to 70 inclusive.

best of blades in the days of Cœur de Lion, and in the time of Elizabeth their sails whitened every neighbouring sea. Arts, driven out of other countries by ruthless bigotry, found refuge and flourished amongst a people who eagerly grasp at every kind of employment which promises to be useful. It is to their persevering industry, exercised by favour of so many natural circumstances, and constantly protected by free institutions, that we are mainly and most immediately to look for the source of the greatness of the British Empire.

## FORM OF GOVERNMENT.

The government of the United Kingdom is constitutional, or possesses a regular form, in which the civil rights of all classes are acknowledged and guaranteed. The constitution is a monarchy, in which the sovereign accepts of his dignity under an express agreement to abide by certain prescribed forms of government according to the laws of the realm, and to maintain inviolate the Protestant religion, with all the rights and privileges of the church. The sovereign is the head or directing power in the executive of government, the fountain of all honours, and the watchful guardian of the interests of the state: he is held to be incapable of doing wrong; and if an unlawful act is done, the minister instrumental in that act is alone obnoxious to punishment. The legislative part of the government is composed of two deliberating bodies—the House of Lords and the House of Commons, both of which consist of individuals belonging to the United Kingdom only, the colonial dependencies of the empire having no share in the general management.

The persons who compose the *House of Lords* form a separate class or rank, which is called collectively the Peerage, whose members enjoy certain exclusive privileges and honours. The members of the House of Lords are either lords spiritual or temporal. The spiritual lords are archbishops and bishops, and hold their seats for life in virtue of their ecclesiastical office; the temporal lords enjoy their seats from hereditary right, or in virtue of being elevated to the peerage. In 1848, the number of members of the House of Lords was 438—namely, 2 princes of the blood royal, 2 English archbishops, 20 dukes, 17 marquises, 115 earls, 20 viscounts, 24 English bishops, 4 Irish prelates, 192 barons, 16 representative peers of Scotland, and 26 representative peers of Ireland. The House of Lords is liable at all times to an increase of number by the elevation of commoners to the peerage; but this prerogative of the crown is sparingly used. The number also fluctuates in consequence of there usually being several minors among the hereditary peers; at present, for instance, there are fourteen under age.

The *House of Commons* consists at present (February 1849) of 656 members; of whom 253 are chosen by counties, 6 by universities, and 397 by cities, boroughs, and towns. England returns 469, Wales 29, Ireland 105, and Scotland 53. The number of persons entitled to vote in the election of these members is above a million; of whom about 620,000 vote for county members, 5000 for representatives of universities, and 440,000 for members for cities, boroughs, and towns. The great bulk of the voters, as settled by the Reform Act of 1832, is composed of the agricultural tenantry and the occupants of houses of £10 of yearly rent; in other words, the middle classes. The operative classes, on account of not in general inhabiting houses of such value, possess little direct influence in the election of members of the House of Commons. The qualifications of an elector in counties are—a title to have voted on a freehold qualification before the passing of the Reform Act, the possession of freehold property to the value

of 40s. annually, or of land in copyhold of the clear annual value of ten pounds, the possession of land or houses of ten pounds annual value in property, or of a lease of not less than sixty years in England, and fifty-seven in Scotland, and the occupation of lands or tenements in England for any period, and in Scotland for nineteen years, at an annual rent of not less than fifty pounds. The qualification of an elector in boroughs is the occupation of a house of ten pounds annual rent; the resident freemen in English and Irish boroughs being also allowed to vote. A House of Commons cannot legally exist for more than seven years; but, in reality, it rarely exists so long; the death of the sovereign, change of ministry, and other circumstances, causing a renewal on an average every three or four years. Reckoning from 1802 till November 1847, there were fifteen Houses of Commons; as the fifteenth still exists (February 1849), we have an average of three years for each: those of longest duration were the fourth, from 1807 to 1812; the fifth, from 1812 to 1818; and the fourteenth, from 1841 to 1847.

The Houses of Lords and Commons compose the *Parliament*. The Parliaments of England and Scotland were united in 1707, and then called the British Parliament. In 1800, the Irish Parliament merged in the British Parliament. The three kingdoms were first represented in one Parliament in 1801. Since that period it has been entitled the *Imperial Parliament*, and is always convened at Westminster.

The two Houses, with the sovereign, compose the three estates of the realm, or legislative body. The sovereign takes no personal concern in the proceedings of Parliament, further than opening or proroguing the sessions; but the interests of the crown in Parliament are intrusted to members of the cabinet council or ministry, and by them are defended and explained. The two Houses, with the sovereign, have the power to pass laws, impose taxes, borrow money, make inquiries into the management of the public revenues, or the transactions of the great officers of government, and even to bring the latter to trial, if necessary. Members of either House inquire into the manner in which all great public institutions or boards of management are conducted, such as those for education, for purposes of charity, for the erection of lighthouses on the coast, for the construction of harbours, and generally, indeed, into all the business which is intrusted to the executive part of the government; they cannot direct what is to be done, but may always make scrutiny into it afterwards, if any error or mismanagement has taken place. The discussions on these subjects are often very warm and eager, and bring to light facts of great public importance. No act of the two deliberative bodies becomes valid as a law without the assent of the sovereign; and all propositions relating to money to be raised for the public service, must originate with the House of Commons, the Lords merely giving their assent as a matter of form, without being allowed to alter anything. This circumstance gives a much larger share of influence to the Commons than is possessed by the Lords; the former having it in their power, when dissatisfied with the measures of government, to stop the supplies of money, and thus bring the whole machinery to a stand.

Each of the two Houses has one presiding member, whose duty it is to preserve order and see that the regulations of the assembly are attended to by the members; he is also the person through whom any communication passes between the House and the Queen, he alone having the privilege of addressing her majesty in name of the House. Hence, in the House of Commons, this officer is called the *Speaker*; in the House of Lords he is commonly known as the *Lord Chancellor*, from another office which he holds; but the duties of the latter are quite the same as those of the Speaker of the Commons. There are numerous forms established for the regularity of business in Parliament, but of these there are only a few which need be mentioned here. Any proposal which is laid before either of the Houses, in order to pass into a law, must be made out by its

promoter in the form of an act of Parliament, but is only known by the name of a *bill* while under discussion: permission must first be obtained to introduce the bill, and it must then be read and considered by the House three several times, besides being once scrutinised more closely by a committee or select number of the members, and, if a public bill, by the whole House sitting as a committee, when each member is permitted to speak as frequently as he sees occasion, whereas in the regular sittings of the House no one is allowed to speak more than once, except to explain where his first statements have been misunderstood. If it is not rejected in any of these three readings, or given up in the committee, the bill is said to have passed. It must then go through the same process in the other House, where it is sometimes adopted, sometimes rejected; but if any alterations are made on it here, they must be reported to the House where it first originated. If the two cannot agree on the changes proposed, the bill falls to the ground; but some modification is generally contrived which satisfies both parties. It still remains to obtain the sanction of the sovereign, which is hardly ever refused, after which the *bill* becomes an *act of Parliament* or *law*.

The members of both Houses have certain personal privileges, which are deemed necessary for enabling them properly to attend to their public duties. In Parliament, they enjoy absolute freedom of speech, and cannot be questioned out of the House for anything said in the debates; they and their servants are exempted from arrest (except in criminal cases) during their attendance in Parliament.

The *Executive*, as already stated, is reposed in the hands of a sovereign. The dignity of the sovereign is hereditary in the family of Brunswick, now on the throne, and in the person of either a male or female. A queen reigning, therefore, enjoys the same privileges as a king. Besides enforcing the laws of the realm, through the medium of courts of justice, and a variety of functionaries, the sovereign is charged with the office of levying taxes granted for the public service, and of defending the empire at home or abroad against foreign enemies. He, or she (with reference to our present sovereign), also conducts all intercourse with the rulers of other nations, forming treaties and alliances, declaring war or concluding peace. She has the duty of protecting the persons and trade of British subjects in foreign countries. For this purpose, she has the sole appointment of the officers who perform these duties; of judges in the several courts of law; of officers in the army and navy; of public ambassadors, and of consuls at foreign ports for the safety of trade; and of the officers who levy the taxes. She has also large forces, both naval and military, at her disposal, which are stationed in different parts of the empire where she or her advisers think that they are wanted for the time. The task of managing all these extensive concerns, which would fall into confusion in the hands of one person, is deputed by the Queen to a number of persons, who are denominated her *Ministers*, and sometimes the *Cabinet*. These are nominally selected and appointed by the Queen herself; but as her choice would be in vain if it were to fall on men who were disagreeable to Parliament (which might in that case refuse to grant supplies for national business), the ministry is generally chosen from among such men as enjoy a considerable share of public confidence. They have all some high state office. The chief is the *First Lord of the Treasury*, whose nominal duty is the receiving and issuing of the public money, while his actual station is that of leader of the administration; he is the first who is appointed in any ministry, and generally selects all the other members, according to his own views of their abilities, or of the influence they possess in the country or in Parliament; and any changes afterwards made are generally at his suggestion, or at least with his full assent. Next is the *Lord High Chancellor*, who presides in the highest law-court of the kingdom, and is Speaker of the House of Lords;

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

he is chief adviser of the sovereign in all that relates to the laws of the country, and has the disposal of a great number of clerical and law offices. After him are the principal secretaries of state, who are five in number, each having a separate charge; the first is Secretary for the Home Department, after whom are the Secretaries for Foreign Affairs and for the Colonies, the Secretary at War, and the Secretary for Ireland. These, with the Chancellor of the Exchequer, the first Lord of the Admiralty, the Master-General of the Ordnance, the President of the Board of Control, and one or two others, constitute what is called the *Ministry*, the *Cabinet Council*, or briefly the *Cabinet*; and all the measures of the executive government are settled by their deliberations. Besides this body, the Queen has a *Privy Council*, consisting of persons eminent from rank, office, or personal character, who may be at variance with the Cabinet Council, but who take no share in the government, except when summoned by the royal authority. They are then in the same situation with the cabinet ministers, and become responsible for the advice they give.

The regular division of labour which is established in the British government, under the respective heads of the Cabinet, Treasury, Exchequer, Board of Trade, Mint, Revenue Boards, Admiralty, War Office, &c. is one of its chief excellencies; because every secretary, or other officer of state, having a particular department assigned to him, the responsibility for any error or mismanagement is established at once, and may be either rectified or punished. Parliament itself has its duties; and when these are not performed to the satisfaction of the electors, the members can be dismissed at next election, to make way for others.

The British constitution, thus slightly sketched, may be generally described as an anomaly in political science, being both professedly and in reality a mixture of all the three kinds of government—monarchical, aristocratical, and democratical. Such a government would probably be found totally inapplicable in other societies; but in Britain it answers well, having grown up in conformity with the views and character of the people, and enjoying, in consequence of that conformity, and of its long existence, the respect required to enable any system to work. Upon the whole, notwithstanding the Reform Acts, the aristocratic principle predominates, yet fully as much from the spirit of the people themselves, as from any forms of the constitution.

### DISPENSATION OF LAWS.

Justice, civil and criminal, is administered in England and Ireland according to laws and forms which took their rise in the former country, and were in time extended to the latter. The English law, as it is comprehensively termed, is of two kinds—written or statute law, consisting of the laws established by acts of Parliament, and consuetudinary law, consisting of customs which have existed from time immemorial, and have received the sanction of the judges. Consuetudinary law is again divided into common law and equity; the former is administered by courts which profess to adhere strictly to the old laws of England, except in as far as they are altered by statute; the latter was founded upon the principle that the king, in cases of hardship, was entitled to give relief from the strictness of the common law. Equity, though thus originated, has now become also a fixed kind of law, and is administered in courts which decide according to established rules.

The principal court for civil suits is the Court of Common Pleas. The Court of King's (or Queen's) Bench, which was at first only a criminal tribunal, and the Court of Exchequer, which was designed only to decide in cases concerning the revenue, have become civil courts by means of fictions in their respective modes of procedure. The Court of Chancery, presided over by the Lord Chancellor, administers the law of equity. Courts under these designations sit both in Westminster and in Dublin: there are also courts of *assize*, which, in England, perform six provincial cir-

cuits, in some instances once, and in others twice a year. Minor cases, criminal as well as civil, are judged by bodies of provincial magistracy, termed Justices of the Peace, who meet in every county once every quarter of a year. Besides the civil and criminal tribunals, there are ecclesiastical courts, which have jurisdiction in matters connected with marriage, wills, &c. and adopt the principles of the old canon law. There are also courts of Admiralty, which decide questions between persons of different nations, according to the code of civil law recognised throughout Europe.

Guernsey, Jersey, Alderney, and other small islands in the British Channel, which politically belong to the United Kingdom, possess a variety of peculiar privileges and legal usages. The Isle of Man, situated in the sea between England and Ireland, likewise possesses—absurdly enough—certain peculiar privileges.

In Scotland, laws peculiar to itself, founded upon the principles of the Roman and the Feudal law, are administered by a supreme civil tribunal, denominated the Court of Session, which remains fixed at Edinburgh, and by a criminal tribunal, named the Court of Justiciary, which not only sits in the same city, but makes circuits through the provinces. Minor civil and criminal cases are also judged in Scotland by the sheriffs of the various counties, and the magistrates of the boroughs. Scotland possesses the advantage of public prosecution of offences, the injured party being only a complainant to the public prosecutor. The chief public prosecutor is the Lord Advocate; the inferior public prosecutors, in connection with the various minor courts, are termed Procurators-Fiscal. The whole expense of prosecution is defrayed by the national exchequer.

The peculiar boast of the criminal law of the British Empire, is the *Jury*. In England and Ireland, where the principle of the criminal law requires the injured party or his representative to prosecute, he can only do so by permission of a jury of accusation, called the Grand Jury; another jury sits for the purpose of deciding if the evidence against the accused has established the guilt. These juries consist in England and Ireland of twelve men, whose verdict must be unanimous; in Scotland, the jury upon the charge consists of fifteen men, who decide by a plurality of votes. The jury is an institution of Scandinavian origin, transmitted to Britain through the Saxons; and it is justly considered as the most efficient protection of the subject from the vindictiveness of power. Civil cases, turning upon matters of fact, are likewise decided in all parts of the United Kingdom by juries.

The House of Lords, as the great council of the sovereign, acts as a court of last appeal from the civil tribunals of Britain and Ireland. Practically, the business of hearing these appeals is undertaken by some law lord, such as the Lord Chancellor, who, as there must be three persons present, is usually accompanied by a temporal peer and a bishop. Before deciding, the House sometimes demands the opinions of the English judges. Independently of their power as judges of appeal, the peers act as a criminal court in all cases where a peer of the realm is tried for a capital crime.

The laws and judicial usages of England are extended to most of the colonial possessions, along with all the rights and privileges which are common to British subjects. Hence the inhabitants of the most distant part of the empire, whatever be their origin, rank, or colour, are entitled by the constitution to enjoy the same degree of civil and religious liberty, and the same careful protection of life and property, as their fellow-subjects in the mother country. This is an invaluable boon, for in no nation do the people practically enjoy greater liberty of speech or action (without licentiousness), and in none is the press more unshackled. Next in point of value to the privilege of trial by jury, the British subject places the *right of petition* to the Houses of Parliament, either for an improvement in the laws or a redress of grievances. As this involves the right of assembling publicly in a peaceful manner, or of *meeting constitutionally*, to dis-

## CHAMBERS'S INFORMATION FOR THE PEOPLE.

cases measures of government and legislation, it is allowed to form the impregnable bulwark of British political freedom. [For further information on the legal usages of Great Britain and Ireland, the reader is referred to the HISTORY OF LAWS—forming No. 54 of the present volume.]

### RELIGION AND THE CHURCH.

The United Kingdom is a Protestant state, but all religions (not offensive to public or private morals) may be professed, and their different forms of worship practised, without interference from any quarter whatever. All denominations of Christians have their own churches, employ whom they please as their pastors, and are equally under the protection of the law. The empire contains several established or predominant churches, which are supported by special acts of the legislature. In England and Ireland, there is one church, denominated the *United Church of England and Ireland* (separate before the union of the two countries in 1800), being a Protestant Episcopacy. In Scotland, the established religion is Protestant Presbyterian. According to the constitution, the religion of the English Church, and also the law of England, are established in every colony by the simple act of adding the territory to the crown, unless there be a special provision to the contrary. Thus the Church of England prevails in all the great colonial dependencies, except Lower Canada, which is guaranteed a Roman Catholic hierarchy; the Cape of Good Hope, which has been guaranteed Protestant Presbyterianism; Malta, which is Roman Catholic; and so on with some minor colonial possessions and dependencies.

*Church of England.*—The affairs of the church are managed by archbishops and bishops; but no step of any importance, out of the ordinary routine, can be taken without an act of Parliament, and therefore the church may be said to be governed by the legislature of the country. The sovereign is the head of the church, which is thus in intimate union with the state. The laity, except through their representatives in the House of Commons, possess no right to interfere in any shape whatever with the doctrines or practice of the church. The doctrines defined by law are contained in the Thirty-nine Articles, and the form of worship is the Book of Common Prayer. (See No. 75). Ecclesiastically, the country is divided into *dioceses*, each of which is under the care of a bishop or archbishop; the dioceses are classed under two *provinces*, each of which is under the charge of an archbishop—namely, the Archbishop of Canterbury, who is styled 'Primate of all England and Metropolitan;' and the Archbishop of York, who is styled 'Primate of England.' The other dignitaries of the church are archdeacons, deans, and prebendaries; the inferior clergy are rectors, vicars, and curates. Strictly, there are only three grades, bishops, priests, and deacons, all clergymen belonging to one of these. The bishops are entitled to be addressed as 'my lord,' being legally spiritual peers.

The revenues exigible by law for the support of the church are most unequally distributed, and the dioceses are of very unequal proportions. The following are the names of the English sees, with the amount of their incomes:—

Canterbury, L.15,000; Bangor, L.4000; Bath and Wells, L.5000; Carlisle, L.3000; Chester, L.4200; Chichester, L.4200; Durham, L.2000; Ely, L.5500; Exeter, L.2700; Gloucester and Bristol, L.3700; Hereford, L.4200; Lichfield, L.4500; Lincoln, L.4000; Llandaff, L.1000; London, L.11,700; Manchester, L.4500; Norwich, L.4465; Oxford, L.5000; Peterborough, L.4500; Ripon, L.4500; Rochester, L.5000; Salisbury, L.5000; St Asaph, L.4200; St David's, L.2500; Winchester, L.10,500; York, L.10,000; Sodor and Man, L.2000.—Total income, L.147,865.

The greater part of these revenues are derived from lands, or rents for grounds let on leases, and for which fines are taken at entry. The chapters of cathedrals, composed of deans, canons, and prebends, possess also large revenues, the dean of Durham, for instance, having £4300 a year, and other members of the chapter

£32,160. In 1834, the gross revenues of the deans and chapters amounted to upwards of £235,000. The revenues of the inferior or parochial clergy are derived from tithes commuted into money payments, and also fees at celebrating marriages, baptisms, and funerals. With respect to the parochial branch of church emoluments, Mr McCulloch remarks—It appears that of 10,478 benefices, from which returns have been received, 297 are under £50 a year; 1629 are between £50 and £100 a year; and 1602 are between £100 and £150; so that there are 1926 benefices under £100 a year, and 3528, or more than a third of all the benefices in the country, under £150 a year. On many of these benefices there are no glebe houses, nor do they possess the means of erecting any. Curates are paid by the rectors or vicars, whose servants they are: by law their salary cannot be under £80—the average is £81. The total revenues of the church may be stated in general terms as follow:—

Archbishops and bishops, L.150,000; cathedral and collegiate churches, L.250,000; deans and other functionaries, L.60,000; 10,540 parochial benefices, L.3,100,000; curates of resident clergy, L.87,000; curates of non-resident clergy, L.337,000.—Total revenue, L.3,964,000.

The appointment of the clergy to benefices is as follow:—Presented by the crown, 952; by archbishops and bishops, 1248; by deans, chapters, and ecclesiastical corporations, 2638; by universities, colleges, and hospitals, 721; by private individuals, 5096; and by municipal corporations, 53. This, says the authority already quoted, is not exactly correct, there being upwards of 200 omitted in the returns.

In 1847, the total number of congregations belonging to the established church was 12,060. At the same time there were the following number of congregations of dissenters:—Roman Catholics, 441; Presbyterians, 230; Independents, 1860; Baptists, 1210; Calvinistic Methodists, 431; Wesleyan Methodists, 2890; other Methodists, 693; Quakers, 384; Home Missionary congregations, 459—total of dissenting congregations (exclusive of Jews), 21,085. It is considered probable that this number includes as many actual worshippers as the 12,060 congregations of the establishment. The members of the established church have been estimated at 4,500,000; and those of dissenting bodies at 4,000,000; but all such estimates are exceedingly illusory.

*Church of Ireland.*—In Ireland, the established religion is the Protestant Episcopacy, of which another branch is established in England. Thus the same doctrines, ritual, and forms of ecclesiastical government, exist in these two countries, the hierarchies only being different with respect to their political status. At present, there are two archbishoprics—namely, Armagh, and Dublin; the incumbent of the former being 'Primate of all Ireland,' and that of the latter, 'Primate of Ireland, and Bishop of Glendalough and Kildare.' The number of dioceses are thirty-two, now consolidated under eleven bishops. There have hitherto been 32 deans and 30 chapters of cathedrals. The number of parishes, including perpetual curacies, is (or was lately) 2405, but many have no church, and the number of incumbents for the whole is 1385.

The revenues of the archbishops and bishops in 1848, amounted to £79,917 annually; and the total income of the church, including value of glebe-lands and tithes, was £265,535. The tithes of most parishes are now compounded for.

The Roman Catholic Church in Ireland consists of four archbishoprics, and twenty-three bishoprics, with parochial divisions and a body of clergy similar to the plan of the establishment; to it also belongs a considerable number of monasteries. After the Roman Catholic body, the chief dissenting communion is that of the Presbyterians in the northern parts of the country. According to law, two days throughout the year, exclusive of Sundays, are set apart as holidays, or sacred from labour, in England and Ireland—namely, Christmas and Good Friday. Of the Irish population, the Established Church lays claim to 52,000; the Presby-

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

terians to 642,000; the Catholics to 5,800,000; and other dissenting bodies to 24,000.

*Church of Scotland.*—Protestant Presbyterianism, according to a polity introduced from Geneva by Knox, was established in Scotland by act of Parliament in 1560, a few years after the previous Roman Catholic Church had been completely dismembered and suppressed. The history of the country describes the struggles of this form of church government with Episcopacy during the greater part of the seventeenth century. Shortly after the revolution, an act of Parliament of William and Mary in 1690, re-established Presbytery on the model of a statute of 1592. According to the plan thus established, and never afterwards materially altered, the clergy of the Church of Scotland are all equal in rank, and are officially ministers of parishes. To the church belongs a body of lay functionaries called elders, each church having several, who assist the clergyman at the communion, visit the sick, and generally act as a vigilant ecclesiastical police. This incorporation of laity with the church has given it a remarkably secure footing in the affections of the people. The ecclesiastical community is governed by a series of courts—the lowest being the kirk-session in every parish, composed of the minister and elders; the next is a court composed of the clergy of a division, called a Presbytery, and an elder from each parish; the next is a synodal court, composed of functionaries from an aggregation of Presbyteries; and the highest is the General Assembly, composed of delegates from the Presbyteries, and which meets annually at Edinburgh. Constant residence in their parishes is obligatory on the clergy.

The parochial clergy are supported by money stipends levied from the heritors or landowners, on the principle of commuted tithes or teinds. The amount of stipends yearly depends on the average market value of corn, the averages being called *fiars*, which are struck annually by a jury in every county. Each minister being entitled to a certain quantity of grain, the value of the quantity, according to the *fiars*, is paid in money. If the teinds in the hands of the heritors be not all uplifted, the stipend is liable to be increased at the end of every twenty years. In 1848, the gross amount of teinds paid to the clergy annually was £148,000, and the amount left unappropriated in the hands of private individuals was £136,000. It is not stated by any authority we have consulted what unappropriated teinds are in the hands of the crown; but it appears that there are bishops' teinds (formerly revenues of bishops), amounting to £15,741 annually, of which a portion is drawn by the crown, and £10,182 unappropriated. The total income of the church, including value of globes and manse, is calculated at £274,620, being on an average of £256 each. In some parishes the exigible stipend is so small, that it is made up to a minimum of £150 by government. Among the largest stipends are those paid to the eighteen parish ministers of Edinburgh, who receive about £500 each, levied by a peculiar law as a money-tax from the inhabitants. The expense incurred for building and maintaining the fabrics of the churches and manse, is defrayed by the heritors along with the stipends.

In Scotland no secular days, such as Christmas and Good Friday, are legally set apart as holidays, the Scottish Church recognising no saints' days or holidays whatsoever. But in each parish there are one or two fast days in the year, held on the week preceding the celebration of the communion.

Scotland abounds in dissenters, the bulk of whom are only separatists from the church, and under various names, possess the same doctrines and formula. Besides these dissenters, there is a considerable body of Protestant Episcopalians, in communion with the Church of England; also Roman Catholics and Independents. The number of congregations belonging to the established church, and various dissenting bodies, may be summed up as follows:—Established Church, 1236; Free Church, 714; United Associate Synod, or

Secession Church, and other Presbyterians, 643; Independents, 141; Episcopalians, 110; other Protestant sects, 47; Roman Catholics, 77.

### EDUCATION.

*In England*, the chief institutions for education are—the ancient national universities of Oxford and Cambridge; the more recent colleges of London, Durham, and Lampeter in Wales; the classical schools of Eton, Westminster, Winchester, Harrow, Charterhouse, and Rugby; the military college of Sandhurst; and the East India Company's seminaries at Haileybury and Addiscombe; the colleges of the dissenting denominations; and the elementary schools of the National and British and Foreign Societies. Beyond the above-named schools, everything elementary is left entirely to private exertion or individual beneficence; and to this may be attributed the fact, that the number of scholars is as 1 to 11½ of the population, while in Prussia, for example, it is as 1 to 6. Some Schools of Design, recently established, the British and other museums, certain learned societies, and a number of mechanics' and other similar institutions, complete the educational machinery of the country. England is thus almost the only country in Europe in which there is no public or general system of elementary education—religious sectarian differences having as yet frustrated every scheme towards the establishment of so desirable an object.

Though government has not been able to organise any system of national education, 'it has,' says Mr M'Culloch, 'within the last few years adopted a plan by which it has done a good deal to promote instruction, without exciting the opposition that would have been called forth by its direct interference with existing systems. Parliament votes annually a sum for the promotion of education, the disposal of which is vested in the Committee of Council for Education. Hitherto (1847) the grants have been principally disposed of in advances towards the erecting of school-houses; but latterly, also, contributions have been made to the erection of houses for the masters, and for the purchase of books and other school machinery. The grants to schools are at the rate of £1 per head for every child in attendance, whether the school be for infants or for more advanced pupils. The principal condition annexed to a grant is, that the school so assisted shall be open to the visits and examinations of a government inspector.' The grants to the Committee of Council have been as follows:—From 1839 to 1842 at the rate of £30,000 per annum; from 1843 to 1844, £40,000; in 1845, £75,000; and in 1846, £100,000. To be fully effectual—that is, to meet the wants of the country, so that every one might enjoy at least the elements of an ordinary school tuition—the grant would require to be trebled or quadrupled; but even this is not desirable unless under a uniform and non-sectarian system.

In a country where there exists no national system, it is impossible of course to obtain anything like accurate statistics regarding the number of pupils, the sums expended, the curriculum or methods of tuition followed, or, in fact, anything that appertains to the elucidation of the all-important subject of education. Matters cannot, however, long continue in this state; and already we perceive in the existing parliamentary grants, in the discussions which have followed, in the establishment of school associations, and the like, symptoms of a better and brighter era.

*Ireland* possesses three collegiate establishments, in which the higher departments of science and literature are taught—namely, Trinity College, Dublin; the Roman Catholic College of Maynooth; and the Academical Institution in Belfast. Under a recent act of Parliament, four additional colleges are about to be erected, unrestricted by religious tests, and open to students of every denomination. Besides these there are several minor Catholic colleges, and the public classical or grammar-schools of the larger towns. Elementary education has in recent times made great

## CHAMBERS'S INFORMATION FOR THE PEOPLE.

advances in this part of the United Kingdom, so that the number of pupils receiving such instruction is now estimated at 1 to 10 of the population.

In 1831, there was established by act of Parliament a national system of education, the main feature of which is an arrangement by which the children are separated at certain times, and taught religion by their respective pastors—the necessary funds being provided by the state. By this means it was hoped that the great body of the people, and more particularly the children of the poorer class of Catholics, would at length be brought within the pale of education. We need not say how differently the plan has been regarded by various parties, both in Ireland and in Britain. The national board consists of nine commissioners chosen from both the Roman Catholic and Protestant bodies—the Roman Catholic and Protestant archbishops of Dublin being among the number. The commissioners in 1840 received £50,000 from the public purse; their estimate was £50,357, which they proposed to lay out as follows:—On training of teachers, £2220; model schools, £390; grants towards building and establishing new schools, £12,000; salaries and gratuities to teachers, £28,000; infant schools, £220; agricultural schools, £150; inspection, £4975; books and school requisites, £4250; and general expenditure, £3152. The fee paid by each scholar is 1d. per week. In March 1838, the number of national schools was 1384, attended by 169,548 children; but 195 new schools were soon to be opened, and it was expected that they would be attended by 40,106 pupils, making a total of 209,654. Reckoning, however, the schools said to be in actual operation in March 1838, there were then upwards of 169,000 children receiving a regular elementary education at an annual cost to the state of £50,000. Since that period the grant has been increased; and in 1845 there were 3426 schools, and 432,844 pupils, at a cost of £85,000.

Besides this great national system of elementary instruction, the country possesses several religious or charitable associations for promoting education among the poorer classes: of these the principal are the Kildare Place Society, which lately supported 1097 schools, attended by 81,178 scholars; the Church Education Society, which in 1845 had 1811 schools and 100,755 pupils; and the Sunday School Society, formed in 1809 for the religious instruction of children unable to attend schools on week days. The Roman Catholic body also supports a considerable number of schools.

Scotland possesses five colleges or universities for the higher branches of instruction, being those of Glasgow, St Andrews, King's College and Mareschal College Aberdeen, and Edinburgh. Education at these institutions is generally conferred on a more liberal and less expensive scale than at the universities of England. Besides these universities there are the recent and minor colleges connected with the Episcopal, Free Church, and Catholic bodies. Scotland has been long distinguished for its parochial institutions for elementary instruction, and also for its grammar-schools or academies in the chief towns, which serve as preparatory gymnasia for the universities. Each parish (some parishes in towns excepted) is provided with a school at the expense of certain landowners or heritors, in virtue of an act of Parliament passed in 1696, re-establishing statutes formerly in existence. Another act was passed (43 Geo. III. c. 54) in 1803, amending existing provisions on the subject, and ordaining 'that the salary of each parochial schoolmaster shall not be under £16, 13s. 4d., nor above £22, 4s. 5½d.,' except in particular cases mentioned; and provision is further made for augmenting this minimum and maximum at the end of every twenty-five years. An increase accordingly took place in 1826, raising the minimum to £25, 15s. 3½d., and the maximum to £34, 4s. 4½d. These payments are made according to the liberality of the heritors; and they besides must provide a small house for the schoolmaster, with a garden, as well as school-house. The teacher is entitled to take small fees in

addition; the more common fee is 2s. or 2s. 3d. per quarter for instruction in reading, with 6d. for writing. Altogether, this class of men are slenderly remunerated for their extremely valuable services. Within the last thirty years, the parish schools have been almost superseded in some quarters by the establishment of voluntarily supported institutions, such as those of the Dissenting and Free Churches, Subscription Academies, and the like; they have also been supplemented by various munificent endowments from private individuals, and recently by the proffer of aid from the Committee of Council on Education.

In a report to Parliament in 1834, the number of schools in Scotland was stated as follows:—Parochial schools, 1047; pupils attending them, 68,298; total emoluments of teachers, £53,339. Voluntarily supported schools, 3995; pupils attending them, 154,160. It appears from this that there were 222,453 children receiving instruction (not including the attendance at Sunday schools), and that of these only 68,298, or little more than one-fourth, were educated at the parochial schools. There were 5042 schools, and of these only 1047, or about one-fifth, were parochial establishments. The publication of this report caused considerable surprise, for it was generally believed that the great bulk of the juvenile population were instructed in the parish schools. The total emoluments of the parish teachers are stated at £53,339, or on an average, nearly £51 each; but of this sum only £29,642 is stated as salary, there being collected in school fees, £20,717, and from other sources, £4975. The average annual expense of educating each child at the parochial schools, on the above data, appears to be 15s. 7½d. A great difference was found between the attendance of males and females. Taking the entire attendance on schools, there were 132,489 males, and 89,964 females. The result of the inquiry seems to be, that about 1 in 9 of the population in Scotland attends school.

The generally imperfect instruction among the humbler orders of society in all parts of the United Kingdom, is strikingly manifested in the returns of criminal commitments. On this interesting topic we extract the following results of an inquiry instituted with respect to education and crime, and lately embodied in a pamphlet read before the Statistical Society of London, by Rawson W. Rawson, Esq.:

1st, That only 10 in 100 of the criminal offenders committed for trial in England and Wales are able to read and write well, and of these only 4 in 1000 have received such an amount of instruction as may be entitled to the name of education; and that these proportions are greatly below the average standard of instruction among the general population.

2d, That these proportions are considerably higher in Scotland, and lower in Ireland; and the evidence appears to establish that the degree of instruction possessed by criminal offenders is an indication of that possessed by the general population in the same districts.

3d, That about one-third of the adult male population of England cannot sign their own names, and that from one-fifth to one-fourth can neither read nor write.

4th, That these proportions are much more favourable than in France or Belgium, where one-half of the youths at eighteen could neither read nor write. The proportion of wholly ignorant criminals in those countries is correspondingly greater than in England.

5th, That in England, instruction is twice as prevalent among male as among female criminals, and one-half more prevalent among males in the general population than among females. That in Scotland and Ireland school instruction is three times as prevalent among the male criminals.

6th, That this unfavourable condition of females in these two countries is further confirmed by the fact, that the proportion of female to male criminals is greater than in England; and it may be traced to the circumstance of the number of girls at school in those two countries being very small in comparison with the number at school in England. In comparing the three

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

countries, the number of female criminals is found to be exactly in the inverse ratio to the proportion of females attending school.

7th, That education has a greater influence among females than among males in restraining them from the commission of crime.

8th, That instruction prevails, upon an average, to a greater extent among the agricultural than among the manufacturing counties of England; but that the agricultural counties in the east, east-midland, and south-east, are greatly below the average.

Since the above results were deduced, a new and gratifying feature of the age has appeared in the establishment, in many of our more populous towns, of what are termed Industrial Schools. These humble institutions are intended solely for those neglected and destitute children who would otherwise be uncared for, and allowed to grow up in ignorance, beggary, and crime. Already much good has been done by these schools, in which the children receive certain meals, clothing, elementary instruction, and are trained to industrial habits. As yet they have depended on private subscription; but a more legitimate object for government support could not well be imagined.

### FINANCES.

*Revenue.*—The revenue of the British Empire has varied exceedingly of late years; from 1761 to 1774, which was a period of peace, it increased from £8,800,000 to £10,285,673; and since that time, from the various wars in which the country was engaged, the immediate expenses, and the interest of public debts, it has continued to augment till within these last ten or twelve years. From 1775 to 1783, which was the period of the American war, it rose from £10,000,000 to £12,000,000; and during the peace which followed till 1793, it was increased to £17,500,000 a year.

After this period the French revolutionary war commenced. That war was by no means unpopular with the nation; and it was besides gilded by the many splendid victories which continued to be obtained by British seamen as long as the enemy had a fleet to appear at sea. Heavy taxes for defraying the expenses of this war were therefore submitted to without remonstrance, and the public revenue rose accordingly to a very large amount. From 1794 to the peace of Amiens in 1801, which only lasted two years, the revenue was increased from £17,500,000 to £28,000,000; and from 1803 till 1816, the year after the final conclusion of peace, it had risen to £76,834,494, which was the largest sum raised by taxes in one year.

The sums thus raised in taxes, large as they were, did not, however, meet the expenditure of the country during these periods of war. In order to defray the great charges which arose, it became necessary also to borrow to a great amount. The following table will show the sums raised by the taxes, the sums borrowed, and the total expenditure for each of the years specified:—

Year.	Raised in Taxes.	Borrowed.	Total Expend.
1794	£17,674,305	£5,079,971	£22,754,306
1801	28,065,529	33,539,189	61,617,968
1803	36,401,738	23,973,742	62,373,480
1806	53,698,194	23,308,673	76,056,796
1810	66,029,349	25,763,308	88,798,551
1814	70,696,215	58,309,445	129,235,650
1816	76,834,494	84,471,464	130,306,968

These sums will appear altogether enormous, and must give the most extraordinary idea of the resources of a government, which, while it raised such a large yearly amount in taxes, had yet credit to borrow the immense additional sums which were wanted. The whole sum which was expended in the wars of the Revolution, from 1794 to 1816, amounted to £1,700,000,000 sterling—a sum so far beyond all ordinary dealings, that we can have little conception of its amount or value.

The debt formed by borrowing money at different rates of interest to conduct the warlike operations of the country, has risen from small beginnings towards

the conclusion of the seventeenth century, to an unparalleled amount. At the revolution of 1688, the national debt amounted to only £664,263; at the accession of Queen Anne, £16,394,702; of George I., £54,145,363; of George II., £52,092,255; at the end of the Spanish war in 1748, £78,293,312; at the commencement of war in 1755, £74,571,840; at conclusion of peace in 1762, £146,682,844; at commencement of American war in 1776, £135,943,051; at conclusion of peace in 1783, £238,484,870; at commencement of French revolutionary war, £253,733,609; at peace of Amiens in 1801, £582,839,277; at peace of (Feb. 1) 1816, £864,822,461; on the 5th of January 1843 it was £772,401,851, with an interest of £27,753,663. At the same period the amount of outstanding Exchequer bills was £17,974,500, which raised the sum-total of the national debt to seven hundred and ninety millions, and the total interest to £28,141,531! The annual cost of management of the national debt is £91,398.

The revenue which it is necessary to raise for the purpose of paying the interest of the debt, and conducting the business of the country, is derived from taxation upon a great variety of different articles, which are all, however, reduced to the following heads:—

1. *The Customs.*—These are taxes levied upon the foreign commerce of the country, being the duties paid upon articles imported from abroad, such as tea, sugar, coffee, spirits, wines, tobacco, &c. They include also a few on some goods exported, such as coals, wool, and skins. Their whole amount in the year ending January 5, 1848, was £20,024,431.

2. *The Excise.*—The Excise taxes are those which are levied on goods of British manufacture, such as glass, malt, paper, &c. The duty is paid back again to the maker if the commodity is to be exported to foreign countries. This class of taxes yielded, in the above year, £12,883,677.

3. *Stamp Duties.*—These consist of the prices affixed to stamped papers, upon which the law makes it imperative that every document for the transfer of property, or other obligation, shall be written. Deeds, settlements, and bills, bills of exchange, receipts (above a certain small amount), and a great variety of other instruments of business, are required to be stamped in this manner: and the prices affixed to the stamps, which are often high, bring a large revenue. Under the head of stamps are also included newspaper stamps, indentures, dice, duties on plate, and other anomalous items. The whole amounted in the above year to £7,527,543.

4. *Assessed Taxes.*—These are duties levied on land, on windows (eight or upwards), male servants, riding-horses, dogs, use of armorial bearings, hair powder, &c. This class of taxes, which are levied by surveyors and collectors, amounted in the above year to £4,334,561. The principal items are the land and window taxes, each of which was above £1,000,000.

5. *Income and Property Tax.*—A tax on property and incomes beyond a certain annual amount has been occasionally resorted to in time of war, or during extraordinary financial depressions. A burden of this kind was imposed in 1841; then as a temporary expedient, but the state of the country has since rendered its continuance necessary. It is at the rate of 7d. per pound on property, and on all incomes exceeding £150 per annum, allowance being made for certain kinds of loss and outlay. The revenue drawn from this source in 1848 amounted to £5,450,800. In 1847 it was £5,593,109; and in 1846, £5,603,443.

6. *Post-Office.*—In the year ending October 1839, the revenue derived from the tax on letters passing through the post-office was £2,390,764. But by the reduction of postage to one penny per letter (if under half an ounce) at the beginning of 1840, the amount of revenue derived from this source in the year ending January 1840, was only £441,000; and in 1848, £923,000. The great advantage derived by the country from cheap postage more than compensates the deficiency.

7. The income derived from rentals of crown property, and the sale of timber, bark, &c. from the crown lands

(with other incidents), yielded a revenue in the above year of £77,000.

8. *Miscellaneous*.—These include duties on hackney-coaches, hawkers' licenses, offices, pensions, fees, and goods seized for taxes, together with a number of other casual receipts. Their amount in 1848 was £119,788.

9. The above sources are those from which the ordinary revenue is received; but in addition to these there are imprest and other moneys, money received from the East India Company, unclaimed dividends, &c.—all of which in 1848 amounted to £205,462.

The total of the income for the year ending 5th January 1848 was thus £51,546,264; and it will be observed that of that sum fully £32,000,000 were raised from customs and excise, or duties on foreign and British manufactures, and above £7,000,000 on stamps. Thus the great bulk of taxation is indirect, and the really direct taxes are small in comparison. The chief burden of the taxes evidently falls on the consumers of tea, coffee, sugar, tobacco, soap, spirits, and wines, and these consumers are the great body of the people. Considerable reductions have been recently effected, however; and the evident tendency of the times is to direct rather than to indirect taxation. Since 1831, not only have numerous duties been reduced and modified, but those of an unproductive nature have been swept from the tariff; while those on corn have been rendered merely nominal.

*Expenditure*.—The gross annual revenue of the kingdom in 1848 was £57,795,249, which, after deduction of outstanding balance, charge of collection, &c. left a nett income, as above-mentioned, of between £51,000,000 and £52,000,000: let us now see how this large sum is expended. The first great item of expenditure is in the form of interest on the national debt, amounting to £28,141,531; the navy, £8,013,873; the army, £7,540,405; the ordnance, £2,947,869; miscellaneous services charged on annual grants of Parliament, such as objects of science, museums, education, surveys, Parliamentary commissions, public buildings, printing and stationery, &c. &c. £3,561,067; courts of justice, £1,046,594; annuities and pensions charged on the consolidated fund, £529,804; other salaries and allowances, £432,157; miscellaneous charges, £310,976; on account of Irish distress, £1,525,000; civil list, £393,983. With respect to this last sum, which is the expense incurred for the personal support of the sovereign and royal family and household, we may remark that it forms but a small item in the general expenditure of the nation. Formerly, the crown possessed private revenues from lands, duties, &c. but all such are now abandoned to the country (chiefly under management of the Board of Woods and Forests), and the sovereign, in requital, is voted a civil list, or certain fixed sums, by vote of Parliament.

The total expenditure thus amounts to £59,230,413—making an excess of expenditure over the income of £2,956,683. To meet this excess, either new taxes must be imposed, and new loans contracted, or a corresponding reduction must be made in the national outlay; and it is now to the latter alternative that the attention of the public is being directed. That the expenditure of nations, as well as that of individuals, should never exceed their incomes, is just and prudent; where an opposite course is pursued, it is sure to lead to embarrassment and dishonour in the long-run.

THE ARMY AND NAVY.

*The Army*.—According to the terms of the constitution, a permanent or standing army is not held to be legal. It is understood that the civil power, as exerted by magistrates, constables, and police, is competent to preserve order, and that the creation of a military force is only a matter of temporary necessity. An army, however, being constantly required both to assist the civil authority, and to protect the foreign possessions of the empire, an act of Parliament, called the Mutiny Act, is passed annually, to maintain a large body of troops in regular service. Whether from this

provision in the constitution or otherwise, it happens that education in military tactics is conducted on a very limited scale: the privates in the army are enlisted by small bounties from the lowest classes of the community, and very rarely, if ever, are promoted to the rank of commissioned officers. The commissioned officers, in general, belong to the aristocracy or landed gentry, and in most instances purchase their commission according to a scale of prices. Although both privates and officers are alike ill-prepared, by previous instruction, for performing the duties of their profession, such are the effects of discipline, the excellence of equipment, and other advantages, but, above all, a high tone of honour and spirit of valour, that the British army is found able to compete with forces recruited under far more favourable circumstances. It is composed of infantry and cavalry, variously accoutred according to the part they have to perform in the field.

In 1848, the army (infantry and cavalry) consisted of 122,812 rank and file, 9962 non-commissioned officers, and 6995 officers. Number of horses, 11,000. The annual estimate for this branch of our forces is at present £6,318,686. To this account there is to be added what is called the civil department of the army, or the army management, consisting of the salary of the secretary-at-war and his office, the commander-in-chief and his office, the medical departments, &c. By an act passed in the reign of George IV., a sum of £60,000 is paid into the Exchequer by the East India Company, on account of the charge for retiring pay and pensions, and other expenses of that nature, arising in respect of the forces serving in India. This sum is applied towards the general expenses of the state. The pay of a private in the Horse Guards varies from 1s. 9½d. to 2s. 0½d. per day; in the cavalry of the line, 1s. 4d.; in the Foot Guards, 1s. 2d.; and in the infantry of the line, 1s. 1d. When at home and in barracks, 6d. a day is deducted from this, for which the soldier receives three-quarters of a pound of meat and one pound of bread. The principal part of his clothes and accoutrements is furnished at the public expense; his pay, however, is subject to a deduction of 2s. 7½d. a week, in the case of privates serving in the cavalry; 1s. 1d. a week from privates in the Foot Guards; and 1s. 6d. from all other privates, on account of these articles.

Besides the cavalry and foot regiments, there is another description of force called the Ordnance, which includes artillery, engineers, miners, &c. They have the management of fortifications, with their guns, stores, &c. the making of rockets, and different kinds of shot for great guns. The numerical force of this branch of the service amounts to 14,294 men and officers. These, with equipments, cost upwards of £3,000,000 annually. Of the British army, 113,847 are employed at home and in the colonies, and 24,922 in the East Indies. The troops at home are chiefly lodged in barracks, as a police, near the large towns.

The statements which we have made above relate entirely to the effective force of the army, which is either on active duty or ready to be so employed. But there are a great number of persons attached to the army who do no duty, though receiving pay like others. Some of these are pensioners, who have either been long in service, or have suffered by wounds, &c.

*The Navy*.—Great Britain has long been renowned as a first-rate naval power: by command of its war vessels it protects its commerce, and exerts its authority in the most remote quarters of the globe. It is usual to say that Britain possesses the 'dominion of the seas;' but this is only a figure of speech. The nation possesses no acquired or vested sovereignty over the ocean, acknowledged by other powers, although at times it may forcibly compel submission. The British royal navy is recruited in much the same manner as the army; but the constitution, by a singular anomaly, sanctions the forcible abduction of men from their private homes to serve on board of war vessels. This species of impressment, however, is only resorted to in cases of urgent necessity; as, for instance, during the

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

heat of war. The sailors who enlist are generally young men who have served an apprenticeship on board merchant vessels; and with this preparation, they form seamen of the highest qualifications; their courage, integrity, and kind-heartedness, are a lasting theme of national gratulation. At present the total force of the navy amounts to 43,000 men; of whom seamen 27,500, boys 2000, marines afloat 5500, marines ashore 8000. To these are to be added about 900 employed officers. The average pay of a sailor is £1, 14s. per month, with victuals, which are estimated at about £1, 4s. additional. Much complaint is made of the high salaries paid to people about the dockyards; the master-workmen receiving £250 per annum, and the artificers from 5s. to 12s. 6d. per day. During the war with France, Great Britain had upwards of 1000 ships, manned by 184,000 seamen.

In November 1848, the royal navy consisted of 673 vessels, of which the following were in commission:—19 first-rates, of from 120 to 100 guns each, mounting 2216 guns; 76 second and third-rates, of from 104 to 70 guns each, mounting 6196 guns; 126 fourth, fifth, and sixth-rates, of from 65 to 18 guns each, mounting 1873 guns; 79 sloops, of from 18 to 8 guns each, mounting 986 guns; 16 brigs, of from 8 to 3 guns each, mounting 78 guns. Steamers—22 ships and frigates, with an aggregate power of 12,222 horses, and mounting 281 guns; 42 sloops, of an aggregate power of 13,300 horses, and mounting 251 guns; 56 gun-vessels, of an aggregate power of 6748 horses, and mounting 125 guns; 2 screw-schooners, whose joint power is 120 horses, and mounting 20 guns; steam-guardships, classed as fourth-rates, 3800 horse-power. Grand total, 420 vessels, mounting 15,026 guns. Of this force 104 are steam-vessels, propelled by engines of an aggregate power of 36,180 horses. This return does not include the mail flotilla of Dover, Holyhead, Liverpool, other stations, &c. Ships in ordinary are vessels which are dismantled, and put aside in a harbour, with only a few persons on board to take care of them. A ship in service, or even thus taken care of, will waste and rot, it is said, in fourteen or sixteen years; but a plan has lately been devised by which those not in service may be hauled up out of the water, and placed under cover, which it is expected will make them last much longer.

The cost of vessels of war in building is from about £40,000 to £110,000, according to dimensions. An 80-gun ship costs for hull £54,900, for rigging and stores £16,005—total, £70,905. A ship of this size, with a complement of 750 men, costs per annum, for pay of officers and wages of seamen, £19,812; for provisions, £13,325; for rigging and stores, £8201; for wear and tear of hull, £3660—total, £39,998. This is exclusive of charge for ordnance and marines. The naval estimates for the year 1849 were £7,951,842. Dividing this sum by 252, the number of ships and vessels in commission, it appears that the average cost per annum of each vessel is £31,554. These particulars are mentioned, in order that the people may have a proper notion of the expenses at which naval armaments are maintained.

There are six marine arsenals or dockyards—Deptford, Woolwich, Chatham, Sheerness, Portsmouth, and Plymouth. The principal foreign stations for the navy are Gibraltar and Malta in the Mediterranean; Halifax and Quebec in North America; Jamaica and Antigua in the West Indies; and Trincomalee and Bombay in the East Indies.

### AGRICULTURE—MANUFACTURES—COMMERCE.

In consequence of the industry exerted in Britain for several centuries, the greater part of the soil is now in a high state of cultivation and fertility; roads, railways, and canals, for carriage and communication, are everywhere formed; substantial farmsteads, villages, and large and populous towns, stud the surface; harbours, docks, factories, foundries, and other useful erections, unequalled in number and extent, form a chief feature of the country; and manufactured pro-

ducts of every description are produced in astonishing quantities—thus conferring not only upon the inhabitants, but upon the people of other countries, an amount of comforts and luxuries hitherto unknown.

Out of a total of 77,000,000 of acres in the British islands, 47,000,000 are cultivated, 15,000,000 uncultivated, and 16,000,000 incapable of cultivation, according to our present notions of agriculture. The value of the cultivated soil has been estimated at about £1,700,000,000; of mines, at £120,000,000; of roads, canals, and other means of communication, at £130,000,000; of dwellings, factories, and kindred erections, at £540,000,000; of annual agricultural produce and implements, at £224,000,000; of horses, cattle, sheep, and other live-stock, at £242,000,000; of manufactured goods, at £190,000,000; of mercantile shipping, at £85,000,000; of foreign merchandise paid for, at £53,000,000; and of fisheries, foreign and domestic, at £5,000,000; being a total of *productive property amounting to more than £3,000,000,000!* Besides this enormous sum, it is supposed that the nation possesses, of unproductive property, including waste lands, household furniture, apparel, ornamental articles, coin, &c. £580,000,000; and of public property, as churches, hospitals, prisons, arsenals, forts, military stores, dockyards, ships of war, &c. £105,000,000; being a grand total of £4,124,000,000!

The large amount of useful and agreeable things represented by this sum, and which afford subsistence and comfort to more than 27,000,000 of people, are, let it be carefully observed, the *results of labour*; in other words, the difference between the country in its primitive state, and the condition which it has attained after nearly 2000 years of well-directed ingenuity and toil. Against this sum, however, must be placed the National Debt, amounting to more than £790,000,000. This debt is no doubt owing to individuals within the nation, and who spend the interest arising from it in the country; but it does not the less on that account represent a portion of the results of industry bestowed in such a manner as to produce no return.

The people engaged in *agriculture* and other rural employments are necessarily spread over the whole of the cultivated parts of the country. Of these, the farmers or lessors of the ground are in general much superior in wealth and style of living to the farmers of any other country in the world; being generally, to a certain extent, capitalists, who employ labourers to perform the actual business of rural economy. The annual value of the produce raised in England—namely, crops, gardens, grass, and woodlands—is estimated at £141,000,000; in Scotland, at £28,000,000; and in Ireland, at £217,000,000.

In manufactures and commerce, Britain has long enjoyed a superiority over all other countries. For this the nation has been indebted not only to their naturally industrious dispositions, and the enlightened men who have in the course of time invented machinery for increasing and cheapening the products of labour, but, as already stated, to the extraordinary abundance of mineral substances requisite for manufactures, and to the insular nature of the country, which admits of ready maritime communication with other regions. In consequence of these advantages combined, Britain has for a long time furnished articles of clothing and household conveniency to many parts of the world, receiving in exchange either money or raw produce which its own soil and climate do not permit of being grown.

The *cotton* manufacture, notwithstanding that the raw material can be obtained only in distant parts of the earth (America, the East Indies, and Egypt), has risen in Great Britain, during seventy years, from about £200,000 of annual produce, to the enormous sum of £56,000,000, of which about two-thirds is exported. Cotton goods are manufactured chiefly by means of machinery, in large factories, of which, in 1839, there were 1603 in England and Wales, 192 in Scotland, and 24 in Ireland; the chief seats of the manufacture being Manchester, Glasgow, and Paisley.

CHAMBERS'S INFORMATION FOR THE PEOPLE.

These factories gave employment in the same year to 259,000 persons, of whom upwards of 12,000 were below thirteen years of age. Cotton goods are also manufactured by handloom weavers, of whom a considerable number continue to strive against the overpowering competition of machinery.

The *woollen* manufacture, which is the oldest in Britain, was carried on in 1839 by 86,411 persons, in 1738 factories, of which 1595 were in England and Wales, 112 in Scotland, and 31 in Ireland—jointly realising an annual value of about £25,000,000. This amount includes of course all sorts of woollen and worsted stuffs—as broadcloths, tweeds, blanketings, flannels, carpets, hosiery—in fine, all articles into which wool enters as the principal ingredient. Of such goods not less than £8,250,000 sterling are now annually exported from Britain. The woollen manufacture, particularly the finer kinds, is chiefly carried on in the west and north of England; both fine and coarse fabrics are now made at Galashiels in Scotland; and Kilmarnock and Stirling drive a thriving trade in carpets, bonnets, &c. In the finest kind of broadcloths, the Prussians are said still to excel the English.

The *linen* manufacture has also been long prosecuted, especially in England and Scotland; but until of late years its progress has been inconsiderable, compared with that of our other manufactures. No very accurate statistics of the trade can be obtained, in consequence of hand-power being employed to a large extent both in the spinning and weaving of the material. In 1839 there were 169 flax factories in operation in England, 183 in Scotland, and 41 in Ireland—employing respectively 16,000, 18,000, and 9000 hands. According to Mr McCulloch, the entire value of the linen manufacture of the United Kingdom in 1847 did not exceed £10,000,000.

The *silk* manufacture, introduced by French immigrants in the sixteenth century, is carried on to a great extent at Spitalfields, Coventry, Manchester, Paisley, and Glasgow. Silk enters into so many articles, either whole or as a component part, and is so widely spread over the kingdom, that any estimate formed of the value of the manufacture must be regarded merely as an approximation. Standard authorities estimate the annual value at upwards of £10,000,000—about one-tenth of which is exported. There were, in 1846, 150 mills, employing about 35,000 persons of all ages.

The *hardware* manufacture is one in which the metallic and mineral wealth of the country, combined with the skill of British workmen, have long given us a pre-eminence over other nations. Iron to the amount of more than 1,000,000 tons was, in 1842, prepared from British mines, for the purpose of being manufactured into machinery, rails, steam-ships, domestic utensils, firearms, cutlery, and other articles of convenience. The manufacture of the finer class of hardware is chiefly seated at Birmingham and Sheffield; machinery, ship-building and the like, at Birmingham, Manchester, Liverpool, Glasgow, and Dundee; while the principal foundries for the preparation of the crude material are in Stirlingshire, Lanarkshire, Wales, and Staffordshire. The annual value of hardware now manufactured in Britain is estimated at £18,000,000, giving employment to 300,000 hands. This is exclusive of watches, plate, articles of jewellery, &c. which are valued by Mr Jacobs at somewhere about £3,000,000.

The miscellaneous manufactures of the country are so numerous and complicated, that it is impossible to form anything like a correct estimate of their respective values. *Leather* goods, for example, have been set down at an annual value of £16,000,000; *earthenware* and *china* at £2,500,000; *paper* at £2,000,000; and similar valuations have been put upon glass, soap, malt liquors, &c.; but all such estimates must be regarded as mere approximations. 'It is to be regretted,' says Mr McCulloch, 'that there are no means of forming any estimate of the real value of the manufactured articles annually produced in Great Britain and Ireland. But the previous statements show that it must

be very great. There are, in fact, but few departments in which we are able to obtain a tolerably close approximation to the gross value of the articles produced; and even though we could do this in them all, the results would not be of so much value as is commonly supposed, and might indeed, unless subjected to further examination and analysis, lead to the most erroneous conclusions. It is supposed by many, that whatever may be the annual value of our manufactured goods, we shall, by adding it to the annual value of our agricultural products, get the total value of the new commodities annually produced in the empire. But this is an error. The value of the British wool, for example, employed in the woollen manufacture, may amount to from £5,000,000 to £5,500,000 a year, and forms an item of this amount in estimating the value of the manufacture. It is plain, however, that if we include this wool in any estimate of the agricultural produce of the country, we must exclude it from that of its manufactured produce; for if we do not, it will be reckoned twice over. The same thing happens in a vast variety of cases. Hence the extreme difficulty of forming any fair estimate of the real value of many species of manufactures.'

The *commerce* of Britain is conducted by vessels belonging to private parties within the realm, or in other countries. In 1845, the mercantile navy of the home country and its colonies consisted of nearly 32,000 vessels, of more than 3,500,000 of aggregate tonnage. We obtain, however, a more distinct idea of the extent of the national commerce from a calculation of the number of vessels, British and foreign, which in 1845 entered and departed from British harbours. These were—of British, 21,000; of foreign, 11,600, comprehending an aggregate of above 6,000,000 of tonnage. The chief mercantile port of Britain is London, after which Liverpool, Dublin, Bristol, Leith, Hull, Glasgow, Newcastle, Greenock, and Belfast, rank in succession. Duties exceeding £11,000,000 are annually paid to government for goods imported into London; and harbour dues to the amount of £150,000 were collected in 1830 for vessels in the docks at Liverpool.

The following table exhibits the Quantities of the Principal Articles of Foreign and Colonial Merchandise entered for Consumption in the years ending January 5, 1847 and 1848:—

	1847.	1848.

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

Besides tea, wine, and sugar, the imports of Britain consist chiefly of raw materials for manufactures, while the exports are almost exclusively manufactured goods. The greatest quantity of imports is from America; the greatest quantity of exports to the same part of the world. Tea, to the weight of 44,000,000 lbs., is obtained from China; wine, to the amount of 6,000,000 gallons (in 1848), chiefly from Portugal and Spain; sugar, to the value of £7,000,000 sterling, is exclusively imported from the West Indies; cotton, in its raw state, is obtained chiefly from the United States. Of wool, the coarser sort is obtained at home, while the finer kinds are imported from Germany and Australia. Tallow, hemp, and timber, to the value of £4,000,000, are annually imported from Russia.

The annual exports of native produce of the United Kingdom are valued at about £60,000,000, and the re-exports (of goods previously imported) at £16,000,000—total £76,000,000. The annual imports are valued at about £75,000,000, thus leaving a balance of £1,000,000 in favour of the United Kingdom to be paid in money. This balance, however, is subject to many causes of fluctuation. Of the £60,000,000 of exports, upwards of £14,000,000 are sent to Northern Europe; £11,000,000 to Southern Europe; £1,600,000 to Africa; £11,200,000 to Asia; £7,000,000 to the United States; £5,500,000 to our North American Colonies and the West Indies; £1,200,000 to foreign West Indies; and £5,400,000 to Southern and Central America. Our best customers are the United States, taking £7,000,000; the East Indies, £7,000,000; Germany, £6,000,000; Holland, £4,000,000; British North America, £3,000,000; and the West Indies, £2,500,000. The countries ranking next in order, and receiving between £2,000,000 and £3,000,000 of our exports, are France, Italy, Turkey, China, West Indies, Brazil, and Russia. Of the produce so exported, cotton goods yield the largest value; after which woollen goods, iron and steel, hardware, linen, brass and copper manufactures, arms and ammunition, rank in succession.

The following table exhibits the Declared Value of Principal Articles of British and Irish Produce and Manufactures, Exported in the Years ending January 5, 1847 and 1848:—

	1847.	1848.
Alkali, - - - - -	£152,412	£311,830

<b>Totals, - -</b>	<b>142,525</b>	<b>12,219,796</b>	<b>158,922</b>	<b>13,265,625</b>

The currency or money of the United Kingdom is about £26,000,000 of gold and silver coin, and £32,000,000 of bank-notes, chiefly of the value of five and ten pounds—total, £58,000,000. As nearly all large payments, however, are made by bills of exchange and drafts on bankers, there is an enormously large currency of that kind. It has been calculated that the amount of bills, promissory-notes, and bankers' drafts in circulation at any one time cannot be much less than £122,000,000. The centre of all the great money transactions of the British Empire is London, in which is situated the Bank of England, or principal banking institution. The amount of foreign and inland bills of exchange and drafts payable in London daily, is estimated at £4,000,000. In Scotland, which is celebrated for its well-conducted banking institutions, the money currency is chiefly one-pound bank-notes and silver.

On the 7th of October 1848, the note circulation of the United Kingdom was as follows:—Bank of England, £17,505,718; private banks, £3,681,544; joint-stock banks, £2,666,749; Scotland, £3,136,516; Ireland, £4,506,421. The money coined in 1847 consisted of 110,400 lbs. gold, yielding £5,158,440; of 38,100 lbs. silver, yielding £125,730; and of 40 tons copper, yielding £4960.

In all parts of the United Kingdom there are now National Securities Savings' Banks, for the safe custody of small sums, the savings of labour, and for which the national credit is pledged. The amount of deposits, chiefly the property of the humbler orders of the community, is now upwards of £32,000,000, and is annually increasing. In 1845, the number of individual depositors was considerably above 1,000,000.

### PUBLIC WORKS, CANALS, RAILROADS, DOCKS, &c.

Connected with our manufactures, are the great works of the civil-engineer—canals, roads, docks, bridges, piers, &c.—works which attest, more obviously than any others, the activity, power, and resources of the country. It is to the facility of internal communication afforded by these works, that the heaviest goods, though manufactured in the interior of the country, can be carried to seaports for exportation, without any burdensome addition to their price; and that materials for their different manufactures can be carried to inland towns from seaports, by canals or railroads, with the same advantage; while intelligence can be conveyed between the principal towns and seaports in the course of a few minutes, without that loss of time and opportunity which is so valuable in a highly-competitive country.

The length of the *turnpike roads* of England and Wales would, if joined together, form a continuous line of above 26,000 miles in length. The expenditure of the trustees on account of these roads, in 1841, amounted to £1,551,336; the revenue for the same year being £1,574,518: of the total expenditure, £302,182 went to defray the interest of debt, which, in 1829, amounted to £5,578,815! The length of the various *cross roads* and other highways in England and Wales is estimated at about 104,000 miles. In Scotland the aggregate length of the *turnpike roads* is estimated at 3700 miles; and the *cross roads* in tolerable repair at about 10,000 miles. Of the roads in Ireland there are no accurate statistics; but great improvements have recently been effected under the superintendence of the Board of Public Works. Since

the introduction of railways, statistics in reference to the traffic and passengers on the turnpike roads are comparatively valueless unless for mere local purposes. The traffic and revenue of the chief lines are rapidly falling away, and this circumstance loudly calls for some other mode of maintenance than the expensive and obstructive exaction of toll dues.

The navigable *canals* used for the transport of goods and produce in England alone are estimated at 2200 miles in length, while the navigable rivers exceed 1800 miles—making together more than 4000 miles of inland navigation, the greater part of which has been erected or rendered available within the last eighty years. Scotland possesses about 200 miles of navigable canal; and though the physical character of the country is unfavourable to this species of inland communication, the want is less felt in consequence of the numerous firths and arms of the sea which intersect this portion of the island. The whole extent of navigable canals available in Ireland does not exceed 300 miles, and including river navigation, the entire water communication falls short of 500 miles. 'What the condition of that fertile country might become,' remarks Mr Porter, 'if its means of communication were placed upon an equal footing with those of the midland and southern counties of England, is a question of the highest interest to every one who has at heart the moral and intellectual advancement of the Irish people, and, as a consequence, the general prosperity of the United Kingdom.' In 1829 the revenue arising from the canals of England and Scotland exceeded £13,000,000, which, besides keeping them in repair, afforded an average profit to the proprietors of 5½ per cent. on their original capital; but in consequence of the greater facilities afforded by railways, a great decline has taken place in the value of most canals. Various projects are now, indeed, on foot for converting some of the principal lines into railways, or for making them subsidiary to, or dependent on, the latter.

The *bridges, aqueducts, and tunnels*, which have been erected in connection with roads, canals, and railways, are more magnificent and numerous than those of any other country in the world. To estimate their number would be difficult; but we may mention, that, in London, the Waterloo and London Bridges alone cost very nearly £2,500,000 of money. The iron bridges which have been erected in different places, are the admiration of all foreigners. Their arches are constructed of a number of strong ribs of metal, standing apart from each other like the joists of a house, and on these the floor or roadway is formed. Bridges of suspension are now also common, in which the roadway is suspended by iron bars, from strong chains which are fixed in the earth, and then hung over high pillars at each end of the bridge; by this means bridges can be constructed over deep and broad waters, where it would have been altogether impossible to stretch an arch of any other kind. On a well-frequented road, bridges costing £14,000 or £18,000 are often constructed merely to shorten the distance by a mile or two, or to avoid an inconvenient ascent in the old track. Were it possible to estimate the amount of capital laid out on this kind of improvement alone, it would be almost incredible. (See INLAND CONVEYANCE, Vol. I.)

*Railways*.—From an analysis of the traffic of Great Britain, given in the report of the Commissioners of Railways to Parliament in the year ending June 1847, it appears that in that year there were conveyed by railways—47,484,134 persons; 7,000,000 tons of merchandise and goods; 8,000,000 tons of coal; 500,000 horned cattle; 1,500,000 sheep; and 100,000 horses. In the same year the average distance travelled by each person by railway was 16 miles. The gross receipts of 3207 miles of railway in the year ending June 1847 amounted to £8,326,772 (excluding Irish lines), or at the rate of £2596 per mile. The capital expended on British railways up till the end of 1848 is estimated at about £200,000,000; and when all now in course of construction are completed, it is calculated that the

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

gross annual revenue will exceed £15,000,000! In 1843 the revenue from 1798½ miles of railway was £4,535,189; in 1845, 2118½ miles yielded £6,209,714; and in 1847, 3207 miles produced £8,326,772—an increase which points out in the most forcible manner the energy, power, and capacity of our country. Connected with most of the lines of railway are electric telegraphs, either for conveying despatches in connection with the working of the lines, or for the purpose of public communication. The recent adoption of these adjuncts prevents anything like full or accurate statistics; but some idea of their importance may be gleaned from the fact, that any ordinary business transaction between parties in Edinburgh and London can be commenced, negotiated and completed in the brief space of a couple of hours!

**Docks, Piers, and Lighthouses.**—Docks are artificial basins built of stone for the reception of ships: they are of two kinds—wet and dry. A dry dock is a receptacle where vessels are built or repaired; after which the tide is admitted by flood-gates, and they are floated out to sea. Wet docks are constructed for the use of ships when loading and unloading, it being found that when they are allowed to settle down unequally on the mud or sand of rivers and harbours, their timbers are strained, and the vessels considerably damaged; in the wet docks they are kept always afloat. The sums laid out by some of the dock companies in London are immense. The capital expended by the London Dock Company in purchasing ground (chiefly the sites of houses and streets) was more than £1,000,000; and the whole cost of the works was £3,938,310.

The docks at Liverpool have an area of water of about 112 acres, and the quay space is nearly eight miles in total length. The business transacted may be conjectured from the fact, that the dues paid by vessels entering the docks in 1840 was £197,477, 18s. 6d. Few of the large seaports are without the accommodation which docks yield to commerce; those at Leith contain ten acres of water-room, and have cost £285,108. It would be idle to attempt a description or even enumeration of the immense number of piers and harbours which have been constructed at the different seaports. At every place where the profits of trade seemed to authorise such erections, capital was seldom deficient to complete them.

The *lighthouses* of Britain are perhaps the most remarkable part of the nautical apparatus of the islands. The capital expended upon them has been large, and the skill with which some of them, such as the Bell-Rock and Eddystone lighthouses, are constructed for durability in the midst of a tempestuous sea, could only have been exhibited in a country where mechanical science existed in its highest perfection; and there is hardly a dangerous or doubtful point along the coast where the mariner is not guided by a light on some headland or rock. There is, however, much complaint concerning the dues levied from ships for lighthouse expenses; some of them are held as profitable tolls by private families, and in others the money levied is applied to purposes quite unconnected with lighting.

### COLONIAL POSSESSIONS.

The foreign possessions of the United Kingdom are infinitely more extensive and populous than the home country. They are about forty in number, reckoning all classes of foreign stations and possessions, and lie in every quarter of the globe. The oldest existing colonies of Britain are those of the West Indies, consisting of a number of the islands so called, the district of Honduras, or Belize, on the adjacent coast of North America, and Guiana in South America. These possessions are rich in every tropical produce, yielding sugar, coffee, tobacco, cotton, cabinet timber, spices, fruits, drugs, and dye stuffs. Jamaica, the largest and most important of these islands, has an area of more than 5000 square miles, with a population of 380,000, of which only about 38,000 are whites, the majority being negroes, most of whom were originally slave-

labourers. Trinidad, St Lucia, Dominica, Barbadoes, and the other islands belonging to Britain, may contain an aggregate area of 83,000 square miles, with a population of about 460,000, of which the greater proportion are negroes and creoles. Belize is a small territory; but Guiana has an area of 67,000 square miles, with a population of more than 100,000.

Since the independence of the North American states in 1776, the British possessions in that continent lie wholly in the northern section, embracing the province of Canada, the colonies of Nova Scotia, Cape Breton, Prince Edward's Island, New Brunswick, and Newfoundland, and the vast region stretching to the Polar Ocean, at present occupied by savage tribes and the trappers of the Hudson's Bay Company. The staple products of these possessions are timber, hides, fish, furs, and flour. The population, amounting in all to somewhat more than a million and a-half, consists chiefly of British emigrants and their descendants, with a preponderance of French in Lower Canada, which was originally colonised by that people.

In the Asiatic continent, 500,000 square miles of the peninsula of Hindoostan, containing a population of 100,000,000, have, in the course of the last century and the present, fallen under the power of the association of English merchants called the East India Company, who, by virtue of a charter from the government, administer the affairs of the natives, in whose revenue they enjoy a source of vast wealth. A still larger portion of the country is under the protection, but not the direct government, of the Company. The island of Ceylon, situated at the southern promontory of Hindoostan, and containing an area of 24,450 square miles, with a population of 1,250,000, is now one of the most valuable of British possessions; it is a free colony—that is, not connected with the East India Company—and is rapidly improving. Besides these, Britain likewise possesses certain districts beyond the Ganges, as Assam, Aracan, some small settlements on the Tenasserim coast and in the Straits of Malacca. The whole of these are known by the common appellation of East Indies; and from their geographical position, yield every species of tropical produce, as sugar, coffee, tea, rice, silk, cotton, hardwoods, ivory, spices, fruits, drugs, dye stuffs, and the like. Goods to the value of more than £6,000,000 sterling are annually exported from Britain to the East Indies; while goods to the value of more than £8,000,000 are imported from the East Indies to Britain.

In Australasia, the British settlements are those of New South Wales, established in 1788; Swan River, in 1828; South Australia, in 1834; and North Australia, in 1838. The adjacent island of Van Diemen's Land (which contains 24,000 square miles, or somewhat less than Ireland), is the seat of another British colony, planted in 1824, and is altogether a thriving settlement—being more hilly and better watered than Australia. New Zealand, composed of three contiguous islands, ranging from 1100 miles in length, with a breadth varying from 5 to 200, is also the seat of a British colony planted in 1840; and if its internal management were once fairly adjusted, it would probably rise to first-rate importance. The staple products are wool, hides, hardwoods, grain, and copper.

At the Cape of Good Hope, Sierra Leone, Cape Coast, and other parts of Africa, Britain possesses upwards of 200,000 square miles, with a population of 350,000. Cape Colony, taken from the Dutch in 1806, is a thriving settlement, and may be said to be the only spot on the vast continent of Africa in which modern civilisation has been successfully planted. The Mauritius, and some minor islands in the Indian Ocean, the rocky islets of St Helena and Ascension in the Atlantic, and Fernando Po in the Gulf of Guinea, constitute the sum of British possessions connected with Africa. Their principal products are ivory, gold, hides, horns, sugar, coffee, palm oil, teakwood, aloes, &c.

The Ionian Islands, the isles of Malta and Gozzo, and the town and fortress of Gibraltar, in the Mediter-

## CHAMBERS'S INFORMATION FOR THE PEOPLE.

ranean, the islet of Heligoland in the German Ocean, the peninsula of Aden on the south coast of Arabia, the islet of Hong-Kong at the mouth of the Canton river in China, the island of Labuan off the coast of Borneo, and the Falkland Islands in the South Atlantic, constitute the sum of British foreign possessions and dependencies.

All are free crown colonies except Hindoostan, which is governed by, and under tribute to, the East India Company; the Company, however, being in some measure controlled by the supreme government and the high functionaries whom it appoints. With the religion and law of England have been generally introduced the English language, usages, and manners. The colonies possess little or no independent power. They are locally managed by governors and other functionaries appointed by the crown, and are subject to numerous regulations imposed by the imperial Parliament, or by the colonial secretary. Canada, Nova Scotia, New Brunswick, Newfoundland, Jamaica, and other West Indian possessions, and the Cape of Good Hope, individually possess local legislatures, or parliaments, by which various internal concerns, such as making roads, education, imposition of dues on shipping, &c. to defray expenses, are managed. The colonies are not taxed to support the home government, it being a principle in the constitution that there can be no taxation without representation; but they are subjected to various customhouse duties and restrictions, that greatly limit their capacity for improvement. All the raw produce they can export, such as sugar, coffee, timber, &c. is permitted to enter British ports at a duty much lower than the same kind of produce from foreign countries. This preference is in one respect advantageous to them; however, they are at the same time restricted in the purchase of various articles, except from Britain and its possessions. They are also prevented from manufacturing certain kinds of produce; for example, the inhabitants of Jamaica cannot refine their own sugar, but are compelled to send that article to England to be refined, and then buy it back again. By these arrangements the colonies are, generally speaking, in a state of tutelage, and cannot, without a very great change in their affairs, start forward in a course of prosperity; while we at home, by being compelled to pay for their protection, and to buy their high-priced produce, receive no adequate benefit from their possession. The ostensible object of maintaining a connection with the colonies, is to find an outlet for British manufactures, and to employ shipping in the transport of goods. It is, however, extremely doubtful whether the expense incurred in supporting them is not much greater than all the profit derived from commercial intercourse. From the complicated method of keeping the public accounts, it would be impossible to present a connected statement of outlays on account of the colonies; we shall therefore merely select a variety of entries from different Parliamentary reports, aided by information from other sources, in order to give a general idea of the expenses incurred. The following appear for the greater part in the accounts for 1847, and unless otherwise expressed, refer only to one year:—

Expenses of the Colonial Office, L.10,134. Paid to clergy in North America, L.11,578. Indian department, Canada, L.15,000; militia and volunteers in Canada, L.15,000. [Under this head, from 1837 to 1847, L.3,166,746.] Salaries of governors and others in West Indies, L.14,384. Magistrates, West Indies, L.41,600. Ecclesiastical establishment, West Indies, L.20,300. On account of the civil governments—Bermudas, L.4012; Prince Edward's Island, L.1534; Nova Scotia, L.400; Falkland Islands, L.3480; Bahamas, L.3410; Heligoland, L.1023; Port Essington, L.1240; Hong Kong, L.50,000 [from 1841 to 1846, L.314,000]; Western Australia, L.7219; Labuan, L.9827. Lighthouses, Newfoundland, L.4000. Colonial naval yards, L.48,913; victualling establishments, L.9359; medical establishments, L.9555; repairs and new works, L.197,455. Transport of men and stores, &c. L.267,690. Expenditure on Gibraltar and Malta in 1843-4, L.360,000; works in progress there will cost L.460,000. Expenditure in protecting the Ionian Islands, about L.130,000 per annum [value of the whole exports to them in 1844, L.123,288]. Military expenditure on Cape of Good Hope in 1843-4, L.258,000;

naval expenditure, L.170,000—total, L.428,000. Expenditure on Mauritius in 1843-4, L.92,000; expenses for defences about to be incurred, L.150,000. Military expenditure in New Zealand in one year, L.370,000; cost of civil government, L.36,000—total, L.306,000, which is at the rate of about L.90 a-head of the British population. Altogether, the direct expense of the mother country on account of the colonies may be safely set down at L.4,000,000.

All the expenses, troubles, and anxieties incurred on account of the colonies are believed, we have said, to be compensated by their purchase of our manufactures, their reception of emigrant settlers, and the employment of our shipping. These supposed advantages may be examined separately. The declared value of British and Irish produce and manufactures, exported to the colonies from the United Kingdom in 1847, was

Heligoland, . . . . .	L.250

Total Exports, . . . . .	L.8,902,369

*Under nine millions* for the whole, even taking into account the military dependencies. Therefore, for every pound's worth of goods exported by our merchants, the country, in the form of taxes, pays 9s. But as it loses also at least £3,000,000 on account of differential duties, it may be said to give £7,000,000, in order to sell articles to the value of £9,000,000. It could be shown, however, that the colonies would continue to buy from us were the connection dissolved, or greatly changed in character. The United States of America once were colonies, and the trade with them has vastly increased since they became independent. While they were colonies, the exports to them were latterly under £1,500,000; now they are upwards of £10,000,000 per annum, and require from us neither defence nor management. With regard to the outlet which the colonies afford for our population, it appears, says Sir William Molesworth, 'that in the course of the last twenty years, 1,673,803 persons have emigrated from this country, of whom 825,564 went to the United States, 702,101 to the North American colonies, 127,188 to the Australian colonies, and 19,090 to other places.' One-half of all our emigrants, therefore, proceed to a country which is not under our jurisdiction; nor does it appear that the colonies are preferred by the other half in consequence of their connection with the British government. Large numbers of those who emigrate to Canada proceed afterwards into the United States. We have not seen any statement of what benefit is derived by British shipping from the colonial connection; but whatever it is, there can be no doubt that the same number of ships would be employed in the export and import trade, if the colonial connection was dissolved. In fine, reckoning the expense of military, naval, and civil protection, along with the heavy loss incurred by our obligation to buy their dear produce, it is calculated that in ordinary times the people of Great Britain lose between five and six millions annually by the colonies.

India is not, strictly speaking, a colony or possession of Britain. Politically it belongs to the Honourable East India Company, an association of British merchants, by whose servants it has been conquered, and is now locally governed, under the control and approval, however, of the crown, and a charter granted by the legislature. In virtue of an act of Parliament passed in 1833, the East India Company is guaranteed the government of the British territories in India until April 1854; the company is not to carry on any trade; commerce to be open to British merchants; natural-born subjects of England may proceed

## CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE.

to, settle, and buy lands in India; and natives of India, of whatever colour or religion, are to be eligible to office. India affords no direct revenue or tribute to England, as conquered countries are in general supposed to do. The only advantages which we derive from our occupation of these immense countries, are the undisputed possession of their trade, and the fortunes (sometimes very large) saved out of their salaries by British subjects who are appointed to discharge the duties of government. It is to the trade of the country, however, that we must look for any considerable and permanent advantage; and as this can only be made to increase by the cultivation of peace and order through the country, the interest of Britain becomes directly involved in maintaining henceforth the peace of India. The improvement which a few years of peace effects in these fertile countries is astonishing: the population of a certain portion is supposed to have nearly doubled in the period of comparative peace from 1811 to 1830, being in the former year only forty-five, and in the latter almost ninety millions. Till she came under British rule, India never enjoyed twenty years of peace and orderly government in all her former history. Many faults and oppressions are laid to the charge of the English in India, from which it is impossible to defend them. The taxes (which fall chiefly upon the land and the poor peasantry) are very oppressive, and are rendered more so by the unprincipled conduct of the natives who are employed to collect them. Justice also is administered in a foreign language (Persic), and the courts are so few, that districts which are larger than Scotland have hardly one to each. Notwithstanding all this, the preservation of public order and of peace has conferred advantages on the country of the most inestimable kind. Latterly, considerable improvements have been effected by the establishment of schools, and by Christian missionaries.

As India, by the taxes which it pays to the Company, clears the cost of its own protection, and all its other public expenses, it may be considered as the only foreign possession of Britain whose trade affords an unburdened profit to the home country. The forces employed by the Company, partly composed of British regular troops, and partly of native levies, amounted in 1846 to 250,000 men. In 1833-4, its annual revenue was £13,680,165, an enormous sum to be raised in a semi-barbarous country, yet no more than sufficient to discharge the annual expenses. The Company at that time was in debt to the amount of £35,463,483.

### POPULATION—SOCIAL STATISTICS.

The people of England, Scotland, and Ireland, respectively, possess certain national peculiarities of character; but these, from the general intercourse which now prevails, are gradually disappearing, and a uniform British character is becoming daily more apparent. In this general and happy assimilation, the English qualities of mind and habits predominate. The chief feature in the English character is an ardent love of liberty, which renders the people extremely tenacious of their civil rights, stern advocates of justice, and patriotic in the highest degree. In their manners they are grave rather than gay, blunt rather than ceremonious. In their habits they are enterprising, industrious, and provident; in their feelings humane. In all mercantile transactions the greatest integrity exists, and promises are faithfully performed. In the middle and upper classes the highest civilisation prevails, and all the social virtues and comforts of domestic life are sedulously cultivated. There are some favourite field-sports and boisterous amusements; but the enjoyments of the English are chiefly within doors, in their own well-regulated homes. A love of home is a marked peculiarity in the affections of the English. The eminent importance attained by the British in the scale of nations, appears to depend mainly upon two features of the common character—the high moral and intellectual character of the people at large, and their extraordinary skill in producing articles of necessity and

luxury, as well as their dexterity in the commerce by which these are diffused over the world.

An account of the population of the empire has been taken at intervals of ten years from 1801; and the following table will show the gradual increase which has occurred since 1811:—

	1811.	1821.	1831.	1841.
England and Wales, 10,163,676	11,978,675	13,894,469	15,906,741	
Scotland, . . . . .	1,806,688	2,083,456	2,365,807	2,630,610
Ireland, . . . . .	4,500,000	6,802,003	7,734,365	8,175,124
Totals, . . . . .	16,469,664	20,874,424	23,994,741	26,702,475

These estimates are exclusive of the army and navy, as also of the Channel Islands and the Isle of Man, which are noticed under another section. The increase of the population, as compared with the returns of 1831, is at the rate of 14.5 per cent. for England; 13 per cent. for Wales; for Scotland, 11.1; for the islands in the British seas, 19.6: making the increase for the whole of Great Britain 14 per cent., being less than that of the ten years ending 1831, which was 15 per cent.

The following is the latest statement of the extent and population of the British Empire:—

Colonial and Foreign Possessions.	Square Miles.	Population.
England and Wales, . . . . .	57,812	15,906,741
Scotland, . . . . .	32,167	2,630,610
Ireland, . . . . .	32,512	8,175,124
Man and Channel Islands, . . . . .	339	124,040
European Dependencies, . . . . .	145	140,282
Asiatic do. . . . .	754,687	95,010,000
African do. . . . .	34,687	1,445,379
North American do. . . . .	754,880	1,880,000
South American do. . . . .	89,000	103,269
West Indies, . . . . .	78,384	792,908
Australasia, . . . . .	560,000	370,000
Protected and Tributary States—		
Ionian Islands, . . . . .	1,041	223,346
East Indian States, . . . . .	560,000	38,900,000
Total, . . . . .	3,146,747	166,278,641

**Occupations.**—It appears that those engaged in the close and vigilant pursuits of manufactures and merchandise are, in England and Scotland, as two to one in numbers, compared with those who apply to the more leisurely business of agriculture. In 1841 the number of those in active life or living independently were 7,846,569—leaving 10,997,865 to be understood as women and children having no recognised occupations. Of those employed—3,110,376 were engaged in commerce, trade, and manufactures; 1,499,278 in agriculture, grazing, gardening, and other kindred pursuits; 761,868 in miscellaneous labour, as mines, quarries, portage, &c.; 218,610 comprised the navy, national and mercantile, fishermen, watermen, &c.; 131,464 the army at home and abroad; 63,184 were engaged in the learned professions—divinity, law, and physic; 142,836 were following pursuits requiring education, including those engaged in imparting knowledge to others; 16,959 were in the civil service of government; 25,275 were in municipal and parochial offices; 1,165,233 were in domestic service; 199,069 were alms-people, paupers, lunatics, and pensioners; 511,440 were returned as independent; 2424 were afloat and undescribed; leaving a residue of 10,996,398, in respect of whose occupations no particulars were given. The number of persons engaged in, and dependent upon, agriculture in Ireland, is comparatively much larger than in Great Britain. It appears from the census of 1841, that there are 5,358,034 persons directly dependent upon the culture of the soil out of a population of 8,175,124; and taking into account its subsidiary employments, the dependence on agriculture will even be proportionally greater.

In considering the number of persons supported by any particular manufacture, it is to be remembered that the numbers given are of actual workers, and not of those who, as wives, children, &c. are supported by the labour of others. The total number of persons

whose occupations were ascertained in Great Britain was 7,846,569, leaving 10,997,865 as the 'residue' of the population, which must be taken to consist of persons dependent on the former. Therefore, to the number given under each employment, we must add another number bearing to it the proportion of about 11 to 8, in order to ascertain the entire number of individuals whom that branch of industry supports. It is worthy of remark, that, from other reports, the proportion of those workers who are of tender age is decreasing, and the total number of children now engaged in the above occupations is only 31,566, under 1-24th of the whole workers. The largest number returned under any one occupation is of domestic servants, being 1,165,233, of whom 908,825 are females.

The statement of the aggregate population of the British islands, affords no idea of the force which is actually employed in agriculture and manufactures. The effective labourers (men) are estimated to amount to no more than 7,500,000, whereas, reckoning the powers exerted in productive industry by animals, mills, steam-engines, and mechanism of various kinds, the force is equal to the strength of between 65,000,000 and 70,000,000 working-men.

*Dwellings.*—The number of houses in England in 1841 were—inhabited, 2,753,295; uninhabited, 162,756; building, 25,882. The number in Wales, inhabited, 188,196; uninhabited, 10,133; building, 1769. In Scotland, inhabited, 503,357; uninhabited, 24,307; building, 2760. In the islands of the British seas, 19,159 inhabited; 865 uninhabited; and 220 building. Grand totals for the whole of Great Britain, 3,464,007 inhabited, 198,061 uninhabited, 30,631 building—altogether, 3,692,679 houses. It appears from the census, however, that in Great Britain on the night of the 6th June 1841, that 22,303 persons slept in barns, tents, pits, and in the open air.

*Vital Statistics.*—England is now provided with a law for enforcing the registration of births, marriages, and deaths; but in other parts of the empire, Scotland in particular, the arrangements for these useful objects are very imperfect, and demand speedy amendment. At the celebration of marriage, parties are required to sign their names; and it appears that, on an average, 33 in the 100 of males, and 49 in the 100 of females, sign with a mark, being unable to write. The average age of men in England at marriage is about 27 years, and of women, 25 years and a few months. Of 100 marriages, 8 take place with both parties under age; and it is remarkable that the agricultural districts furnish the greatest proportion of early marriages. The average annual number of marriages for England and Wales to every 10,000 inhabitants is 78. The average of births to every 10,000 for England and Wales is 319; of deaths, 221. It may be worth noticing, that it is in the maritime counties we find the least mortality.

*Pauperism—Crimes.*—The population of the United Kingdom thus consists of various classes of persons, amongst whom, with respect to wealth, education, and general condition, even more than the usual differences are to be found—the greatest wealth and luxury contrasting with the most abject poverty and want, and the most industrious prudence with the utmost negligence and want of self-respect. Without entering minutely into the political and social causes of this distressing difference, it may be mentioned as a general result, that the difficulty of purchasing food leads to a corresponding depression of circumstances in the humbler orders of the community, and either causes an extensive dependence on poor-rates for support, or produces debased and dangerous habits of living. The poor of England are entitled by law to support in workhouses, according to the provisions of an act of Parliament passed in 1834. In 1847, the number of paupers (including children) relieved in England, was 1,721,350, or about 1 in 9 of the population. Of these 265,037 received in-door relief; 1,456,313 received out-door relief. The amount received was £7,117,352: of which £5,298,787 was expended on the

poor—£899,095 on in-maintenance, and £3,467,960 on out-relief.

In Ireland, similar poor-laws were introduced in 1838, and are likely to prove of great service to that part of the empire. 'The chief peculiarity of these laws,' says Macculloch, 'is that relief under them is administered solely in workhouses; and thus they differ from the Scotch poor-laws, under which workhouses have scarcely been made use of at all, except in a few large towns; and from the English poor-laws, which were intended by the legislature to be a mixed system of relief to the able-bodied in workhouses, and of relief to the impotent poor, partly in workhouses and partly at their own homes. They differ again from the English and Scotch poor-laws in this, that while in England all destitute persons have a legal right to relief, and in Scotland all destitute impotent persons have a similar right, in Ireland, on the contrary, no individual was intended to have a legal right to relief; but at the same time, whether able-bodied or impotent, he may equally receive relief in workhouses, provided he is destitute.' Under this law, the expenditure for the poor in Ireland for the year ending 1st January 1846 was £316,026, and the number of paupers 43,293; but in November 1846, in consequence of the potato failure, the number was 80,600.

In Scotland, as above stated, only the impotent or very aged poor can legally claim relief from the parish funds, which, by a recent act, are managed by parochial boards, subject to the direction and control of a Central Board, which is established in Edinburgh. In 1846-47, the number of paupers on the roll or registered was 85,971; casual poor, 60,399—making the number of persons receiving relief in Scotland during the year, 146,370, or about 1 in 18 of the population. The amount received was £435,367: of which £336,515 was expended on registered poor; £36,340 on casual poor; £12,879 on medical relief; £43,158 on management; and £5022 on litigation.

The present condition of society throughout the United Kingdom exhibits the spectacle of great and valuable efforts at improvement among the more enlightened classes. Within the last twenty years, the utility of the press has been immensely increased, and works of instruction and entertainment have been circulated in departments of society where formerly nothing of the kind was heard of. The establishment of mechanics' institutions, lyceums, exhibitions of works of art, reading societies, and other means of intellectual improvement, forms another distinguishing feature of modern society. At the same time great masses of the people, for lack of education, and from other unfortunate circumstances, are evidently gravitating into a lower condition. From these reasons, and others connected with the development of our manufacturing and commercial system, convictions for crime have been latterly increasing. In 1847 there were in England 28,833 offenders, of whom 21,582 were convicted; in Ireland 31,209,\* of whom 15,257 were convicted; in Scotland 4635, of whom 3569 were convicted. Of the offences, 7611 were committed against the person; 4747 against property committed with violence; 43,367 against property without violence; 589 malicious offences against property; 835 forgery and offences against the currency; and 7528 other offences not included in the above. In reference to these details, it must be remarked that the vigilance of our police brings to light almost every offence, however trivial; and it is to this certainty of detection, together with the general spread of education, the establishment of industrial schools, and the introduction of an improved treatment of offenders, that we look forward to some diminution of this painful catalogue of crime.

\* The remarkable amount of crime in Ireland during the year 1847, is attributed, in the explanations which accompany the official returns, to 'the famine which prevailed for that entire period, and the social disorganisation consequent on a state of universal distress.' In 1846, the number of offenders was only 18,498; and in 1845, 16,696.

# EUROPE.

REFERRING the reader for all that appertains to the general constitution of the globe to our article on PHYSICAL GEOGRAPHY (No. 4), we purpose, in this and several following sheets, to direct attention to the special features of the respective continents—describing their territories and states, their natural products, their commercial industry, population, laws, religion, and

other topics usually comprehended under the title of POLITICAL GEOGRAPHY. In doing so we shall endeavour to be as systematic as possible, believing that we shall thereby communicate not only a larger amount of information, but render that information more precise and accurate, and more readily available for the purposes of reference and comparison.

Constituting but a fragment of the Old or Eastern World, and being surrounded on more than three sides by water, Europe, strictly speaking, is not entitled to the appellation of an independent continent. But though the smallest of the *quarters* into which geographers have divided the globe, it is by far the most important—its inhabitants giving now, as they have long done, the tone and character to human progress. Its limits are usually comprehended within the 36th and 71st degrees of north latitude, and the 10th degree of west and 64th of east longitude; thus placing it almost wholly within the northern temperate zone. Including the islands, which contain about 317,000 square miles, the land superficies of Europe is estimated at 3,724,000 square miles; its population at nearly 240,000,000. At present (1849) it is divided into fifty-eight states; a few of which, however, are not altogether independent. The leading states, usually styled 'the Five Great Powers of Europe,' are Great Britain, France, Russia, Austria, and Prussia. Those of a secondary rank are Spain, Sweden, Denmark, Holland, Belgium, Portugal, Naples, Bavaria, Sardinia, Saxony, Hanover, the Swiss Confederation, and Turkey. Those of a third rank are the small constituent principalities of Germany and Italy. It is to the conti-

mental or foreign states that we now confine our description, reserving the component parts of the United Kingdom—England, Scotland, and Ireland—for treatment in the three subsequent numbers.

## FRANCE.

France, one of the largest and most important of the European states, is situated between lat. 42° 20' and 51° 3' north, and long. 3° 51' east, and 9° 27' west. It is bounded on the north by the English Channel, Straits of Dover, Belgium, the Prussian province of Lower Rhine, and Rhenish Bavaria; on the east by Baden, from which it is separated by the Rhine, by Switzerland, and Italy; on the south by the Mediterranean and by Spain, from which it is separated by the Pyrenees; and on the west by the Atlantic. The greatest length of the country is 664 miles, and its breadth 620; its area, including Corsica and the islands\* which stud the sea-coast, is estimated at 203,736 square miles.

\* The *Channel Islands*, though geographically connected with France, have been an appendage to the English crown since the eleventh century. The group consists of Jersey, 12 miles by 5 or 6; Guernsey, 9 miles by 6; Alderney, Sark, and several other islets and rocks of small extent. The larger of these islands are fertile, and well diversified by orchards, clumps, and hedges; and

*Superficially*, France may be described as a flat country, the greater portion consisting of valley-like tracts or open plateaux, with low hilly ranges or swelling eminences between. Its scenery, therefore, exhibits little of the romantic and picturesque, and with the exception of the Limousin, and some of the larger river courses, is, on the whole, rather flat and uninteresting. The principal hills which diversify the surface are—

1. The Vosges, on the north-east, presenting rounded outlines, with gentle slopes, and affording much open pasture; the highest point 4693 feet.
2. The Jura Mountains, lying south of the Vosges, and forming part of the boundary between France and Switzerland, the extreme height of which is about 6000 feet.
3. The Cevennes, and other portions of the long range which forms, as it were, the western brim of the valley of the Saone and Rhone: the highest points do not exceed 5000 feet. This range may be said to form the great water-shed of France, from which all the large rivers flow in a north-west direction to the Atlantic.
4. The clustering hills of Auvergne, or central France, remarkable for their crateriform tops and recent volcanic origin, the highest of which is Puy de Sancy, 6200 feet. The largest and best-defined *river-basins* or *valleys* are those of the Saone and Rhone on the east, which may be regarded as one; those of the Adour, Garonne, Lot, and Dordogne on the south and south-west; those of the Loire and Seine in the centre; and those of the Somme, Meuse, Moselle, and Rhine on the north. The soil of most of these valleys is a fine deep alluvium, with a greater or less admixture of sand: some, like the Limousin in Auvergne, are of unsurpassed fertility; and all, under proper cultivation, are capable of yielding the ordinary crops in more than average abundance. There are large tracts of heath in Bretagne, Anjou, and Maine; and the Atlantic sea-board presents in many places, as in Landes, wide expanses covered with sand-dunes and intervening marshy lagoons, on which nothing useful can flourish except the sea-pine, planted there to protect the surface from further drift.

The great rivers exclusively French have all a westerly flow towards the Atlantic; those flowing northward—the Scheldt, Sambre, Meuse, Moselle, and much-coveted Rhine—have only the upper and least valuable portions of their courses in France; and the Rhone, the sole large river running southward, has also a great portion of its course in another country. Of those flowing westward, the following are the most important:—

1. The Seine, navigable to Rouen for vessels of 200 tons, and for barges more than 300 miles inland.
2. The Loire, the largest river belonging exclusively to France, which, although it receives numerous tributaries, and possesses a considerable volume of water, is of remarkably little use in commerce, and can only carry small barges and steam-vessels; a defect resulting from numerous sandbanks.
3. The Garonne, which is navigable for barges about 280 miles of its course, and receives a vast number of tributaries. The Rhone during its course in France is a noble, but rapid river, and though much obstructed by shoals and shifting sandbanks, is navigable for flat-bottomed steamers to Chalon-sur-Saone, a distance of 275 miles from Marseilles.

*Geologically*, says one authority, 'the whole of France may be considered as one extensive basin, the circumference and centre of which consist of primitive formations, the intermediate space being filled with those of a secondary and tertiary kind.' Taking this statement as a mere proximate outline, we find primary rocks in the Ardennes on the north; in the Vosges, Jura, and Alpine ridges on the east; in the Pyrenees on the south; in Bretagne, Maine, and Normandy on the west; and, centrally, in the hilly ranges of Auvergne. Lying upon these in many places, without the intervention of the transition and older secondary strata, occur the coal-measures, the oolite lime—they enjoy exemption from almost every species of taxation, have a considerable commerce, and are favourite resorts for persons with limited incomes. Area of the whole, 113 square miles; population in 1841, 76,004.

stones and shales, and the chalk; and not unfrequently even the coal-measures are absent, and the oolitic and chalk repose immediately on the upper primaries. The tertiaries generally occupy the great river drainage of the centre, showing that at no very distant epoch a large portion of France was a shallow sea or estuary of deposit. The chief *minerals* are—coal from upwards of forty indifferent fields, not exceeding 2,800,000 tons annually; iron largely from ten or twelve districts; rock-salt from Lorraine; gypsum, or plaster of Paris, in unlimited quantities; asphalt from Seyssel and the Jura; abundances of limestone, slate, and granite; excellent marble and building stones; mill or burr-stone; lithographic slate; graphite, jet, and alum; and a large supply of first porcelain, and other clays. With the exception of iron, the other metals are of no great commercial importance; the total value of lead, silver, antimony, copper, manganese, arsenic, &c. annually produced rarely exceeding £60,000.

The *climate* of a country whose extreme limits lie between the 42d and 51st parallels of north latitude—whose western region is subject to the influences of the vast Atlantic, while its central and eastern, exempt from these influences, are subject to those of a higher elevation—must necessarily exhibit considerable diversity. Geographers have accordingly divided the whole into four regions—namely, 1. The most southerly, in which the vine, olive, mulberry, and orange flourish, bounded north and west by a line drawn from Bagneres-de-Luchon in the Pyrenees to Die in Drôme; 2. That through which the cultivation of the vine and maize extends, stretching as far north as a line passing from the mouth of the Garonne to the northern extremity of Alsace; 3. That region which terminates with the culture of the vine, near a line drawn from the mouth of the Loire to Metziers in Ardennes; and 4. The remaining portion of the country, having a climate somewhat allied to that of England, and yielding rich verdant pastures and forest growth. Along the entire western coast the climate is distinguished by a greater degree of humidity than in any other district; the south and east have about a third fewer rainy days than the north and west; winter is often pretty severely felt in the north-east; and though snow seldom lies in the central and southern regions, yet these are liable to destructive hail and thunder-storms, as well as to sudden inundations.

The *native vegetation* of the country, though numbering several thousand species, contains few, with the exception of the apple, pear, plum, and fig, that are of much economical importance. The existing Flora, however, is one of great variety and value, embracing exotics from almost every region of the globe, which have become readily naturalised in its fine soil and under its genial climate. Of grains and vegetables largely cultivated, we may enumerate wheat, rye, oats, maize, millet, buckwheat, kidney-beans, pease, carrot, beet, melons, potatoes, flax, hemp, and tobacco; and madder, saffron, and hops on a smaller scale. Of fruit-trees, the vine, olive, orange, pistachio, fig, apple, pear, plum, peach, apricot, and cherry, with which we may also class the mulberry and caper. Of forest-trees, the oak, beech, maple, ash, chestnut, walnut, birch, poplar, larch, pine, fir, box, cornel, acacia, and cork-tree. As a certain consequence of climate and soil, these plants are not found indifferently all over the surface, but are restricted to peculiar localities, where they meet with conditions necessary to their growth and perfection, or where, through accidental causes, they have become objects of especial culture. The forest growth of France is said to cover fully one-eighth of the entire surface, or about 17,000,000 British acres—an amount which is rendered necessary by the use of wood as the chief domestic fuel.

Of the *mammals* found wild in France, the principal are—the black and brown bears of the Pyrenees, the wolf, the fox, the lynx of the Alps, the chamois and wild goat of the eastern and southern hills, the wild boar, badger, otter, marmot, ermine, and hamster.

The birds belonging to, or at least frequenting France, are exceedingly numerous—the becaico or fig-pecker, the ortolan, quail, bustard, flamingo, hoopoe, turtle-dove, nightingale, &c. being the chief of those least known to English readers. Of reptiles, the viper, asp, snake, and lizard; the edible frog, and other varieties of the frog and toad; the fresh-water tortoise of the southern rivers, and the green turtle taken occasionally on the southern sea-coasts. The fishes and mollusca, with the exception of the mullet, sardine, carp, horse-foot oyster, and edible snail, are much the same as those belonging to England. The insects of any economical importance are the bee, silk-worm, gall-nut fly, and the blistering fly. Respecting the breeds of the domesticated animals, if we except the merino sheep and poultry, it may be safely asserted that they are all inferior to those of Great Britain.

The inhabitants are generally arranged by ethnologists under five distinct heads or races:—1. The French proper, constituting nine-tenths of the population, and consisting subordinately of the Græco-Latins or French, north of the Loire, and the Romance, south of that boundary; with whom may be classed the Italians of Corsica; 2. The Germanic races of Alsace and Lorraine, and the Flemings of the north; 3. The Celtic or Cymric race (Bretons) of Bretagne; 4. The Basques of the Low Pyrenees; and 5. The Jews, who are found in all the principal towns. There are thus six distinct languages spoken within the kingdom—French and Italian (both of Latin origin), German, Celtic, Basque, and Hebraic; independent of several widely-differing provincial dialects of the French and German.

Though the Roman Catholic faith may be regarded as the national religion (five-sixths of the people being attached to it), yet no form of worship is expressly established or associated with the state. Reckoning the Catholic population at 28,210,000, and the Protestants at 6,010,000, the remainder may be regarded as consisting of Jews, Rationalists, Anabaptists, and other minor sects. Both the Catholic and Protestant clergy are paid out of the public revenue—the sum annually allotted for religious purposes amounting to nearly £1,172,000 sterling. With regard to education, the country may be said to be at present under the operation of an efficient and liberal system. By the law of 1833, it is ordained that every commune by itself, or by uniting with others, shall have one elementary school, independent of infant schools; that every commune with a population of 6000 shall have, in addition, a superior school; and that every department, either by itself, or by uniting with others, shall have a normal school. Above these are 350 communal or royal colleges supported by the state; and higher still are the 26 head or chief academies. These, collectively, form what is called the 'University of France,' which is under the superintendence of the Minister of Public Instruction, assisted by a council and a number of inspectors—the whole machinery requiring an annual outlay of about £520,000 sterling.

With respect to national industry, France may be regarded more as an agricultural than a manufacturing country. By the law of inheritance, the property of a father is divided equally among his children; and consequently there is a progressive tendency to more minute divisions and subdivisions of the land. The entire number of landed proprietors was lately 10,895,000, of whom about one-half were assessed at less than five francs annually. A vast number of the properties are under five acres in extent, and the result is a generally mean condition of rural affairs, and the total absence of all high-class systematic agriculture. According to Dombàle, the total produce of agricultural industry in France amounts to £199,200,000, of which £108,000,000 are derived from the bread-corns; £32,000,000 from the vine; £8,400,000 from live-stock and wool. The fisheries on the coast are not of much importance, the principal being those of pilchards, herrings, mackerel, oysters, and anchovies, employing in all about 5800 boats both in the Mediterranean and

Atlantic. The mining departments have been already alluded to; but though fostered in every manner, the coal raised does not exceed a tenth, and iron is somewhat less than a fifth, of that annually produced in Britain. In manufactures France ranks next to Great Britain, the estimated annual value of the goods produced amounting to £92,000,000: of which silk, £12,000,000; woollen, £10,600,000; cotton, £9,000,000; linen, £10,400,000; hardware, £8,700,000; leather, £3,000,000; glass, £1,200,000; paper, £1,000,000; and porcelain, £300,000. The minor manufactures of the country would be tedious to mention; most of them exhibit a greater degree of skill and ingenuity than is to be met with in any other country. Ship-building is carried on to some extent at Rochefort, Brest, Cherbourg, &c.; and in engine-building, and other heavy machinery, the French are now beginning to attain considerable eminence. The commerce of France has more than doubled since the peace in 1815, her imports now amounting to about thirty-eight, and her exports to thirty-nine millions sterling. Her mercantile navy is estimated at 15,600 vessels, carrying an aggregate burden of 700,000 tons. The internal communication of the country is carried on by well-kept roads; these being classed into royal, departmental, and communal, according as they are upheld by the government, or by the departments and communes to which they belong; by river navigation, of which there is upwards of 5816 miles; by 2250 miles of canal; and by railways, of which about 2000 miles are constructed.

The government of France, until the Revolution of 1848, was a hereditary, constitutional, or limited monarchy, with the succession restricted to males. The legislative power was vested collectively in the king and the two great national assemblies—the Chamber of Peers and the Chamber of Deputies. The executive was vested in a ministry, appointed by the king, as head of the state, and consisted of—1. Minister of the Interior; 2. Justice and Public Worship; 3. Public Instruction; 4. Public Works; 5. Trade and Agriculture; 6. Finances; 7. Foreign Affairs; 8. War; 9. Marine and Colonies. At present (1849) the government of France is Republican; the legislative power being vested in a Chamber of Deputies elected by universal suffrage; and the executive conducted by a President and Ministry, much in the same manner as under the monarchy.—Revenue said to be £47,000,000; present expenditure; £72,000,000; debt, £211,000,000; army, 385,000. Capital, Paris, with a population of 1,053,897.

For administrative purposes, France is partitioned into 86 departments, which are subdivided into 363 arrondissements, 2834 cantons, and 37,187 communes. At the head of each department is a prefect, named by the government; he is assisted by a council, which sits for a week annually to distribute the imposition of taxes, and decide on the wants of the department. In each arrondissement there is a sous-prefect, likewise named by the executive, and subordinate to the prefect: the sous-prefect is also assisted by a council. In each canton there is a judge de paix, with judicial functions in matters of inferior importance. In each commune there is a maire, assisted by adjoints.

#### SPAIN AND PORTUGAL.

These two perfectly distinct and independent kingdoms belong to a region so unique in character and situation, that we shall treat them, in regard to their physical geography, as one. This region, commonly known in Britain as 'The Peninsula,' lies at the southwestern extremity of the European continent, with which it is connected by an isthmus 230 miles broad, and is situated between lat. 36° and 40° north, and between long. 4° east and 10° west. It is bounded on the north by the Bay of Biscay, and by France, from which it is separated by the Pyrenees; on the east by the Mediterranean; on the south by the Mediterranean, the Straits of Gibraltar,\* and the Atlantic; and on the

\* The promontory, fortress, town, and bay of Gibraltar, situated

west wholly by the Atlantic. The only islands geographically connected are the Balearic—an important group, exhibiting in miniature all the characteristic features of the mainland. The area thus included is computed at 216,780 square miles, of which 182,270 belong to Spain, and 34,510 to Portugal.

In superficial character the Peninsula is decidedly mountainous. 'The interior may be considered as one vast table-land, from 1800 to 2600 feet above the level of the sea, traversed by numerous mountains, and intersected by rivers. Around this central nucleus extends a narrow belt of maritime low land, sloping gradually towards the sea, and broken into an alternation of hills and valleys, which produce a most agreeable variety of aspect, and present a pleasing contrast to the bleak and barren sameness by which the central region is characterised.' The geology of the country is but indifferently known. The principal economic minerals are—granite, marble, serpentine, common limestone, coal, rock-salt, gypsum, alabaster, meerschaum, and several of the precious stones; the metals—iron, lead, silver, mercury, tin, copper, antimony, and cobalt.

The principal rivers of the Peninsula are—the Ebro and Xucar, falling into the Mediterranean, both unnavigable; the Guadalquivir, Guadiana, Tagus, Douro, and Minho, discharging themselves into the Atlantic, and all forming channels of communication with the interior. In this respect the Guadalquivir is the most important, being navigable for vessels of 100 tons to Seville, and for flat-bottomed boats to Cordova.

The climate, as might be expected from the position and physical conformation of the region, is extremely diversified. All along the Mediterranean sea-board the temperature is mild and equable, seldom sinking below 32°, and generally ranging between 55° and 60° Fahrenheit. Here snow is almost unknown, and verdure is rarely checked, unless during the occasional droughts of summer. On the central plateau matters are quite reversed; the summer's heat is excessive, and the winter's cold, rendered keener by stormy blasts from the mountains, is equally so. In this region the winter is long, and snow covers the sierras; while the summer is short, and so hot, that verdure is often destroyed. On the northern and western sea-board the summer becomes cooler; and the winds, charged with moisture from the Atlantic, bring rains and other atmospheric diversities.

The vegetation of a country so diversified in surface and climate must necessarily present great variety, and thus we find within its limits the banana and palm of the tropics, and the pine of the polar regions. Though a number of the more useful plants in the peninsula be indigenous, yet a great many are naturalised exotics, imported during the early and better days of its commerce and naval adventure. The chief of these, without reference to locality or culture, are—wheat, oats, barley, maize, rice, hemp, flax; the vine, olive, sugar-cane, cotton, lemon, citron, fig, pomegranate, date, almond, pistachio, banana, and plantain; the apple, pear, peach, cherry, walnut, chestnut, and hazel; and to these we may add the dwarf-palm, mulberry, carob, caper, red pepper, saffron, and aloe. With respect to forest-trees there is much less variety; the peninsula being one of the worst wooded regions in Europe. The principal trees are—the evergreen, cork, cochineal, and other varieties of oak; the beech, poplar, sumach, tamarisk, chestnut; and in the sierras and higher grounds, the fir and pine. The animal kingdom pre-

ated on the Spanish side of the strait, belong to Britain. The promontory consists of a vast rock, rising from 1900 to 1400 feet above the sea; is about 3 miles in length, and from  $\frac{1}{2}$  to  $\frac{3}{4}$  of a mile in width; and is joined to the mainland by a low sandy isthmus about  $\frac{1}{2}$  miles in length. On the north side, fronting the isthmus, the rock is almost perpendicular; the east and south sides are also steep and rugged; but on the west side it slopes downward to a fine bay 9 miles long by  $\frac{1}{2}$  broad. On this slope lies the town, containing a mixed population of 16,000; and above rise the principal ramparts of the rocky fortress, which is generally garrisoned by upwards of 3000 troops.

sents only one or two features worthy of notice. The principal wild animals are—the bear, wolf, fox, herds of wild-boar, lynx, wild-cat, and monkey; the vulture, quail, bustard, flamingo, and some African forms, are peculiar to the birds; reptiles of the serpent family are more numerous than in any other part of Europe; and of insects economically important, may be mentioned the bee, silk-worm, gall-nut fly, and cantharides. The distinguishing features in the domesticated animals are—the horse, of Arab extraction; mules, the finest in the world; and the merino-sheep.

The inhabitants of the peninsula—Spaniards and Portuguese being originally one—are usually arranged into four races:—1. The Spaniards, an admixture of Teutonic and Roman blood, who constitute the great bulk of the people, and whose language is a compound of Visigothic and Latin; 2. The Basques, of Navarre and the Basque provinces; 3. The Moors, or Moors, who are found chiefly in the south; and 4. The Gitanos, or Gipsies, spread indiscriminately over the country, but preserving intact the individuality and peculiarities of their race.

The religion of both countries is Roman Catholic; and until some recent reformatations, which have yet taken little effect, was of the most degraded and degrading character. 'The peninsula,' says a recent writer, 'swarms with an idle, ignorant, and intermeddling priesthood; and though their power be now greatly shorn by the abolition of their regular establishments, yet their influence both over the government and the people is immense; and, to their shame be it added, that that influence is chiefly exercised in retarding the social progress of the people.' In Spain, the education of the people is entirely under the power of the clergy. There are, properly speaking, no elementary establishments; for although several schools, academies, and colleges have been endowed, the unsettled state of the country has prevented these from taking the effect. Portugal, on the other hand, can boast of a number of seminaries, some of which are nominally of a higher class; but how they answer the end intended, may be gathered from the fact, that the pupils are only about 1 in 90 of the entire population.

The industrial pursuits of the two kingdoms composing the peninsula are much of the same kind and character. Both are more agricultural than manufacturing or commercial countries; comprehending under the former term all that appertains to grain, fruits, herds, and other produce depending upon the soil. Anything like a systematic agriculture, however, is altogether out of the question; nor need much improvement be looked for so long as both states remain in their present distracted condition, and so long as the present mode of tenure exists. In mining, matters are not quite so bad; and of late, considerable activity has been exhibited, principally, however, through the agency of foreign companies, in the quicksilver, lead, and iron departments. In the arts and manufactures, neither country exhibits much skill or activity; silks of average quality, coarse woollens, cottons and linens, paper, leather, plate and jewellery, soap and barilla, comprising all that are of any importance. As to their commerce, whatever it may have been in the fourteenth and fifteenth centuries, it is now of little importance, a great portion of the foreign trade of the peninsula being conducted by the merchants and ships of other nations. The chief exports of Spain are—wine, quicksilver, lead, wool, raisins, figs, oranges, lemons, and other fruits; olive-oil, barilla, cork-bark, honey, and occasionally some wheat—valued annually at £4,500,000: those of Portugal are wine, oranges, lemons, figs, and other fruits; cork-bark, olive-oil, sumach, wool, goats' skins, and small quantities of tallow, brandy, and other articles, valued at £2,000,000. The imports amount nearly to the same sum.

The government of Portugal is a limited hereditary monarchy, with the succession unrestricted to sex. By the charter of 1826, the legislative power is vested in the sovereign and the cortes, who are divided into two

## EUROPE.

chambers—the Chamber of Peers, named by the sovereign, who are unlimited in number, and whose dignity is hereditary or for life; and the Chamber of Deputies, elected for periods of four years by provincial electors, who are themselves named by the primary assemblies of parishes. More than this cannot be said of the government of a country which is incessantly torn asunder by contending factions, and where a new system of administration is set up to-day only to be overturned to-morrow. Total population, 3,549,994; annual revenue, £2,550,000; debt, £19,838,000; army, 18,000. The capital city is Lisbon on the Tagus, with a population of 260,000.

The government of Spain is also a limited hereditary monarchy, with the succession unrestricted to sex. The legislative power is vested in the sovereign and cortes, or national assembly, which is divided into two chambers—the Senate, composed of the prelates, hereditary grandees, and certain others, nominated by the sovereign for life; and the Congress of Deputies, composed of citizens elected for three years by the juntas of provinces, the members of which are elected by the municipal bodies, or ayuntamientos. Such, we believe, is the present constitution; but no less than four constitutions have been in operation during the present century, and matters yet remain in a very unsettled condition. The total population of the country is estimated at 12,387,000; annual revenue, £11,700,000; debt, £286,300,000, of which only £89,600,000 is acknowledged; army, 69,000. The capital city is Madrid, with a population of 210,000.

### SWITZERLAND.

Situated between lat. 45° 50' and 47° 45' north, and long. 5° 55' and 10° 30' east, Switzerland occupies the very centre of the Alpine development, and is consequently the most elevated and irregular of European countries. It is bounded on the north by Germany; on the east by Austria; on the south by Italy; and on the west by France. Its superficies is estimated at 14,950 square miles, of which a large proportion is covered with lakes and glaciers.

The superficial character of the country is sufficiently indicated by the mention of its position—a region composed of mountain-ridges, radiating in every direction, with narrow and tortuous river-valleys between. The higher mountain-ridges range from 6000 to 15,700 feet above the sea; their summits from 9600 feet and upwards, buried in perpetual snow and glaciers, and their sides broken into every imaginable diversity of crag, cliff, ravine, and waterfall, dotted at intervals with clumps of pine and fir. The valleys, on the other hand, though still from 1200 to 1500 feet above sea-level, are distinguished alike for fertility and beauty, and form a singular contrast with the rugged heights which frown above them. The tract lying between the Alps and Jura mountains, and in which all the great lakes from Constance to Geneva are situated, may be regarded as the Lowlands of Switzerland; and yet the general altitude of this plateau is from 1600 to 2000 feet, at the same time that it is intersected by numerous ridges and river courses.

The rock formations in the higher and central districts are strictly primary, flanked by transition and the older secondaries. The equivalents of our own lias and chalks are also found at great heights overlying the older rocks, thus marking the date of the Alpine and Jura elevation; and in the low tract above described occur alternations of soft greenish sandstones and limestones, the supposed equivalents of the Paris tertiary. The mineral products are chiefly confined to roofing-slate, marble, gypsum, granite and other building stones, and a few iron and asphalt mines in the Jura. Traces of coal have been met with; salt springs occur in Basle; and springs of some medicinal celebrity in Berne, Vaud, Glarus, and St Gall.

Several of the great European rivers—the Rhine, Rhone, Inn, Tesino, and Doubs—have their sources amid the glaciers of Switzerland, which thus enjoys

them merely as rapid mountain-streams, unavailable as channels of communication. The Aar is the only river of any navigable importance, having its course exclusively within the territory of the Confederation. The lakes of Switzerland, either as regards their extent or the beauty and magnificence of their scenery, are unexcelled by any in the world. The principal are—Constance or the Boden See, Geneva or Leman, Neufchatel, Zurich, Lucerne, the Unter See, Wallenstadt, Zug, Thun, and Brienz, on this side the Alps; and portions of Maggiore, Lugano, &c. which lie on the other side of the Alps, chiefly within the confines of Italy. The four first are the most important as well as the largest, and are traversed by small steamers in addition to the usual sailing boats of the country.

With respect to climate, Switzerland is said to be much colder than its latitude or its position in Europe would appear to warrant. The mean annual temperature at Berne is 45° Fahrenheit; at Basle 46°; and at Geneva (1200 feet above the sea) 46½°. Of course altitude is the prime cause of this deficiency, though it is no doubt considerably increased by the cooling effects of the glaciers and snow-clad summits, the openings and exposures of the valleys, and other analogous causes. The plants of nearly all the different zones of Europe are thus found in Switzerland, from the vine, olive, and mulberry of the sunny valley, up to the herbaceous willow, the lichens, and mosses that struggle up to the confines of eternal snow.

The inhabitants are usually ranked under two races—the Germanic and the Græco-Latin: the former comprising the Deutsch or German Swiss of the northern and central cantons; the latter the French and Italian Swiss of the western and southern parts. The great majority of the population—say 1,600,000—are German, speaking the Deutsch language, which is indeed the language of the Confederation; the French are estimated at 450,000; the Italian at 121,000; the Romance, speaking a dialect of the Latin, 51,000; and the Jews 2000. According to the most recent authorities, the entire population is 2,372,920.

With respect to the religion of the Confederation, accounts are somewhat contradictory, but it is generally admitted that the Protestants number about 1,286,000; the Roman Catholics, 847,000; Jews, 2000; other persuasions making up the remainder. In some of the cantons the Roman Catholic faith is the only religion tolerated; in some Protestantism (chiefly Calvinistic) is equally exclusive; while in others there is no restriction whatever. Educational affairs seem to be better ordered; and most writers agree in regarding Switzerland, on the whole, as one of the best-educated countries in Europe—the proportion of pupils at school being as 1 to 9 of the population. The instruction of children from five to eight or ten years of age is compulsory; and for this purpose every district has an elementary school, independent of a secondary one for classical and scientific tuition. Besides these, there are normal schools for the training of teachers in several cantons; academies in the chief towns; the four universities of Basle, Zurich, Berne, and Geneva; certain public libraries, literary associations, and institutions for instruction in the arts.

The productive industry of the country is astonishing, considering its size and natural capabilities. Owing to its mountainous character, it is more pastoral than agricultural, and yet a considerable area is under tillage, yielding excellent crops of oats, barley, and rye. Wheat can scarcely be ranked as an object of culture; but maize, beans, lentils, potatoes, turnip, hemp, and flax are raised to some extent. It is in the management of the dairy that the Swiss chiefly excel—cattle, cheese, and butter being articles of export; and to this end the irrigation of meadow-land is perhaps better conducted than in any other part of Europe. The vine is cultivated in the valleys; and in some districts large orchards of apples, pears, and cherries, for the manufacture of liqueurs. In several of the arts and manufactures the Swiss exhibit great ingenuity and taste; but

most of these are conducted more in the cottages of the peasant landholder and shepherd than in independent factories. The branches which are most attended to will be best exhibited by an enumeration of their principal exports—namely, silks, cottons, lace, gloves, watches, jewellery, musical instruments, straw-plait, woaden vessels, cheese, butter, wine, and liqueurs.

As regards government, the twenty-two cantons into which the country is divided are united on equal terms in a confederation for mutual defence. The grand federal council or General Diet of Switzerland is composed of deputies from all the cantons, each sending two or three deputies, but exercising only one vote. This diet meets once a year, and sits every two years alternately in Berne, Zurich, and Lucerne. Its function is to treat with foreign powers, declare war, conclude peace, determine the amount of military force, regulate the finances of the Confederation, and other matters of common interest. Besides its statutory meeting, the diet can be assembled at any time on the request of five cantons; and when not sitting, its powers are so far delegated to the grand council of the directorial canton for the time being. In all judicial, ecclesiastical, and fiscal matters, each canton acts for itself as a free and independent republic, with the exception of Neuchâtel, in which the king of Prussia exercises the right of sovereign. There is, strictly speaking, no standing army; but each canton has its militia, liable to be called out either for its own or the general service—the whole amounting to a force of 64,000 men. The federal expenses for administration, army, &c. amount to £30,000 annually, and are defrayed by the interest of certain capitals set aside for the purpose.

#### ITALY.

This is now merely a physical, not a political territory, its surface being partitioned into a number of perfectly distinct and independent states. It is partly peninsular and partly insular, lying chiefly between lat. 36° 35' and 46° 40' north, and long. 6° 40' and 19° east. It is bounded on the north by Switzerland and Austria, from which it is naturally separated by the Alps; on the east by the Gulf of Venice; on the south by the Mediterranean; and on the west by the Mediterranean and France. Its area, including that of the islands, is computed at 122,800 square miles. The largest and most important of these islands are—Sicily and the Lipari group, belonging to Naples; Sardinia, to the kingdom of the same name; Corsica, forming one of the departments of France; Elba, attached to Tuscany; and Malta, possessed by Great Britain.

*Superficially*, Italy exhibits much diversity and beauty. Guarded by the Alps, its northern fringe exhibits all the features of the Swiss landscape; but this soon changes into scenery of the most opposite description—namely, the great plain of Lombardy, which extends along the base of these mountains for more than 260 miles, with an average breadth of 50, is flat and low, but fertile and well cultivated, and watered throughout by the Po and its numerous affluents. The only other mountain development is that of the Apennines, which, branching from the Maritime Alps in Genoa, range southward like a backbone or spine through the centre of the peninsula, bifurcating at Venosa into two minor ridges—the one forming the heel, the other the fore-foot of the fanciful boot. From the Apennines, which attain an extreme height of 9520 feet, the country slopes on both sides, intersected by streams and valleys, and terminating near the coast in flatish land—the largest extent of which is the 'Maremme,' lying between the Arno and Gulf of Gaeta, of variable breadth, but about 220 miles in length.

The principal rivers of the country, which, on the whole, may be regarded as well-watered, are—the Po, with its numerous Alpine tributaries, flowing through the great plain of Piedmont and Lombardy, and falling by several mouths into the Gulf of Venice—subject to destructive inundations, and, considering its volume and sluggish current, of no great use to navigation;

the Adige, also flowing into the Gulf of Venice; the Tiber, with its small affluents, rising in the Apennines, and falling into the Mediterranean, navigable to Rome; and the Arno in Tuscany, navigable to Florence, and connecting with the Chiana, one of the tributaries of the Tiber, by means of a canal.

*Geologically*, Italy presents considerable difficulties, partly in consequence of the disturbance to which the formations have been subjected, and partly owing to the dubious character of some of the calcareous strata. Granite, primary schists, and limestones, occur in the Alps, in the northern extremity of the Apennines, and in their southern bifurcations. The great central range of the Apennines is said to consist chiefly of Jurassic limestones, occasionally broken through by older strata, flanked on the north by secondary rocks, and on the south, downwards to the Mediterranean, by recent tertiary, replete with marine remains. Through these tertiary sandstones and marly limestones rise numerous volcanic hills, but lately extinct, or still in operation. This chain of volcanic action may be said to fringe the whole of the Mediterranean sea-board, from the Arno to Sicily—exhibiting numerous dormant craters, and the still active ones of Vesuvius (3200 feet), the Lipari Isles, Mount *Ætna* (10,870 feet), besides being accompanied by frequent earthquakes and subterranean convulsions. The principal mineral products of the country are—iron from Elba; the finest statuary marble from Carrara in Modena; sulphur from Sicily; alum and nitre from near Rome; alabaster from Tuscany; and in minor quantities copper, lead, ore, borax, salt, puzzolana, pumice, and bitumen.

The *climate* of Italy has been greatly extolled; but this is true only of certain localities, and under certain seasons. The temperature may be generally mild, the atmosphere of unexampled transparency, and the sky unclouded; but certain tracks, as the plain of Lombardy, Campagna di Roma, the Pontine Marshes, the Campagna of Naples, &c. are subject to the fatal scourge of the *malaria*, while the southern shores are occasionally visited by the pestilential and enervating sirocco and simoom. As respects temperature, it is usual to divide the country into four regions:—1. North of the Apennines, or the 44th parallel, where frosts are experienced in winter, and where the orange and lemon do not flourish in the open air; 2. The central regions, including Tuscany and the Papal States, where the vine, olive, orange, lemon, &c. flourish without culture, and where snow is only known on the mountain heights; 3. The middle districts of the Neapolitan territory, where snow is rarely seen on the Apennines, and where the finest fruits are found in the valleys throughout the winter; and 4. The southern provinces of Naples and Sicily, where the thermometer never falls to the freezing-point, and the sugar-cane, opuntia, and other tropical plants, luxuriate in the low lands.

The *vegetable* productions of northern Italy differ little from those of southern France, and the valleys of Switzerland, already described; the cultivation of rice, and the more extensive growth of the mulberry, being perhaps the main peculiarities. In southern Italy, the products, as indicated in the preceding paragraph, are more analogous to those of the south of Spain—receiving greater diversity from the successive stages of the Apennines, which are clothed in many places with forest growth to the very summit. Of *animals*, we may mention the wolf, wild boar, stag, fox, lynx, badger, marmot, crested porcupine; the quail, bustard, ortolan, and a variety of game; a number of snakes and reptiles; the tunny, mullet, anchovy sardel, and other fishes; the silk-worm, and the celebrated tarantula spider.

The *inhabitants* are described as 'a mixture of races, composed of Greeks, Gauls, Germans, Goths, Arabians, and many others, who have migrated into the peninsula at various times, and intermingled with the original population, whose language they have superseded. They have long been divided into numerous tribes and nations, with separate political and social interests,

and speaking dialects so different, that the inhabitants of one province can scarcely, if at all, understand the language of another.' What we denominate *Italians* is, however, the written language, used by the several governments, and spoken as a vernacular by all the educated classes. The basis of this is the ancient Latin, modified by the infusion of foreign elements.

The *Roman Catholic religion* is that professed in all the states, and by almost the whole population; the only exceptions being the Protestant Waldenses in Piedmont, the Greeks in the principal commercial towns; and the Jews, who are found chiefly in Rome, Leghorn, and Venice. Being the head and centre of the Papal power, it might be anticipated that the number of those officially connected with the church in Italy should be very great, though one would hardly expect that they were as 1 to 50 of the population—the proportion usually given by statisticians. *Educationally*, the country is one of the most neglected in Europe—the proportion of pupils to the entire population being as 1 to 50 in the Papal states; 1 to 53 in Lucca; 1 to 66 in Tuscany; and as 1 to 70 or more in the Neapolitan territory. The only state that enjoys anything like an elementary system is Lombardy, now under the Austrian empire; and there the proportion is said to be as 1 to 13.

The *productive industry* of Italy presents considerable variety, but is by no means so important as the natural capabilities of the country appear to warrant. Lombardy is the chief corn-growing state, and there *agriculture* and irrigation are conducted upon something like correct principles; in Genoa and Tuscany the culture of fruit is more attended to; the central parts are mainly pastoral; and in Naples and Sicily 'the abundance of vegetable productions is more owing to the climate and soil than to the industry of the husbandman.' The culture of silk, the vine, and olive, are three important branches, and in these the people exhibit considerable skill and industry. As in all Catholic countries, fish forms an important item of consumption; and consequently the tunny, anchovy, mullet, and other *fisheries*, are conducted upon an extensive scale. 'Italy is not distinguished,' says Macculloch, 'for manufactures; the chief are those of silk fabrics, silk thread, &c. which have their principal seat in Lombardy. Woollen and linen stuffs, straw-plait, gauze, artificial flowers, straw-hats, paper, parchment, leather, porcelain, gloves, essences, and musical instruments, are among the other goods manufactured; but, generally speaking, the raw products of the country form its chief exports, and most manufactured articles, whether of necessity or luxury, are imported from foreign nations.'

*Politically*, Italy is divided into a number of independent states, each having its own peculiar government, and all less or more of a despotic character. At present there are nine of these states; but on the demise of the Duchess of Parma, the Duke of Lucca succeeds to her estates, and Lucca is to be annexed to Tuscany. We may shortly enumerate—1. The kingdom of Sardinia, comprising the island of that name, the principalities of Piedmont and Nice, and the duchies of Genoa and Savoy. Monarchy absolute and hereditary; supported by a military force of 40,000 men, and a small navy. 2. Venetian Lombardy, which includes the ancient republic of Venice and the duchy of Mantua. This province now forms an integral part of Austria, and is under the administration of a viceroy, appointed by the emperor, by whose troops it is garrisoned. 3. The duchy of Parma, the government of which is also absolute, but paternal in spirit. 4. Modena, including the small duchies of Modena, Reggio, Mirandola, and Massa-Carrara. 5. Lucca, a small maritime duchy, occupying a corner of Tuscany, to which it is to be eventually attached. 6. Tuscany (anciently Etruria), a grand-duchy, consisting of one large unbroken territory, a detached portion on the confines of Parma, and the isles of Elba and Giglio; after Lombardy, the most industrious and well-conducted of the Italian states.

7. States of the Church, all lying contiguous, with the exception of St Benevento and Ponte Corvo, in the Neapolitan territory; ruled by the pope, as a secular prince; and as this prelate is elected from the college of cardinals, the government may be described as an elective monarchy. 8. San Marino, a small republic, forming an enclave of the Church States, and under the protection of the pope. 9. The kingdom of Naples—or, as it is sometimes called, The Kingdom of the Two Sicilies—comprehending the southern region of the peninsula, the large island of Sicily, and the Lipari Isles. The government is an absolute hereditary monarchy, supported by a force of 30,000 men, and a considerable navy.

## TURKEY IN EUROPE.

The Turkish or Ottoman empire embraces a series of territories, situated partly in Europe, partly in Asia, and, if we consider its nominal connection with Egypt, partly also in Africa. A vast extent of the country thus indicated is, however, virtually independent: Egypt may be said to be wholly so; the Danubian regions of Moldavia, Wallachia, and Servia, are but slenderly related, and many of the tribes in Asiatic Turkey bear as little allegiance to the sultan as they do to the sovereign of Britain. It is to that portion of the empire generally delineated by geographers as 'Turkey in Europe' that we now confine our description. Lying between lat. 39° and 48° north, and long. 16° and 29° east, this territory is bounded on the north by Austria and Russia; east by the Black Sea, Sea of Marmora, and the Archipelago; south by Greece; and west by the Ionian and Adriatic Seas. The area thus enclosed is estimated at 180,200 square miles, exclusive of a few isles in the upper part of the Archipelago, and of the island of Candia in the Mediterranean.

Respecting the *physical aspect and construction* of the country little is known with accuracy—less, perhaps, than of any other section of Europe. The mountains which give diversity to the southern provinces are the Dinaric, Balkan, Candavian, Rhodope, and other ramifications of the Alpine system; the Eastern Carpathians form the only ridge in the north, and that merely as a boundary with Austria, in which they have their chief development. South of the Balkan range the surface presents considerable diversity—hill and glen, slope and well-watered valley; none of the latter being entitled to the character of *plain*, except those in Macedonia, Thrace, and Thessaly, which have been long celebrated for their beauty and fertility. The northern provinces, on the other hand, present extensive level tracts, inferior to none in Europe in point of size, and generally of the richest alluvium, unless where they degenerate into marshes skirting the Danube, as in Wallachia and Bulgaria. The *minerals* of economical importance are marble; iron, copper, lead, and silver ore; magnesia, meerschaum, and whetstones; but mining, unless in Bosnia, is little attended to.

As to *climate*, Turkey is generally said to be 'colder than the other countries of Europe lying within the same parallels.' In the flat provinces of the north the summer is hot and sultry; the winter, on the other hand, is severe, and snow lies for fully five months on the mountains. South of the Balkan, whose heights are annually covered with snow, the seasons are less marked; and though the weather is somewhat changeable, the climate of the valleys is delightful. In Croatia, Bosnia, and the adjoining provinces, the cereals and other cultivated crops can be raised in any quantities on the plains, while the mountain-slopes are clad with forests of oak, elm, and pine. South of the Balkan the country is covered with forests of the sycamore, plane, carob, box, and cypress; gardens of roses, jasmine, and lilac; vineyards and orchards of nearly all kinds of fruit-trees; but it is destitute of the olive, which, except in some favourable localities, does not thrive north of lat. 40°. The Flora of Albania is similar to that of the opposite coast of Italy: in Thessaly—the garden of European Turkey—the olive, vine, fig, pome-

granate, walnut, almond, orange, lemon, citron, cotton, tobacco, silk, &c. are reared in perfection; while blooming wildly are the hyacinth, narcissus, tulip, and other nurslings of our gardens. The principal wild animals are—the bear, wild-boar, wolf, jackal, fox, &c.; abundance of deer and game; a plentiful supply of fish, among which the sturgeon is peculiar; and the silk-worm, first reared in Europe at Constantinople about the middle of the sixth century.

The ruling people of the country are the Ottoman Turks, an offshoot from the Toorkee or Tartars of Central Asia, who, in the year 1453, conquered that part of the country lying within the confines of Europe. Intermixture with other races, and the physical conditions of place, have stamped them, however, with peculiarities not to be found in the existing Asiatic Mongols. The other inhabitants—more numerous in several provinces than the Turks—are the Greeks in Thessaly and Rumili; the Albanians in the west; the Croats, Bosnians, Servians, and other Slavonians; the Wallachians and Armenians; Jews, Gipsies, and Franks. The Turks, and many of the Albanians, Bulgarians, and Bosnians, are Mohammedans or observers of the Koran ritual; the Greeks, Servians, and some of the Bosnians, belong to the Greek Church; the Jews adhere to their own ancient belief; while many in all of the provinces are Roman Catholics, or of no faith at all. 'In Turkey,' says a high authority, 'the great number of employments for which learning is necessary acts as a stimulus to the desire for education, and there is accordingly no want of schools, where the elements of knowledge—as spelling, reading, and the principles of grammar and religion—are taught. To all the imperial mosques are attached madresses or colleges, where aspirants to legal or sacerdotal offices are instructed.' The reader must not be misled, however, by this statement: there are thousands in every province who never saw the form of a letter; nor can we, with our ideas of instruction, regard that as a liberal education which is restricted to the reading of the Koran and its commentaries, to the code of civil law, or to the studies of astrology and medicine as expounded by the Arabic writers of the ninth century!

Every branch of industry, says the 'Cyclopædia of Commerce,' is in a backward state in Turkey. Although there is a general recognition of the principles of free trade, yet in most parts power makes law, and there is no real security of property. The cultivators are congregated in villages, and agriculture is in a very rude condition; still, so great is the fertility, that there is a surplus of corn for exportation. The grains chiefly cultivated are—maize, wheat, rye, barley, oats, and buckwheat; the vine is grown in most of the provinces; and flax, hemp, saffron, cotton, tobacco, madder, &c. chiefly in the south. Manufactures appear formerly to have attained greater excellence than was to be expected; but of late years they have been depressed by foreign competition, and the domestic weaving of cotton stuff for family use, and some silks at Constantinople and Salonica, are now almost the only branches of consequence. In hardwares, the braziers and iron smiths of Shumla have acquired some celebrity; steel is manufactured at Bosna-Serai, and firearms at Semendria, Gabrova, and other places. Commerce is impeded by the want of roads; and almost all merchandise is conveyed throughout the country on horseback.

The government is an absolute monarchy or despotism, hereditary in the family of Osman, but restricted to males. The sultan, as caliph, or successor of the prophet Mohammed, unites the highest spiritual dignity with the supreme secular power. He has unlimited control over the property and lives of his subjects, from the meanest menial to the highest officer of state, whom he can remove or put to death at will. The only limit to his will is the Koran, or Book of Mohammed (see No. 76), which he is bound by his oath of office to observe; and this is in reality the source of all civil, political, or criminal law. In addition to the code of laws, the interpretations of the ulema, or priest-

hood, have great weight in the tribunal. The mufti is not only the chief of the priests, but the highest interpreter of the laws; and his decisions are collected and respected as precedents. For administrative purposes, the provinces and principalities are arranged into *eyalets*, and these again into *livas* or *sandjaks*, superintended by viziers, pachas, beys, and other officials. Population, 12,200,000; revenue, £2,550,000; debt, £7,600,000; army, 124,000. Capital, Constantinople, with 500,000 inhabitants.

GREECE.

This country, whose ancient history is so intimately associated with all that is refined and ennobling in human progress, occupies the south-east extremity of Europe, commonly distinguished as the Hellenic Peninsula. It is surrounded by the Mediterranean, except on the north, where it is bounded by Turkey, of which, till 1821, it formed one of the component sections. Its area is estimated at 15,000 square miles, of which not more than two-fifths are susceptible of cultivation.

The physical aspect of the country is decidedly mountainous and rugged; its hills, though seldom rising above 5500 feet (Liakoura in the Parnassus is 8068 feet, and St Elias in the Morea 7900 feet), being so abrupt and craggy as to assume an appearance more majestic and imposing than many others of double the altitude. Rising and radiating in every direction, the hills occupy fully three-fifths of the surface, leaving the remainder in narrow defiles, glens, and basin-shaped valleys, which respectively formed the sites of the numerous petty states into which ancient Greece was divided. The mineral products are—marble of various colours, porphyry, slate, coal, gypsum, sulphur, alum, asphalt, zinc, lead, iron, gold, silver, copper, manganese, and cobalt; none of which, however, are obtained in important quantities.

Considerable diversity of climate is experienced, in consequence of the varied altitude of the country, and the manner in which it is intersected by bays, gulfs, hills, and valleys. No portion reaches the snow-line, but snow annually falls on the higher hills, where it often lies for weeks together. Winter may be said to be confined to December and January; spring and autumn are marked by heavy rains, usually accompanied by tempests and thunder-storms; but throughout the whole summer, of full six months' duration, a cloud is seldom to be seen; and though the temperature often exceeds 100° Fahrenheit, yet the tempering influence of the sea-breeze prevents the heat from being oppressive. The vegetable and animal products of continental Greece are quite analogous to those of Southern Italy and Turkish Thessaly, already described, with this difference, that the ascending zones of vegetation are narrower, and more decidedly marked, from the vine and olive of the sunny valley to the beech and pine of the mountain.

The dominant people are the Hellenes or Greeks, who chiefly inhabit the eastern and central parts, and who boast of descent from the aboriginal *Graoi* or *Graeci*. Their language is the Romaic, a modernised form of the ancient Greek, to which it bears a much closer resemblance than the Italian does to the Latin. The other inhabitants are Albanians, occupying the greater part of Livadia and the western part of the Morea; and Mainotes, in the south of the peninsula, who boast of descent from the ancient Spartans. The established or national religion is that of the 'Orthodox Oriental Apostolic,' or Greek Church, having the sovereign for its head, and governed by a holy synod, consisting of seven members annually elected by the dignitaries from their own number. The only other ritual observed to any extent is that of the Roman Catholic, and this more especially in the islands. Educationally, Greece promises well, though at present not one-eighth of the children receive any instruction whatever. By an edict which is gradually taking effect, a number of elementary schools and higher gymnasia are to be established and maintained out of the revenue of the former me-

nasteries—and of these seminaries upwards of forty are now in operation.

The *productive industry* of the country differs little from that of the southern parts of Turkey, already described. Agriculture is in a very primitive condition; but the fine soil of the valleys enables the inhabitants to reap excellent cereal crops, which are ripe about the end of June. The vine and currant-grape are extensively cultivated; the other fruits are more the gift of nature than the results of culture. The manufactures are mostly domestic, and quite inconsiderable; fishing is largely carried on; and the extent of their commercial intercourse with the neighbouring countries of the Levant is said to employ 4500 vessels, navigated by upwards of 16,000 men.

The *government* is a constitutional, though nearly a despotic, monarchy. Greece formed a part of the Turkish empire till 1821, when the people revolted, and after a long and severe struggle, succeeded with the aid of England, France, and Russia, in achieving their independence. The country was accordingly formed into the new kingdom of Hellenes, and Otho, a prince of Bavaria, appointed king. The Council of State is composed of three vice-presidents, seventeen councillors in ordinary, and fourteen special councillors. Subsequently, Athens was declared the capital, and the country divided, for administrative purposes, into twenty-four *nomoi* or governments, and seven sub-governments. National debt about £4,286,000; revenue, £527,000; expenditure, £600,000. Army, 3800; navy, 32 vessels, of all sizes, manned by 2000 hands.

#### Ionian Islands.

The *Ionian Islands*, situated on the west and south coasts, were formed in 1815 into an independent republic or oligarchy, under the protection of Britain, by whose troops they are garrisoned. The principal islands are Corfu (which, as the key to the Adriatic, has always been of considerable political importance), Cephalonia, Zante, Santa Maura, Thiaki or Ithaca, Cerigo, and Paxos, containing an area of 1041 square miles, with a population of 223,000. The government is vested in a high commissioner, residing at Corfu, who represents the British sovereign; a legislative assembly of twenty-nine members, elected partly by the nobles and partly by the commissioner; and a senate of five members, elected by the legislative assembly, with a president appointed by the commissioner. The army, the police, and the *sanità*, or health establishment, are under the sole direction of the high commissioner. These islands exhibit in miniature, both physically and industrially, the chief features of the mainland.

#### AUSTRIA.

The Austrian empire occupies a large portion of central Europe, and consists of an aggregation of kingdoms, principalities, and duchies, acquired at various times by treaty or by conquest. To the archduchy of Austria, the nucleus of the whole, there have been added since the end of the thirteenth century the kingdom of Bohemia, Moravia, part of Silesia, Styria, Illyria, Tyrol, Auschwatz, and Zator in Galicia—all belonging to the Germanic confederation; Galicia, one of the partitions of Poland; Buckowina, formerly part of Moldavia; the kingdom of Hungary (including Croatia, Sclavonia, and the Military Frontier); the principality of Transylvania, which had been connected with Hungary for many centuries; and lastly, Venetian Lombardy, attached so recently as 1815. This vast territory, though thus composed of a heterogeneous assemblage of tribes and nations, lies compactly together, and is situated between lat. 42° and 51° north, and long. 8° 30' and 26° 30' east. Its area is estimated at 257,368 square miles, of which 75,822 are occupied by the provinces included under the German confederacy; aggregate population, 35,804,152.

The *natural features* of the empire, exclusive of Lombardy, already described under Italy, exhibit wide and well-marked diversity of hill and plain. The mountain-ranges are bold and continuous; the plains are amongst the most extensive in Europe. Of the former, the principal are—the Alpine development of the

Tyrol, which, under the title of the Carnic, Julian, and other ridges, diverge into Illyria and Styria; the eastern and western Carpathians, which encircle the whole of Hungary and Transylvania north of the Danube, ramifying into the minor chains of the Jablunka, Little Carpathians, &c.; and lastly, the Riesen-gebirge, Erzgebirge, and Böhmerwald ranges, which, enclosing Bohemia, form the boundary with Saxony and Bavaria. In the western or Germanic provinces of the empire there are a number of fine valleys, watered by such rivers as the Inn, Enns, Moldau, March, Muhr, and Drave; while in Galicia and Hungary expand some of those vast plains which give character to this region of Europe. The most remarkable of these is that of Middle Hungary, traversed by the Danube, the Theiss, Drave, and Maros, and said to comprise an area of 35,000 square miles.

The country abounds in *minerals*; but its capabilities are far from being developed. Gold and silver are mined in Hungary and Transylvania; quicksilver at Idria in Carniola; the supply of iron is immense; lead and copper are abundant; tin, calamine, zinc, cobalt, antimony, bismuth, manganese, and almost every other metal, can be procured. There are also abundant supplies of rock-salt, as at Wieliczka; marble, coal, alum, saltpetre, and sulphur; clay for the finest porcelain; quartz for glass; and most of the precious stones. Connected with its geology, we may notice the *mineral and thermal springs*, of which nearly a hundred are annually frequented by visitors from all countries.

In point of *climate*, the country is generally divided into three regions. 1. The southern, extending from lat. 42° to 46° north, where the depth of winter resembles the month of March in northern countries, and where are found the vine, fig-tree, olive, and myrtle. 2. The middle region, from lat. 46° to 49° north, where the olive is not found, but where maize and vines thrive in favourable situations. Here winter lasts from three to four months; summer is warm, but variable; and the air is salubrious, except in the vicinity of the Hungarian marshes. 3. The northern zone, extending from lat. 49° to 51° north, where winter is severe, and lasts fully five months; where vines and maize are no longer met with, and where wheat requires a favourable situation. Under these various climatic influences, and with a generally fertile soil, Austria possesses most of the cultivated grains and fruits; while in her extensive forests flourish all the timber-trees known in England. Among the wild animals may be noticed the brown bear, wolf, lynx, roe, red and fallow-deer, the ibex, elk, urus; wild boar, and herds of rather diminutive horses, which range uncontrolled in the plains of Hungary; a variety of game birds, the golden and other eagles, herons in vast flocks; the land tortoise; leeches, which supply the greater part of Europe; the blistering fly; and the bee, whose wax and honey yield a large annual revenue; with the silkworm in Venetian Lombardy and the lower district of the Tyrol.

The *population*, which consists of several distinct races, is arranged by the best authorities in the following proportions:—1. About 18,000,000 are of Slavonic extraction, and are found in Illyria, the eastern parts of Styria, the archduchy of Austria which borders upon Hungary, in some parts of Hungary, Bohemia, Moravia, Transylvania, Dalmatia, and the Military Frontier. 2. The Germans number about 6,300,000, and form an integral part of the population in the archduchy, Styria, Carinthia, the Tyrol, Moravia, and Bohemia; but constitute separate communities in Hungary, Transylvania (where they are denominated Saxons), Galicia, the Military Frontier, and in the Venetian territories. 3. The third race are the Magyars, 6,300,000, who are esteemed of pure Asiatic extraction, and form the majority of the inhabitants of Hungary and Transylvania. 4. The Italians, 4,760,000, constitute nearly the entire population of Venetian Lombardy and the south of the Tyrol. 5. The Wallachians, a medley of ancient Thracians, Romans, and Sclavonians, 1,900,000, chiefly

found in Transylvania, Hungary, and Buckovina. 6. The Jews, 652,000, principally residing in Galicia, Hungary, and Moravia. 7. The Gipsies, Arnauts, Greeks, Armenians, &c. numbering in all about 100,000.

The *dominant religion* of the empire is Roman Catholic; but the Greek United Church and the Armenian Catholic Church have also their dignitaries and establishments. Protestantism is in most parts of the empire only tolerated; though in Hungary and Transylvania the members of that faith enjoy endowments and equal privileges with Catholics. Unitarianism has been long prevalent in Transylvania; the Jews adhere to the Mosaic ritual; and many of the Germans now openly profess a sort of deism or rationalism. In reference to *elementary instruction*, Austria (with the exception perhaps of Hungary and Dalmatia) has recently taken a high position, and is still doing all in her power to maintain it. Every child, from five to thirteen years of age, is compelled to attend school, and there receive general instruction. It is also ordained that no person shall enter the marriage state who is not able to read, write, and cast accounts; that no master of any trade shall, without paying a heavy penalty, employ workmen who are unable to read and write; and that small books of a moral tendency shall be distributed at the lowest price to all subjects of the empire.

*Industrially*, Austria is yet more an agricultural and pastoral than a manufacturing country. It furnishes wheat and other bread-corns in abundance; fruits, wine, hops, hemp, flax, tobacco, saffron, and dye-stuffs; hides, horns, wax, honey, silk, and other animal produce. As already mentioned, silk is largely manufactured in Lombardy; and latterly considerable encouragement has been given to manufactures in cotton and linen in the southern provinces; while Bohemia and Moravia have long been celebrated for their manufactures in woollens, leather, glass, hardware, and firearms. The *mineral* produce has been already adverted to; and, *commercially*, Trieste, Fiume, and Ragusa are rapidly rising into importance. The means of transit for trade and general intercourse have also of late years been greatly extended. Austria now possesses magnificently-constructed roads, leading throughout the chief provinces; has several well-kept canals of considerable length; has five or six long lines of railway; and these in addition to the great navigable rivers, the Maros, Theiss, Drave, and Danube—the last of which has been open to steam-navigation since 1822.

The *government* of Austria is a pure despotism (we speak without reference to the present (1849) unsettled state of the country), under a hereditary emperor and a ministry of his own appointment. Generally, the provinces have each a species of local parliament, consisting of the nobles. In imperial legislation and finance, none of these provincial bodies has any voice, the emperor being the maker of all the laws for his subjects. They meet annually, and their main duty is to receive projects of taxation from the crown, and to allocate the imposition over their respective districts. There are, however, some exceptions to the stringency of despotic power: in Hungary, nothing can be decreed by the sovereign without the concurrence of the Diet, as it is called, or provincial assembly; Transylvania has a separate Diet, but sends members to that of Hungary; and in Tyrol there is a species of representation. The emperor, in virtue of the states already mentioned, is a member of the German Confederacy, in the Diet of which he exercises four votes, and enjoys, besides, the right of presiding. Army about 406,000 men; national debt, £86,310,000; revenue, £15,000,000 sterling. The capital city is Vienna, with a population of 375,884.

## GERMANY.

Germany, as it is called by the English, l'Allemagne by the French, and Deutsch or Teutschland by the natives themselves, is a vast territory, extending from the Baltic Sea on the north to the Gulf of Venice, Italy, and Switzerland on the south; having Prussian

Poland and Hungary on the east, and France, the Netherlands, and German Ocean on the west. This region, occupying an area of 246,000 square miles, is composed of a number of states, independent as regards their interior administration, but by the treaty of Vienna united into one body, called the Germanic Confederation, which, by means of a federative diet, professes to maintain the peace and security of the whole. Under this confederacy are included not only the confused aggregation of small principalities and duchies, but also the greater part of Prussia, the western provinces of Austria, parts of Limburg and Luxemburg in the Netherlands, and Holstein and Lauenburg in Denmark. The following description, however, will be directed more especially to the states forming the region commonly known as Germany, and to the condition of these states previous to the existing (1849) attempts at political consolidation.

With regard to *physical configuration*, the country may be divided into two regions—the northern and southern, separated from each other by the irregular hilly band of the Fichtel Gebirge, Rhon Gebirge, &c. which forms at the same time the great water-shed of the country. The northern region is almost entirely level, including vast tracts of heath and light sandy soil in the north-east, and swamps and marshes in the north-west; while the coast is in some places so low, as to require dikes to defend it from the sea. In this division, the soil, except in Saxony, is in general poor, but not unsusceptible of improvement. The southern portion is more diversified, presenting several long ranges of hills, counterbalanced by the extensive plains of Wirtemberg and Bavaria, from 950 to 1400 feet above the sea-level. Here also the land is superior, and in many districts extremely fertile. In the central hilly band, and westward towards the Rhine, there are many fine river-valleys, verdant, well-wooded, and not devoid of picturesque beauty. Indeed no country in Europe is better watered than Germany, being traversed by several hundred rivers, four of which are of the first class, and about sixty less or more navigable.

The *rock formations* which give character to the country begin with the granitic and primary developments of the Alps and Böhmerwald, and terminate with marine and alluvial deposits of recent origin. Of the metals and minerals sought after and obtained in Germany, we may mention—gold and silver from the Erze (ore) and Hartz mountains, iron, copper, tin, lead, cinnabar, cobalt, bismuth, antimony, and zinc; coal, rock-salt, sulphur, alum, saltpetre, marble, alabaster, gypsum, lithographic slate, roofing-slate, lime, and a variety of building stones; calcedonies, agates, amethysts, and other precious stones.

The *climate* of Germany is said to be 'less variable than the nature of its mountain system, and the ranges of latitude within which it lies, would lead us to imagine; and its vegetation resembles in its general character that of England, or the north of France.' The *vegetable* products of prime economical importance are—the usual bread-corns, maize, buckwheat, pulse, potatoes, turnips, cabbage, hemp, flax, hops, rapeseed, madder, aniseed, mustard, &c.; all the garden fruits in great profusion; and the vine in favourable situations south of lat. 51°, but most successfully on the banks of the 'wide and winding Rhine,' on the Maine, Neckar, Moselle, and Danube. The extensive forest growth, which forms one of the peculiar features of Germany, supplying the inhabitants with fuel and timber, as well as with an article of export, consists principally of oaks, beeches, fir, pines, larches, elms, alders, and birch. Among the domesticated animals, we may particularise the Holstein and Friesland breeds of the horse and ox; the merino sheep of Saxony; and the swine of Bavaria and Westphalia.

The *people* of this portion of the Confederation are mainly of Germanic, Teutsch, or Gothic origin, speaking various dialects of the high and low Dutch; but using, as a written medium, the well-known high Dutch or German language. The other inhabitants are—the

## EUROPE.

French on the Rhine; some Slavonians in the east; and a number of Jews in the principal cities. Catholicism and Lutheran and Calvinistic Protestantism divide among them the great bulk of the people, the chief exceptions being the Jews and Rationalists—the latter having greatly increased within the last ten or fifteen years. 'Educationally,' says a standard authority, 'no part of Europe enjoys advantages equal to Germany, especially the northern part of it. The parochial schools are so general, that none but the wilfully ignorant, or those of imperfect faculties, can be unacquainted with reading, writing, and the first rules of arithmetic. The schools for classical instruction, denominated gymnasiums, pedagogiums, and lycæums, are found in almost every large town, and dispense learning at a very cheap rate. The universities are sufficiently numerous (nineteen within the entire Confederation), and well endowed to provide instruction in the higher branches of knowledge upon terms nearly, if not altogether, gratuitous.

*Industrially*, the Germans are a thrifty, plodding people, and to this spirit are they mainly indebted for the position they have acquired in the arts and manufactures. Their agriculture and husbandry—the produce of which has been already noticed—are of a tidy and domestic character; not conducted, as with us, upon a large scale, but in small 'hofs,' which are profitably and skilfully managed. The products of their *river fisheries* have also been mentioned, as well as that of their *mines*, which have been long conducted upon correct and scientific principles. The principal *manufactures* are those of linen and thread in Silesia, Bohemia, Westphalia; of woollen goods in Saxony, Lower Rhine, Silesia, Brandenburg; of silk, leather, cotton goods, and lace in the Erzgebirge; of tapestry, paper, and glass in Bohemia and Silesia; of mirrors near Nuremberg; of china at Berlin, Meissen, and Vienna; of delf ware in various places; of jewellery at Berlin and Augsburg; of iron wares in Westphalia and the Rhenish countries; of firearms and sword-blades at Spandan, Potsdam, &c.; of cannon at several capitals; of gunpowder, tobacco, artificial flowers, straw-hats, musical and other instruments; of wine, beer, brandy, liqueurs, vitriol; of books, which is one of the most extensive trades in the Confederation; and to these we may add smoked and salted provisions. *Internal communication* is carried on chiefly by the large rivers already mentioned; but partly also by several important canals, and recently by some first-rate lines of railway.

With respect to *government*, it has been already stated that the component states are independent as regards their interior administration, which is generally of an absolute kind; but, by the treaty of Vienna, are united into one body, which, by means of a federative Diet, professes to regulate the common interest. The ordinary business of this Diet is transacted by a permanent minor council or committee, composed of seventeen votes, of which eleven principal states—namely, the Austrian empire, the kingdoms of Prussia, Bavaria, Saxony, Hanover, Wirtemberg, Grand Duchies of Baden, Hessen-Darmstadt, Luxemburg, Electorate of Hessen-Cassel, and Duchy of Holstein—have each one, and the other twenty-seven only six votes; but when weighty affairs are under consideration, the Diet forms itself into a general assembly or *Plenarium*, which contains sixty-nine votes. The members convene at Frankfort-on-the-Maine; and the presidency is vested in Austria. The Confederate army, when assembled, consists of more than 300,000 men, furnished by the respective states in the proportion of 1 soldier for each 100 inhabitants for the active army, and of 1 soldier for each 200 of the inhabitants for the army of reserve.

### HOLLAND.

This is one of the secondary kingdoms of Europe, lying along the south-eastern shores of the German Sea, which, from their uniformly low and level character, are generally known to geographers as the

Netherlands. Its area is estimated at 11,860 square miles, or 13,593, if we include the portions of Limburg and Luxemburg, represented by the king, as grand duke, in the federative Diet of Germany.

*Superficially*, the whole country, saving some slight elevations in Gelderland, Utrecht, and Overysel, forms one unbroken flat, without a hill or rock, without forests, or, except in the south part, running waters; the land consisting mainly of moor, marsh, and meadow-land, traversed by numerous canals, which, while they are absolutely necessary to drain it, and render it fit for cultivation, answer for the most part the purposes of roads—many of them being navigable for large vessels. To describe its surface, however, merely as a low unbroken flat, is not all; in many places its level actually falls from twenty to forty feet below that of the sea, against which it is protected partly, as in Zealand, Friesland, and Gelderland, by enormous dikes, and partly, as between the Helder and the Heek of Holland, by sandhills or *dunes*, cast up by the ocean upon the shores. To preserve these dikes and dunes by artificial facings, and plantings of bent and sea-pine, is one of the chief cares of the government; and yet, in spite of every precaution, large tracts have several times suffered from inundations. The *geology* of the country is thus entirely limited to the most recent marine and river deposits—consisting of clay, sand, mud-silt, and peat-moss—from which the only economical products obtained are—potters' clay, fullers' earth, and peat for fuel.

The *climate*, as might be expected from the situation and lowness of the country, as well as from the number of water-courses which intersect its surface, is generally moist and foggy. In winter, Holland experiences a much lower temperature than the opposite coast of England—the river mouths and canals being covered with ice often for three months together; while in summer, though the nights are generally cold, the day-heat is far above that experienced even in the most southerly part of our island.

The natural *vegetation* is of the scantiest description: there are no forests, and only a few plantations of oak, beech, and elm, clumps of pine on the links or sand-drift, and rows of willow and poplar along the banks of the canals. The principal cultivated plants are—oats, rye, and buckwheat; barley, wheat, and the leguminous crops in smaller quantities; potatoes, flax, hemp, tobacco to a considerable extent; madder, rapeseed, chicory, mustard, and beet; tulips, hyacinths, lilies, dahlias, and other garden flowers, for which the country around Haarlem has long been celebrated. There is nothing peculiar in the breeds of the domesticated *animals*; and the only wild ones deserving of notice are—hordes of rats and mice, which infest the cultivated grounds; frogs and other reptiles, which swarm in the canals; and the stork, which annually visits and breeds in the country, where it is specially protected for its valuable services in ridding the waters of their reptile exuberance. Water-fowl, wild and tame, abound in all the provinces; and the adjacent sea-banks swarm with herrings, cod, sole, ray, turbot, and other flat fish.

Of the *inhabitants*, about three-fourths are Hollanders or Dutch, speaking a variety of the German language known nowhere else in Europe; the remainder being the Frisians in North Friesland, the Germans in Luxemburg and Limburg, the Walloons or Flemings in Limburg, and about 50,000 Jews established in the principal towns. As to *religion*, the majority of the people are Calvinistic Protestants, with a regularly-constituted clergy; the minority consisting of Lutherans, Mennonites, Remonstrants, Roman Catholics, and Jews. There is, however, no dominant sect in the country: all forms of faith and ritual are alike tolerated; the clergy are indiscriminately maintained by the state; the universities are upheld in the same manner, and these are open to students of all sects, whose theological studies are conducted under professors of their own creed. The system of public education adopted in Hol-

land has been much and deservedly celebrated—being, upon the whole, one of the most complete in Europe relative to the establishment of schools, the appointment of teachers, and the course of instruction. The whole is under the superintendence of the minister of the interior, assisted by an inspector-general, from whom all changes, and new regulations, and the immediate working of the system, is deputed to local inspectors and boards of management. No teacher is allowed to exercise his profession until he has received a certificate of general qualification, nor to be appointed to any school until his fitness for that particular charge has been ascertained. The better-class schools are conducted by teachers at their own risk, but even these are not permitted without the sanction of the board. The next class are the Tusschen for tradesmen's children, who pay a small fee; and beneath these are the Armen or poor schools, in which the instruction is wholly gratuitous.

*Industrially and commercially* the Dutch have long been celebrated: the conversion of a worthless sea-marsh to a fertile country is evidence of the one feature; the extensive possessions which they at one time enjoyed in both hemispheres is proof of the other. At present their condition is somewhat stationary; their immoderate self-esteem, the tenacity with which they cling to established forms, and the tardiness of the national mind to comprehend and adopt improvements, having thrown them somewhat behind the adjacent countries. The nature of their *agricultural* produce has been already adverted to; and the careful, cleanly style in which they cultivate the soil and manage their dairies, as well as the manner in which they embank and drain their low plots or *polders*, are beyond all praise. The *fisheries*, once a principal source of wealth, have greatly declined; and *commerce*, in which the Dutch have always been pre-eminent, though vastly inferior to what it was in the seventeenth and part of the eighteenth centuries, is still a chief source of national wealth and employment, though likely again to suffer from the utter incapability of the country to compete in steam-navigation. The chief *manufactures* are those of woollen in Leyden and Utrecht; silks in Utrecht, Haarlem, and Amsterdam; cottons at Haarlem; tobacco-pipes at Gouda; and paper, leather, sugar-refining, painters' colours, and cordage, at various other places. The distilling of gin is extensively conducted at Schiedam; and ship-building at the ports of Rotterdam and Amsterdam.

The *government*, since the establishment of peace in 1815, has been a constitutional hereditary monarchy. The legislative power is vested in the sovereign and the States-General, which consists of two chambers—the upper of from 40 to 60 members, elected for life by the king; and the lower of 116 deputies, chosen by the people of the provinces every three years. Population, 3,414,374; revenue, £5,822,000; national debt, £101,462,000; army, 24,000; capital, Amsterdam, with a population of 220,000.

#### BELGIUM.

The Belgic provinces, which were united with the Dutch provinces under the Spanish dominions in 1548, continued after the revolt of the former to belong to Spain until 1717, when they were ceded to Austria, and were thence usually termed the Austrian Netherlands. During the usurpation of Napoleon, they were incorporated with France; but in 1815 they were separated from that kingdom, and united with the Dutch provinces, to form the kingdom of the Netherlands. Differing in religion and language, and finding their interests as a manufacturing people not always coinciding with those of the commercial provinces of the north, the Belgians in 1830 seceded from the Netherlandish monarchy, declared themselves an independent state, and in 1831 made choice of a king. Subsequently the limits of their territory were determined by the Five Great Powers, and thus Holland and Belgium became separate kingdoms. Situated between lat. 49°

27' and 51° 31' north, and long. 2° 37' and 6° east, it is consequently bounded on the north by Holland; east by Rhemish Prussia; south by France; and west by the German Ocean. Area, 11,351 square miles.

*Superficially*, the northern and western provinces of Belgium, in their flatness, fertility, dikes, and canals, may be regarded as a continuation of Holland—with this difference, that in no part does the surface fall beneath the level of the sea. 'The south and east provinces have an opposite character; they are generally more thinly peopled, less cultivated, and exhibit an irregular hilly surface, with tracts of marshy land and extensive forests. With the exception of these hilly districts, and some light sandy soils in the west, the whole territory presents a series of nearly level plains, traversed by numerous streams—the affluents of the navigable rivers Meuse, Sambre, Dender, Scheldt, Lys, &c.—delightfully diversified by woods, arable lands, and meadows of brilliant verdure, enclosed by hedge-row trees, and thickly studded throughout with towns and villages.' The *geological* formation of the flat district is precisely similar to that of Holland; but in the hilly provinces of the south and east very profitable developments of anthracite-coal, limestone, and red sandstone overlie primary schists, and these again are incumbent on porphyry, quartz, and granite. The chief mineral products of Liege, Namur, Hainault, and Luxemburg are—coal, iron, lead, copper, and zinc; besides which may be mentioned manganese, calamine, alum, various kinds of stone, slate, marble, whet-hones, and porcelain clay. Of the *mineral springs* arising from these formations, the most celebrated are those of Spa—whose waters are annually visited by thousands, and sent besides, in bottles, to all parts of Europe.

The *climate* resembles that of the south-east of England, but is, on the whole, more humid and variable; some districts, moreover, as Flanders, being at certain seasons rendered unhealthy by noxious exhalations from the water-courses and low polder lands. The *vegetation*, both natural and cultivated, is precisely the same as that of England and the north of France. The domesticated animals, if we except the excellent draught-horse of Flanders, are decidedly inferior to those of Holland and Germany.

The *inhabitants* are usually classed under two stocks—the Germanic and Græco-Latin. The former embraces the Belgians or Netherlanders, speaking the Flemish tongue, and a small number of German-Dutch in Limburg and Luxemburg. To the latter belong the Walloons of the southern provinces, who speak the French-Flemish and the Walloon—two uncouth primitive dialects of the French language. All *religions* are tolerated, but the Roman Catholic is that established in connection with the state, adhered to by nineteen-twentieths of the population, and administered by a regular priesthood, including one archbishop, five bishops, 165 curés, and not less than 4400 inferior clergy. Until the revolution of 1830, the Belgic provinces, as part of the Netherlands kingdom, enjoyed the same *educational* system as that described under Holland; but since that period a vast falling off is said to have taken place, especially among the lower orders, in consequence of government having abandoned all supervision and compulsion.

At present, the *industry* of Belgium is happily distributed between agriculture, mining, and manufactures; and under a continued peace and liberal government, bids fair to attain its ancient superiority. The Belgian or Flemish system of agriculture is well known over Europe for its minute and careful management; and no people understand better the method of collecting and preparing every species of manure, without which much of their sandy soil would be next to worthless. The *fisheries*, both inland and maritime, are rapidly increasing, principally, however, under a system of national bounty; and *mining* is carried on in a regular and efficient manner—that of coal employing about 32,000 hands, and the quantity of crude iron-ore raised being upwards of 10,000,000 tons. The most important

## EUROPE

*manufactures* are—woollen cloths, as at Verviers, Liege, Dalhem; carpets at Tournay; linens at St Nicholas, Ghent, Termonde, &c.; cotton goods, employing about 122,000 hands, at Ghent, Antwerp, Mechlin, and St Nicholas; superb lace at Brussels and Mechlin; ribbons at Antwerp, Tournay, Ypres; hosiery, employing about 50,000 hands, in various places; metallurgy at Charleroi, &c.; steam-engines, firearms, and machinery at Liege; hardwares and cutlery in various localities; porcelain at Sept-Fontaines, Brussels, &c.; glass at Namur, Liege, and Charleroi. The internal communication of the country is carried on by means of the rivers already noticed, a number of well-kept canals, good macadamised roads, and a national system of railways.

The *government*, as established in 1831, is a constitutional, hereditary monarchy, vested in the person and family of Leopold, Prince of Saxe-Coburg. The legislative power is exercised collectively by the king, senate, and house of representatives—the members of these chambers being elected by those citizens who pay not less than twenty florins (33s. 3d. sterling) annually in direct taxes. The number of representatives are as 1 to 45,000 inhabitants; the senators half as many as the representatives. The former are elected for four years, one-half retiring every two years; the latter for eight years, one-half retiring every four years. The chambers assemble of their own right annually in November, but the king has the right of convoking, adjourning, or dissolving them at pleasure. The executive is exercised by the sovereign, assisted by six responsible ministers—namely, of police, of the interior, foreign affairs, public works, war, and finance. For administrative purposes, the country is divided into nine provinces, and these again into *arrondissements*, communes, and cantons, after the model of France. Population, 4,298,562; revenue, £4,520,000; debt, £24,600,000; army, 32,000; capital, Brussels, with a population of 106,000.

### DENMARK.

This small but ancient kingdom occupies that peninsular and insular portion of Europe betwixt the German Ocean and the entrance to the Baltic Sea; and lies between lat. 53° 28' and 57° 42' north, and long. 8° 10' and 12° 38' east. The territory consists of *Jutland*, or the kingdom of Denmark Proper, which includes Zealand, Funen, Laaland, Falster, Moen, Langeland, Bornholm, and a number of smaller islands in the Baltic; the duchy of *Sleswick*, which comprises some adjacent islands\* on both coasts; and the duchies of *Holstein* and *Lauenburg*, which the king represents in the federative Diet of Germany. The aggregate area of the peninsula and islands is estimated at 21,856 square miles.

*Superficially*, both the peninsular and insular portions are low and flat; in many places rising little above the sea, and requiring the protection of mounds and dikes; and in no portion exceeding an altitude of 1000 feet. In Holstein, Sleswick, and the south of Jutland, the soil is for the most part extremely fertile, but little interrupted by marshes, and only occasionally light and sandy in the central districts. In the north and west of Jutland, on the other hand, large sandy tracts are prevalent, partially covered with bent, heath, and juniper, and utterly unavailable for culture. The soil of the islands is composed of calcareous sand and clay, which, though inferior in point of fertility to the meadows of Holstein, is, upon the whole, of average quality. The whole country, like Holland, is of recent marine formation, and consequently presents no rocks of economical value.

The *climate*, in consequence of the low-lying nature of the land, and the proximity of the surrounding seas to its most central portions, is, on the whole, much milder than the latitude would indicate. The distinguishing characteristics are humidity and changeable-

\* The rocky island of Heligoland, and the neighbouring low-lying sandy down, about 26 miles from the mouth of the Elbe, belong to Britain. Population, 2150.

ness. The indigenous *vegetation* is very scanty; there are now no forests, and what plantations exist, contain but an indifferent growth of birch, alder, ash, and beech. All the common grasses, rye, wheat, oats, potatoes, hemp, flax, and rape-seed, are raised in Denmark; in the duchies, hops and tobacco; and in several of the islands are large orchard-growths of apples, pears, cherries, and hazel-nuts. The characteristic features in the domesticated species are—the heavy Holstein breeds of the horse and ox; herds of fine porkers; and poultry in greater abundance, perhaps, than in any other country of Europe.

The *people*, with the exception of the Jews in Altona and Copenhagen, are of Teutonic origin, but belong to four different stocks—namely, the *Danes*, who constitute the majority, inhabit Jutland, Sleswick, and the islands, and speak a modernised form of the old Norse language; the *Germans* in Holstein and Lauenburg; the *Frisians* in the islands of Sleswick; and the *Angles* (a tribe of whom gave the name to England), found chiefly on the Baltic coast of Sleswick. Lutheranism is the established religion of the state, and is professed by almost all the people; but the fullest toleration is given to other creeds. 'Education,' says Mr Mauculloch, 'is very widely diffused, there being very few persons, even among the lowest classes, who are unable to read and write. Besides the universities of Copenhagen and Kiel, there are gymnasia or colleges at Sorøe and Altona, with grammar-schools and academies in all the considerable towns. Parochial schools, chiefly conducted on the Lancasterian system, are almost everywhere established, there being upwards of 4000; and here, as in Prussia, attendance at school is not optional; for, by a late law, all children from the age of 7 to 14 years must attend some public school, and if unable to pay, are educated at the public expense.'

*Industrially*, Denmark is more an agricultural than a manufacturing country, and perhaps more pastoral than agricultural. In embanking, draining, and the preparation of pastures and meadows, the inhabitants of the duchies show considerable skill—raising not only abundance for home consumption, but large supplies for export. The *fisheries* are also of considerable importance—the principal being the herring-fishery off Jutland, and that of cod in the North Sea. The government has afforded great encouragement to *manufactures*; but in no department (unless under the protection of exorbitant duties) can the people compete with foreigners, even in their own markets.

The *government* is a hereditary monarchy, formerly absolute; but in 1834 representative assemblies, with a consulting voice, were instituted in each of the four principal divisions—namely, the Islands, 70 representatives; Jutland, 51; Sleswick, 44; Holstein, 48; Lauenburg retaining its old constitutional diet. Population, exclusive of Iceland and the Farøe Isles, 2,202,074; revenue, £1,833,000; debt, £11,981,000; army, 25,000. Capital, Copenhagen, with 120,180 inhabitants.

### Iceland and the Farøe Islands.

*Iceland* is situated in the Northern Ocean, between lat. 63° and 66° 23' north, and long. 13° and 24° 21' west, being about 280 miles in its greatest length, and 200 in its greatest breadth. Its area is estimated at 38,250 square miles; population about 55,000, of Scandinavian or Norse origin. The whole island is of volcanic formation, recent, or still in progress; and in aspect is rugged and barren in the extreme. Only one-ninth is habitable, the remainder being covered with ice-clad hills, called Jökuls (highest 6802 feet), or narrow valleys, rendered equally desolate by lava and ashes ejected from numerous volcanoes—of which Hecla is the best known, though not the most destructive. Besides these evidences of subterranean heat, there are numerous boiling springs (geysers), which throw up water and steam to a great height, bogs of boiling mud, and dense clouds of sulphureous steam and smoke issuing from many places. The island, though merely touching the Arctic Circle, is essentially polar in its climate: trees are stunted, and seldom rise above 10 feet; the growth of corn is rarely if ever attempted; potatoes have been introduced with some success; several kinds of culinary vegetable are raised, but, with the exception of red cabbage,

few attain perfection. The main harvest is hay—the rearing of cattle forming, with fishing, the principal occupation of the people. There are no regular manufactures: stockings and mittens, however, knitted by the women, form articles of export; as do also wool, skins, dried fish, oil, eider-down, &c.

The *Faröe Islands*, also in the Northern Ocean, lie between lat. 61° 30' and 63° 20' north, and long. 6° and 8° west; about 185 miles north-west of the Shetland Islands, and 320 south-east of Iceland. The group consists of 23 bold rocky isles, 16 of which are inhabited; have an aggregate area of 495 square miles, and a Scandinavian population of 7000. The surface of the land consists of a succession of hills (the highest 2240 feet), with intervening stripes of valley, covered with a thin soil, on which is grown potatoes, turnips, and occasional patches of barley; hay, as in Iceland, being the principal crop. There are no trees, but there is abundance of peat for fuel, as well as coal. The wealth of the population arises chiefly from sheep-rearing, fishing, and fowling.

## SWEDEN.

This country occupies the eastern and more important section of the Scandinavian peninsula, and is situated between lat. 55° 20' and 69° north, and long. 11° 10' and 24° 12' east. Its extreme length is about 965 miles, and its average breadth 188: the area, including islands, is computed at 170,220 square miles.

*Physically*, the country presents several districts of very different aspect; the whole, however, declining from the Kölen and Dofrine ranges towards the basin of the Baltic. Starting with these, which have the character of an irregular table-land, about 20 or 25 miles across, and only at intervals studded with mountains of more than 5000 feet high, we find the general elevation between 2000 and 2800 feet, covered with straggling forests of pine and birch, and intersected by narrow valleys, whose depressions are occupied by lakes and torrents. From this tract the country descends by steps or plateaux—the first being of no great breadth, and from 700 to 800 feet above the sea; the second about 280 feet high, and more than 40 miles in breadth; the third from 90 to 110 feet; and lastly, a fringe of inconsiderable elevation above the Baltic. Throughout the whole of these, the rivers which rise in the mountain plateaux hold on their course, presenting numerous rapids and waterfalls; only a few of them, as the Angermans, being navigable during the two last stages of their descent. Such is the superficial character of Nordland and part of Sweden Proper. As we travel southwards through the latter territory, the face of the country becomes flat, or only diversified by the insignificant ridges which enclose the great lakes Weser, Wetter, &c. South of the lakes, the greater part of Gothland presents the same low and sandy character as the opposite coast of Denmark, and evidently belongs to the same recent marine formation. The most important *mineral products* are—iron (the best in Europe), copper, and lead in abundance; cobalt, zinc, antimony, gold and silver in minor quantities; marble, porphyry, limestone, and potters' clay.

Respecting *climate*, Nordland, part of which lies within the Arctic Circle, has from five to six months of winter; snow and ice then covering the mountains and rivers, and locking up the waters of the Gulf of Bothnia. On the other hand, the summer is sudden and short, but excessively warm; at midsummer, the sun never falls beneath the horizon north of Tornes; and the crops of oats and barley come to maturity in six or eight weeks. In the central parts, winter lasts only about four months, but is severe enough in most seasons to lock up the Baltic; and in the southern level tracts, the climate is very similar to that of northern Germany.

The *vegetable productions*, as might be expected from the high latitude and natural poverty of the soil, are by no means abundant. In the forests, which cover about 98,000 square miles, pines, firs, alders, and birches are prevalent in the north; these, with oak, elm, and ash in the central districts; and the beech, chestnut, mulberry, &c. only in the south. Apples, pears, and other garden fruits are grown in Gothland; the gooseberry family even within the Arctic Circle.

The cultivated products consist chiefly of rye, barley, oats, wheat, potatoes, peas, hemp and flax, buckwheat, madder, hops, and wood in the south; but as we proceed northward, most of these disappear, and oats, barley, maalin (a mixture of barley and oats), and potatoes are alone cultivated—oats ripening so far as 63° north, and a coarse variety of barley even to the limits of the pine-woods in 69° 50'. The principal *wild animals* are—the bear, wolf, wolverine, fox, lynx, badger, otter, squirrel, lemming, and other small rodents; with a few scattered members of the beaver family. Game-birds are everywhere rife, from the partridge to the capercaillie; rapacious species, as the golden-eagle, sea-eagle, horned and snowy owl, are also frequent; and aquatic birds, as the swan, geese, and a variety of ducks, appear in great abundance, either permanently or migrant. Seals and porpoises are found in the Baltic, whose waters also furnish plentiful supplies of cod, sole, turbot, pilchard, herring, stremming, mackerel, oysters, &c.; while in the rivers and lakes are sturgeon, salmon, trout, pike, and perch.

The *inhabitants*, with the exception of a few Finns and Laplanders, are wholly of Gothic descent, speaking a variety or dialect of the old Norse—the common root of the Danish, Norwegian, and other tongues. The *religion* of the state, and that to which almost the whole population adhere, is the Lutheran, administered by 1 archbishop, 11 bishops, and about 3000 inferior clergy. All other creeds are tolerated, but none but Lutherans are eligible to any employment under the state. The *educational institutions* of the country are of a superior description, and, like the church, are upheld and supervised by the state. There are upwards of 3000 elementary schools; high-schools or gymnasia in all the provincial capitals; and two universities—namely, that of Upsala and Lund. Attendance at the primary schools is not compulsory; but every adult must give proof of ability to read the Scriptures before he can exercise any act of majority.

*Industrially*, the Swedes are a busy, hardy, clear-headed, and progressive people. Of late years government has given great encouragement to agriculture, and the spirit being participated by the landholders, a very perceptible improvement has taken place—so much so, indeed, that from requiring imports of corn in 1826, Sweden is now a corn-exporting country. The *fisheries*—principally in herring, stremming, salmon, white fish, and lobster—are extensively and profitably conducted; and *mining*, especially in iron and copper, employs a considerable number of hands—about 90,000 tons of bar-iron being produced annually, and not less than 800 tons of copper. The *manufactures* are chiefly domestic, the peasantry supplying themselves, as winter employment, with nearly all the coarse woollens, linens, and cottons they require. There are, however, some cloth factories, sugar refineries, distilleries, leather, paper, soap, and glass-works in the larger towns.

The *government* is a limited monarchy, hereditary in the male line, and restricted to the Lutheran creed. The legislative power is vested in the king and representative Diet, consisting of four chambers—namely, nobles, clergy, burghers, and peasantry. The executive is managed by the king and a state council.

## NORWAY.

Norway occupies the western section of the Scandinavian peninsula; extends from lat. 58° to 71° 10' north, and from long. 5° to 31° east; and is bounded on the west and north by the Northern Ocean, east by Russian Lapland and Sweden, and south by the Skager Rack. Its greatest length is upwards of 1100 miles, and average breadth 50; area 184,300 sq. miles.

The *general aspect* of the country is bleak, rugged, and sterile; the shores are rocky and precipitous, and on the west fenced by numerous small islands, and indented by *fjords*. The interior consists chiefly of the mountain masses of the Kölen and Dofrefelds; rising in the north almost from the water's edge, and in the south spread out in plateaux or *fjelds*, intersected by

narrow valleys susceptible of a scanty culture, or by steep ravines, down which impetuous rivers cleave their way by rapids and waterfalls. The lowest tracts, and those to which cultivation is chiefly limited, occur round Christiansa fiord, and the adjoining shores of the Skager Rack, or to the south and east of the Bay of Troadheim. The geology of the country is primary, and yields, like the contiguous parts of Sweden, iron, copper, cobalt, zinc, marble, and slate.

The *climates* of a region, a large portion of which lies within the Arctic Circle, cannot of course be brought under one general description. Suffice it to say that it is milder, but more variable than that of Sweden under the same parallels. At Christiansa, winter lasts from the middle of September to the middle of May, and summer is short and warm; in Lapland, winter endures from August till May, and for many weeks the sun is invisible (the aurora borealis and stars being the only natural lights); while summer is short and fervid, the sun never sinking beneath the horizon.

The *inhabitants*, with the exception of the Laplanders, are members of the Teutonic race, and immediately descended from the old Scandinavian Norsemen—a dialect of whose language they employ. In *religion* they are Lutherans; but all other sects are tolerated save Jews, who are prohibited from settling in the country. In *educational* matters, Norway is indebted to her former connection with Denmark; in every parish there is a school for elementary instruction, academies or *laerde-skoles* in thirteen of the principal towns, and a university in the capital.

The *industry* of Norway is chiefly limited to her *forests*, which yield excellent timber, bark, and tar; to her *fisheries* of cod, haddock, herrings, lobsters, salmon, anchovies, &c.; to her *mines* and foundries of iron, copper, and cobalt; and to *shipping* (2280 vessels, navigated by 11,400 men), much of which is employed in the carrying-trade of other countries. *Agriculture* is in a very rude and primitive state; and the manufactures are almost wholly domestic.

With respect to *government*, Norway was an appanage of the Danish crown until 1814, when, by the convention of Kiel, it was placed under that of Sweden. It still, however, retains its own representative body or *storting* (which is essentially democratic); and is, in reality, no more connected with Swedish rule than Hanover was formerly with Britain. The executive is vested in a viceroy and council at Christiansa; and for administration, the country is divided into 5 *dioceses*, and these again into 17 *amts* or provinces. Aggregate population of Norway and Sweden, 4,306,600; revenue, £155,600; debt, £651,000; army, 50,000.

#### PRUSSIA.

This is one of the great European powers, occupying a large portion of northern and western Germany, part of what was formerly Poland, some detached patches in middle Germany, and to these may be added the Swiss canton of Neuchâtel, which acknowledges the sovereignty of the Prussian king. The country has thus an extensive and heterogeneous frontier, which weakens, or at all events keeps in check, that power which, in less than a century, added to the original duchy of Brandenburg the above-mentioned territories, and rose to the position of a first-rate kingdom. Its area, exclusive of Neuchâtel, is 107,842 square miles.

Its *physical aspect*, *geology*, *climate*, *vegetation*, and *animal* productions, are identical with those described under the north and west of Germany; the surface being generally level, with the exception of the hilly, mineral districts of Saxony and Silesia; the soil sandy, and often covered with heaths; defaced by large bogs and morasses, particularly in the north-east; presenting in most districts extensive forests of fir; and only generally fertile in Saxony and the Rhenish provinces. The chief hydrographical features not already adverted to are—the Oder, with its large tributaries the Neisse, Spree, Wartha, and Nets; portions of the Russian rivers Vistula and Niemen; the curious *Kuffe*, or fresh-

water lagoons, which communicate with the Baltic by navigable openings; and the celebrated thermal springs of Aix-la-Chapelle (143°).

The *people* of Prussia belong principally to the great Germanic and Sclavonic families—the Poles in Pozen, West Prussia, &c. belonging to the latter, and the bulk of the inhabitants in the other provinces to the former. German is the language of the court, as well as of the better-informed classes in all the provinces. The Lithuanians in East Prussia, the Vandals in Pomerania, and the Jews in the principal cities, do not exceed perhaps 250,000. With regard to *religion*, all sects and creeds enjoy the amplest liberty; nearly three-fifths professing the evangelical faith, two-fifths that of the Roman Catholic, the fraction being Jews, Memnonites, Rationalists, &c. 'In no other country is the *system of education* so complete; and in none is the instruction of all classes so carefully provided for. The law imposes upon parents the strict obligation of sending their children to school, unless they can prove that they are giving them a proper education at home; and care is everywhere taken to furnish the poor with the means of complying with this law, by providing their children with the things necessary, and even with clothes. Every parish is bound to have an elementary school, and every town one burgh-school or more, according to the population. Above these are gymnasia, and in these institutions classical learning is pursued preparatory to admission into the universities, of which there are seven—in the cities of Berlin, Breslau, Halle, Bonn, Königsberg, Münster, and Greifswald.' Besides these there are normal schools for the training of teachers, establishments for instruction in particular arts, and collections of natural history, philosophical apparatus, and public libraries, accessible to any person who chooses to avail himself of their assistance. The whole of this admirable system is upheld partly by private fees, partly by the respective towns and provinces, and partly by the state; the whole being under the strict and unremitting surveillance of government functionaries.

The *national industry* has been already detailed under that of the German Confederation. Prussia, however, is mainly an agricultural country—the Rhenish provinces, Saxony and Silesia, being as yet the only manufacturing districts. Internal communication is conducted by means of several good lines of road; by the great rivers, which are all less or more navigable; and by the great German lines of railway.

*Government*, a hereditary monarchy, with a council of state; and since 1824, provincial assemblies, to whom laws are submitted for deliberation. For administrative purposes, the country is divided into ten provinces, which are subdivided into regencies, and these again into circles. National debt about £22,515,000; revenue, £8,650,000; expenditure, £8,700,000; standing army, 150,000—the war complement, 357,000 men.

#### RUSSIA.

The Russian Empire comprises the whole northern region of the eastern hemisphere, from the frontiers of Prussia and the Baltic on the west to the Pacific on the east; crosses Behring's Straits, and includes a portion of North America in the western hemisphere; together with a number of islands in the adjacent seas. Much of this vast territory—which amounts to nearly one-seventh of the terrestrial part of the globe—is, however, uninhabited, and indeed unfit to be so; the greater portion rude and ungenial, and but thinly tenanted by semi-barbarous tribes; and only that section in central Europe entitled to be ranked with civilised nations. European Russia, to which we now limit our description, is bounded on the north by the Arctic Ocean; east by the Oural Mountains and the Caspian; south by the Caucasian range and the Black Sea; and west by Turkey, Austria, Prussia, and the Baltic. The area is estimated at 2,045,000 square miles.

*Superficially*, the territory may be regarded as one vast plain, with a slight elevation running diagonally

across the interior, and forming the great water-shed which diverts the rivers to the Arctic Ocean on the one hand, and to the Caspian and Black Seas on the other. If we except the Ouralian Mountains on its eastern border, and a hilly tract in the Crimea, there is no portion of the country which rises more than 1100 feet above the sea, and that only near Valdai in the central plateau. 'The northern section, which sensibly declines,' says a native author, 'towards the White and Frozen Seas, is covered with vast forests, abounds in marshes and lakes, and is but little fit for cultivation. The other, and more southerly portion of the plain, includes the whole district along the Wolga, as far as the sandy steppes or deserts between the Caspian and the Sea of Azov, and constitutes the finest part of Russia: generally, it has a fertile soil, the arable and pasture land preponderating over the woods and marshes. That part of the country which extends towards Voronej, Tambor, Penza, and Simbirsk, as far as the deserts, is remarkable for the superior quality of every kind of fruit and other produce. It has everywhere an excellent soil, consisting of black earth, strongly impregnated with saltpetre. But the tract which commences between the Sea of Azov and the Caspian, and extends near the shores of the latter, and between the Wolga and Oural, as far north as the Samara, is little better than a desert, being level, dry, high, barren, and full of salt lakes.'

The rock formations of Russia present much less variety than might be expected from the extent of the country, chiefly in consequence of the flat and unbroken manner in which they lie. The chief economic minerals are—gold, platina, silver, lead, and copper from the Oural; copper and tin in Finland; iron from the central elevation of Valdai, &c.; coal in Poland, Toula, and Ikatherinoslav, but of little importance; rock-salt and brine-springs in Poland, Taurida, Perm, and other places; lime, alabaster, gypsum, and amber.

The climate of Russia is said to be much colder than that of other European countries in the same latitude; and the farther we proceed eastward, the temperature becomes still lower, in consequence of the uncultivated state of the surface, distance from the tempering influences of the ocean, and the frequency of easterly and northerly winds from the icy regions of the Arctic Ocean. In the northern section the winter is severe, and lasts from eight to nine months; all the rivers and seas are frozen, and the ground deeply covered with snow: summer, on the other hand, is short and hot; and there is, generally speaking, neither spring nor autumn. In the central region winter is also severe, but shorter; there is something like spring and autumn, and summer is still warmer. In the south, winter continues only for about five months, freezing the rivers and shores; and summer is often fervid and oppressive. The provinces bordering on the Baltic have a wet and variable climate, and this feature extends to the elevated tract which borders the upper basin of the Wolga; but farther eastward, and in the extreme north and south, the atmosphere is clear and dry—a circumstance which materially modifies the effects of the winter's cold.

The vegetable and animal productions present less variety than might be expected from a region lying between the 45th and 70th parallels. The most remarkable feature in the former is the vast expanse of forest growth, covering about two-fifths of the entire superficies. As already hinted, these are most extensive in the north and central regions, especially between the 55th and 60th parallels, where it has been said that a squirrel might travel between St Petersburg and Moscow without touching the ground. Among the cultivated plants we may notice rye all over the country, barley to 67° north, oats to 62° north, wheat in the fertile tracts along the southern rivers, millet along the Don, hemp and flax in the west and centre, tobacco in the Ukraine, cranberries in the marshes of the north, fruit in the south-east, the vine in the Crimea and Caucasian provinces; and variously, potatoes, rape, rhubarb,

poppy, &c. The characteristic wild animals are—the polar bear, the black and brown bears of the forest, the reindeer, elk, urus, wild horse of the Ukraine, wolf, blue fox, lynx, beaver, sable, ermine, lemming, &c.; game, but not abundantly; the sturgeon, salmon, trout, carp, pike, mackerel, and a variety of other fishes in the rivers; and the bee, whose honey and wax form valuable products of consumption and export.

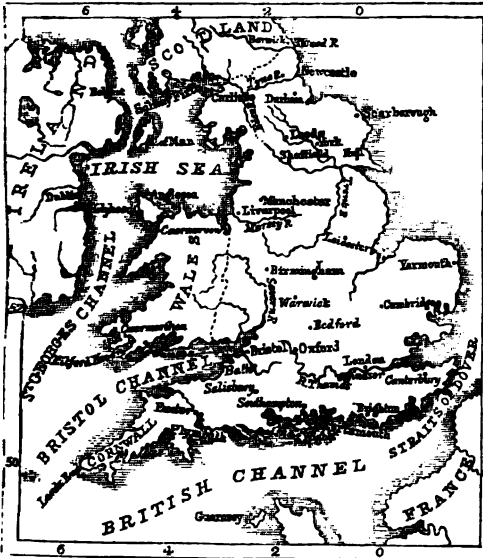

The population of the country, amounting to 60,000,000, is composed of a vast variety of races, differing in language, religion, manners—from the rudest state of barbarism to the highest point of European civilisation. Laying aside minor distinctions, they may be classed under the following stocks:—The *Solavonic*, including the Russians Proper, the Poles, Bulgarians, and Servians; the *Finns* of Finland, Lapland, and Esthonia; the *Lettish* tribes of the Baltic provinces; the *Toorkees* of the Caucasus, Astrakhan, Kazan, the Crimea, &c.; the *Deutsch* or *Germans* in Riga, Revel, and St Petersburg; the *Goths*, including the Swedes of Finland; and in lesser numbers Danes, Jews, Greeks, French, and English. The settled inhabitants are ranked in four classes—nobles, clergy, citizens, and peasants; the peasants being either freemen with limited privileges, or serfs belonging to the soil, and transferable like any other species of property.

All forms of religious faith are tolerated; but that of the orthodox Greek Church prevails, and is adhered to by the Russians, Servians, Cossacks, &c. The Roman Catholic faith is professed by the Poles and Lithuanians; the Swedes, Danes, Finns, and most of the Germans are Lutherans; Calvinism reckons but a small number of Poles and Germans; Islamism is the creed of the Toorkee or Tartars; and the Jews observe the Mosaic ritual. *Educationally*, the country is in a very depressed state, if we take into account only the peasants and lower orders; but among the citizens and higher classes there is a more general dissemination of knowledge than is generally believed. According to an educational scheme drawn out in 1802, somewhat similar to that of Denmark, a certain number of universities, lycœums, and elementary schools were to be erected, upheld, and conducted under government; but only a few of these have as yet been established.

The industrial operations of the country are as yet conducted in a very primitive manner, and upon a limited scale, considering the vastitude of the natural resources. *Agriculture* is in its first stage, and yet, owing to the excellency of the soil and comparatively small home demand, large supplies are annually exported. Of late years, *manufactures*, under high protective duties, have risen to some consideration, and the country now possesses a number of establishments for the preparation of woollen goods, silk, cotton, linen, and metal wares. The chief seats of these are the governments of Moscow, Novgorod, Vladimir, Saratov, Toula, and St Petersburg. 'The Russians,' says Waterston, 'excel in the manufacture of leather; and from their advantages in respect to raw material, their canvas, strong linens, cordage, felt, mats, potash, soap, candles, caviar, and isinglas, are quite as good as those made elsewhere; but in all other branches their productions cannot compete with those of Western Europe, especially Britain, as to finish, durability, and cheapness; and their existence is therefore dependent upon a prohibitory system of export duties.'

The government is an absolute hereditary monarchy; all power emanates from the czar, emperor, or autocrat, whose authority is without limit or control. He is the central point of the administration, the head of the church as well as of the state, and to his decision, or for his sanction, all important measures must be submitted. His authority is delegated to certain boards, the members of which are of his own appointment; and to these respectively are committed the ordering and execution of all legislative, judicial, civil, religious, financial, and other affairs. Population, 60,362,250; revenue, £16,380,000; debt, £76,800,000; army 500,000. Capital, St Petersburg, with 476,000 inhabitants.

## ENGLAND AND WALES.

ENGLAND and the principality of Wales, which we shall treat as one incorporated country under the former of these names, occupy the most southerly, and at the same time the largest and most fertile, portion of Great Britain—an island, the position of which is at once favourable to commerce, to security, and to national independence. Placed in a medium latitude, it is further preserved by the surrounding ocean from those extremes of heat, and cold, and aridity, to which continental countries, both in higher and lower parallels, are frequently subjected. England, then, is bounded on the north by Scotland, from which it is chiefly separated by the Solway Firth and the Cheviot hills; on the east by the German Ocean; on the south by the English Channel; and on the west by St George's Channel and the Irish Sea. The space thus included is rather irregular in form, and lies between lat.  $49^{\circ} 57'$  and  $55^{\circ} 45'$  north, and between long.  $5^{\circ} 41'$  west, and  $1^{\circ} 46'$  east. Measuring along the second meridian, from St Alban's Head on the south to Berwick on the north, its length is 362 miles; its breadth, from Land's End to North Foreland in Kent, 330 miles; from St David's Head in Pembroke to Lowestoft in Suffolk, 300; from Lancaster Bay to Bridlington Bay in Yorkshire, 110; and from the Solway Firth to Tynemouth, only 64 miles. Its area is estimated at 57,812 square miles, or nearly 37,000,000 acres, of which 5,200,000 belong to Wales.

### SUPERFICIAL FEATURES.

The superficial features of England, though not devoid of variety and picturesque beauty, are, upon the whole, less diversified than those of Scotland and Ireland. Generally speaking, its western side—from Cumberland and Westmoreland, southwards through Wales, into Devon and Cornwall—is hilly or mountainous; while the eastern side, sloping from these heights down to the German Ocean (as evidenced by the direction of the principal rivers), is of an undulating, flat, and sometimes monotonous character. The chief mountain-ranges which give character to the country have been classed under three heads:—1. The *Devonian Range*, stretching from Gloucester, through

No. 64.

Somerset, Devon, and Cornwall, and terminating in the promontory of the Land's End—the highest point of which is Cawsand Beacon in Devon, 1792 feet; 2. The *Cambrian Range*, extending from the Bristol Channel, through Wales, the culminating point of which is Snowdon, 3571 feet; 3. The *Northern or Cambrian Range*, stretching from Derbyshire, through Cumberland, and passing into Scotland, whose loftiest peak is Skafell in Cumberland, 3166 feet. In the central and eastern parts of the country (south of Yorkshire) there are a few ill-defined ranges of swelling eminences; but none which exceed 1020 feet. The chalk-hills or *Downs* of southern England are inconsiderable eminences, radiating in different directions from the tableland of Salisbury Plain in Hampshire, the highest point of which is only 1001 feet. Besides Snowdon and Skafell, the principal heights in England are David (3427 feet), and Llewellan (3469), both in Wales; Skeddaw (3022), and Saddleback (2787), in Cumberland; and Helvellyn (3055), in Westmoreland.

In contradistinction to these mountain-ranges are the moors, vales, marshes, and other level tracts, which constitute no inconsiderable portion of the surface. The principal *moorlands* are those of Northumberland, extensive, open, solitary wastes, producing little except heath, at an elevation of from 500 to 1000 feet above the sea; the moors of Durham, in the Lead-Mines district; those of Cumberland and Westmoreland, inseparably blended with the mountains of those counties; those of Yorkshire, forming a wide elevated tract, ungenial in soil and climate; those of Staffordshire, at an elevation between 500 and 1154 feet; Dartmoor in Devonshire, covering upwards of 240,000 acres, at a mean elevation of 1700 feet, and of extreme ruggedness; Exmoor, partly in Devon, and partly in Somerset, consisting of 20,000 acres, for the most part bleak, waste, and irreclaimable; and the heathy uplands of Surrey, Hunts, and Dorset.

The *vales* or *dales*, traversed generally by the rivers, form an important feature in the geography of England; their verdure, shelter, and fertility being unsurpassed by any other portion of Europe. The principal are—the Vale of York, about 60 miles in length, and of variable breadth, occupying an area of 640,000 acres; Holderness, lying between the Humber and the sea, in the south-eastern part of Yorkshire, 270,000 acres; the vale in which Carlisle is situated, 300,000 acres; the Vale of the Severn, extending through Gloucester and Worcester for nearly 40 miles; the Vale of Exeter, 128,000 acres; the Vale of Taunton, 64,000; the *Wealds* of Southern England; and the minor dales of the Tyne, Wear, and Tees. The low marshy district called the *Fens*, lying around the Wash, principally in Cambridge and Lincoln, but partly also in Northampton, Norfolk, Suffolk, &c. forms a level tract of not less than 500,000 acres—apparently of recent elevation above the waters of the German Ocean. For the last two centuries much engineering skill and capital have been expended on the drainage and reclaiming of these fens, and the result has been the acquirement of extensive tracts of the richest and most fertile alluvium. Of the surface thus described, probably not above one-ninth (Wales being included) is unsusceptible of tillage, or at least of profitable improvement.

### GEOLOGICAL STRUCTURE.

Geologically, England exhibits traces of every formation; its western or hilly region being chiefly granitic and primary, and serving as a basis for the other formations, which take on in succession, till we reach the chalk and tertiary beds in the south-eastern portion. The range or strike of these formations is in a north

and south direction, so that a geological map exhibits them (not taking minor interruptions into account) like so many longitudinal bands overlapping each other, from the slates of Cornwall and Wales, to the chalks and tertiary clays of Kent and Middlesex. These formations display most of the subordinate groups of the geologist (see No. 2), with all their characteristic animal and vegetable remains in great perfection.

Thus, in Cornwall and Devon eminences of granite, serpentine, and porphyry occur, while the slopes resting on them are composed of different kinds of slate. The granite of this district is extensively used for paving in London, though considered less hard and durable than that brought from Scotland. The Welsh mountains are composed chiefly of varieties of slate, with some intermixture of volcanic rocks, as basalt and trap; while a rich coal-field, 100 miles in length, and from five to ten in breadth, rests upon their southern verge, extending from Glamorgan into Pembrokehire, being the largest coal-field in Great Britain. The northern range of mountains is also chiefly composed of slate rocks, there being only one mountain of granite near Shap in Westmoreland. Between these ranges of mountains, and a line drawn from Exmouth, through Bath, Gloucester, Leicester, Nottingham, and Tadcaster, to Stockton-upon-Tees, the surface is composed of the lower secondary strata, including rich beds of coal, the existence of which in this situation is mainly what has enabled England to become the first manufacturing country in the world. The eastern parts of the counties of Durham and Northumberland, from the Tees northward to Berwick, form a peculiarly valuable coal-field, of numerous beds, from which the metropolis and other cities in the east of England and elsewhere are supplied with this important mineral. Another coal-field of great value, and that upon which the manufactures of Manchester depend, extends northwards from Macclesfield to Oldham, and thence westwards to Prescot near Liverpool. A coal-field near Wolverhampton, in Staffordshire, is the most valuable in the centre of England: upon it depend the extensive metallic manufactures of Birmingham.

To the east of the line drawn from Exmouth to Bath, and thence by Gloucester, Leicester, and Tadcaster, to Stockton-upon-Tees, we find the upper rocks of the secondary formation, presenting in succession red sandstone and red marl, lias limestone and clay, oolitic limestone, green sand with clay, and finally chalk. Connected with the red marl, vast masses of rock-salt are found; these are extensively dug in Cheshire and Worcestershire for domestic use. Lias, which extends from Lyme in Dorsetshire to Whitley in Yorkshire, is remarkable for the remains which it presents of the large saurian reptiles. Beds of oolitic limestone cover the southern part of Gloucestershire, and a great part of Oxfordshire, Northamptonshire, Rutlandshire, and the eastern side of Lincolnshire. The chalk exists everywhere to the south-east of a line commencing near Dorchester, on the south coast, and passing through Wilts, Berks, Norfolk, and so on to Flamborough Head—excepting in Sussex and Kent, where it has been carried off by denudation, exposing a peculiar formation called the *walden*, and in the bed of the Thames near London, and one or two other places, where tertiary beds of clay occur. To sum up—the economic *mineral produce* of England consists chiefly of granite, roofing-slate, limestone, some marble, coal, both bituminous and anthracite, building-stones of various kinds, rock-salt, alum, potters' clay, fullers' earth, and siliceous sands; the *metallic* of copper, tin, lead, silver, zinc, manganese, iron, antimony, arsenic, and plumbago. The main depositories of the metals are the hills of Cornwall, Devon, Wales, and Cumberland. Iron, as a clay carbonate, is chiefly obtained from the shales of the coal-measures. The principal coal-fields are those of Durham and Northumberland, Lancashire, Stafford, and South Wales. Rock-salt and brine springs are found only in Cheshire and Worcester; and plumbago almost solely in Borrowdale, Cumberland.

## HYDROGRAPHY, &amp;c.

The *gulfs, bays, straits*, and other arms and indentations of the oceans which surround England are, with one or two exceptions, of limited dimensions. On the east coast are—the estuary of the Humber, receiving the waters of several rivers; the Wash, a large shallow inlet full of sandbanks and mud-shoals; Harwich Harbour; Blackwater Bay; and the estuary of the Thames, also incumbered with numerous intricate shoals and sandbanks. On the south are—the irregular expanse formed by the Solent and Spithead roads, and Southampton water, the last of which runs inland for ten or twelve miles, and is navigable to its extremity; Plymouth Sound, celebrated for the stupendous breakwater which protects its water from the swell of the Atlantic; Falmouth Harbour, and Mounts Bay, so called from St Michael's Mount, a curious insulated rock a little off the mainland. On the west are—Barnstaple Bay; Bristol Channel, a deep gulf 25 miles wide at its entrance, and about 8 where it joins the estuary of the Severn; the bays of Swansea and Caermarthen; Milford Haven, one of the safest and most capacious harbours of England; St Bride's Bay; the large bays of Cardigan and Caernarvon; the estuaries of the Dee, Mersey, and Ribble; and Morecambe Bay, a large inlet, so shallow that proposals were at one time made to reclaim it from the sea. The straits are those of Dover, 21 miles across, and about 17 fathoms at its deepest part, supposed by geologists to be of recent excavation—England before that event having been attached to the main continent; and the Menai Strait, separating the island of Anglesea from the mainland of Wales, about 14 miles in length, and varying from 2 miles to 200 yards across. This strait is crossed by a magnificent suspension-bridge, erected by Telford in 1826; and is now in course of being spanned by a suspension railway-tube or tunnel of still more gigantic proportions and curious construction.

The principal *capes* are Flamborough Head, Spurn Head, North Foreland, and South Foreland on the east; Dungeness, Beachy Head, St Alban's Head, Portland Point, Start Point, Bolt Head, and Lizard Point on the south; Land's End, Hartland Point, St Goven's Head, St David's Head, Stumble Head, Holyhead, Ormes Head, and St Bee's Head on the west; and Air Point in the Isle of Man. All of those mentioned on the east and south, and the two last on the west, are the sites of lighthouses, indispensable to the safety of the immense coasting trade of the country.

The *islands* geographically connected with England are, with one or two exceptions, small and unimportant. Off the east coast are—Holy Isle or Lindisfarne, containing the remains of an abbey and castle; the Farns, a dangerous group of small rocky islets; Foulness and Sheerness at the entrance of the Thames; and the Isle of Thanet, formed by two branches of the small river Stour. Off the south coast—the large, beautiful, and salubrious Isle of Wight, sometimes called 'The Garden of England;' Purbeck and Portland Islands, noted for their quarries; the Eddystone rock, with its celebrated lighthouse; and the Scilly Islands—a group consisting of seventeen rocky islets, thirty miles west-south-west from the Land's End. Off the west coast—the small islands of Lundy, Skomer, Bardsey, Holyhead, and the Skerries; the large island of Anglesea; and the Isle of Man, which, legislatively and judicially, forms a sort of independent territory. (For Jersey, Guernsey, &c. see No. 63, p. 193.)

The *lakes* of England are few, and of very tiny dimensions; the largest scarcely covering an area of four square miles; but the beauty of their associated scenery has conferred on them an almost universal reputation. We refer to the lakes of Cumberland, Westmoreland, and the north of Lancashire; the largest of which are Winandermere, Ulleswater, Thirlmere, Derwentwater, Bassenthwaite, Buttermere, and Crummockwater. These lie amid the vales and recesses of the Cumbrian range; and it is the combination of Alpine wildness and graz-

deur, with the soft scenery which reposes in clothed slope and mirror-like lake, which gives to the 'Lake District' its principal charm. (See p. 214.)

The principal rivers of England, beginning with those falling into the German Ocean, are as follow:—The Tyne, Wear, and Tees, all navigable to a certain extent by means of steam-tugs, and forming valuable channels of communication with the inland coal-fields of the district; the Humber, with its larger tributaries the Ouse, Wharfe, Aire, Calder, Don, and Trent, draining an immense tract of fertile country, and navigable to a considerable distance by barges; the Witham, Welland, Nen, and Great Ouse, which fall into the Wash, also navigable to a great distance inland; the Thames, with its numerous small feeders, the Charwell, Windrush, Kennet, &c.—the 'Father of English rivers,' navigable by ships of all burden up to the docks of the metropolis; and the Medway, with its open estuary, navigable by the largest vessels up to Chatham. The largest falling into the Atlantic are the Severn, with its affluents Wye, Teme, classic Avon, and lower Avon, all forming valuable channels of communication with the interior; the Dee, navigable to Chester; the Mersey, the great outlet for the manufacturing districts of the west; the Ribble; and Eden.

Connected with these are many minor streams, which contribute to the beauty and fertility of the country; and also a number of springs, celebrated for their mineral and medicinal properties. The principal of these are the salt springs of Northwich, Nantwich, &c. in Cheshire, and of Droitwich in Worcester, which yield salt in immense quantities; and the medicinal springs of Bath, Bristol, Cheltenham, Tunbridge Wells, Epsom, Leamington, Matlock, Burton, and Harrogate. Some of the latter are thermal or hot springs—*as* Bath, at a temperature of 114°; Buxton, 82°; Bristol, 74°; and Matlock, 68° Fahrenheit.

## CLIMATE.

The climate of England, according to Macculloch, 'is chiefly characterized by the absence of extremes in temperature, by humidity, and by almost incessant variations within a limited range; peculiarities ascribable to the geographical position of the country, in contiguity with an extensive continent on the one hand, and a vast ocean on the other: the latter with nearly the same temperature throughout the year, and exerting an equalising influence over the contiguous atmosphere; the other with a varying temperature, above that of the ocean in summer, and lower during the winter months. Hence the origin and direction of the prevailing winds at different periods of the year, according to whichever of those great surfaces exert most rarefying power: those blowing from the continent being comparatively dry, whilst those from the ocean, being charged with its exhalations, bring the chief part of the rain which descends, two-thirds of it falling on the west side of the country.' The average temperature in winter is about 40° Fahrenheit; in summer the day temperature is generally about 60°, very rarely 80°. The mean fall of rain for the whole kingdom is about 36 inches; though in Cumberland, for example, there is said to fall 60 inches, and in the neighbourhood of London only 23. The prevailing winds are from the south-west and west; the next in order of frequency from the north-east.

Being more inclined to cold and humidity than that of continental countries under the same latitude, the climate is more favourable to the growth than to the ripening of vegetable productions. It is certainly not unfavourable to either the physical or moral condition of the people. Perhaps even its uncertainty has been the subject of too much grumbling. On this point we may adduce the cheerful opinion of Charles II., as recorded by Sir William Temple. 'I must needs,' says Sir William, 'add one thing more in favour of our climate, which I heard the king say, and I thought new and right, and truly like a king of England that loved and esteemed his own country: it was in reply to

some of the company that were reviling our climate, and extolling those of Italy and Spain, or at least of France. He said he thought that was the best climate where he could be abroad in the air with pleasure, or at least without trouble and inconvenience, the most days of the year, and the most hours of the day; and *this he thought he could be in England more than in any other country in Europe.*' Devonshire, and some adjacent districts on the southern coast, enjoy a temperature which in winter is, at an average, two, three, four, and even in some instances five degrees above the rest of the country; and these districts are therefore recommended for the residence of persons affected by pulmonary disease.

## BOTANY AND ZOOLOGY.

Though the native vegetation of the country may be described as verdant and luxuriant, yet most of the fruits, ornamental trees and shrubs, bread-corns, green-crops and roots, are exotics which have become naturalised by a long course of care and culture. Without drawing any distinction, however, between what is indigenous and what of foreign importation, we may enumerate the following as the most important of her vegetable productions:—In some of the southern parts the vine grows luxuriantly, but seldom brings its fruit to perfection; at ordinary elevations, and all over the kingdom where suitable soil is to be found, the pear, apple, medlar, cherry, gooseberry, currant, strawberry, raspberry, and other fruits come to perfection; and the same may be said of the bread-corns—wheat, rye, barley, and oats—of beans and pease, of the potato, hop, turnip, carrot, beet, hemp, flax, rape, buckwheat, wood, madder, teasel, the artificial grasses, and a vast variety of useful and ornamental vegetable products. At elevations under 700 feet or thereby, most of the timber trees and ornamental shrubs—as the oak, beech, sycamore, poplar, elm, ash, hornbeam, maple, lime, laurel, laburnum, chestnut, yew, larch, and pine—attain a profitable growth; up to 900 or 1000 feet, the ash, alder, hawthorn, and pine continue to thrive; but above that height, the mountain ash, some of the smaller willows, the cranberry, bilberry, juniper, and heaths are the only inhabitants. One peculiar feature in the vegetation of England is the royal forests, of which the New (67,000 acres), Dean (23,000), Woolmer (6000), Whittlebury (5400), Windsor (4400), Delamere (3800), and Whitehead (3700), are the most extensive.

The zoology of England, like that of all other highly-civilised countries, is almost entirely limited to animals which can be profitably domesticated. Confining their attention to the latest superficial deposits, geologists have determined that at no very distant era the country was peopled with elephants, hippopotami, the wild horse and ox, bears, hyenas, wolves, elks, the wild boar, beavers, &c.; but these have now entirely disappeared, partly from cosmical conditions, and partly through the agency of man. The existing quadrupeds in a wild state are the fox, badger, polecat, marten, otter, weasel, stoat, hedgehog, mole, squirrel, hare, rabbit, a few species of bat, and several species and varieties of the rat or mouse family. The fallow-deer and roe exist in a protected or half-wild state, as does also the *urus* or wild ox, still preserved as a curiosity in some of the parks of the nobility. Of reptiles, there still exist the adder, common snake, and blindworm, the frog, toad, and lizard; but none, save the first, are at all venomous. Of birds, there are an immense variety, partly indigenous, and partly migratory visitants. The most curious and valuable of these are the bustard, quail, grouse, ptarmigan, partridge, pheasant, and blackcock; the geese and ducks of the fens; the eagle; the nightingale, which is seldom heard north of the Humber; and the turtle-dove, a summer visitant of the southern counties only. Of marine animals, a few of the porpoise family frequent the seas; the herring and mackerel are caught chiefly on the east coast; the pilchard exclusively on the south; cod, haddock, whiting, ling, and hake in various parts; oysters fattened principally on

the south and south-east; the scallop, cockle, periwinkle, limpet, &c. on rocky shores, which are also frequented by the crab and lobster. In several of the rivers salmon are found, though somewhat scantily, and sturgeon are occasionally met with; but in most of the fresh waters, eels, dace, trout, bream, perch, pike, and other fishes are abundant.

Of the domesticated animals, England possesses some first-rate varieties—as the racer, Cleveland bay, Suffolk punch, and old English black of the horse; the Hereford, Gloucester, and Teeswater of the ox; the Leicester and South Down of the sheep; and the Berkshire and Rudgwick of the pig—all of which are described at length in Nos. 37-40 inclusive.

PEOPLE—POPULATION.

Ethnologically, the constituent elements of the English population are to be traced in the history of the country. The first inhabitants were Britons, probably a mixed Celtic race, and who, during the time of the possession of the country by the Romans, must have become slightly changed by the admixture of that race. Upon a scattered population of Romanised Britons came the great wave of the Saxon invasion in the fifth and sixth centuries. After this, the predominant element of English society was undoubtedly Saxon, the Norman Conquest only adding to it a French aristocracy, which little affected the great bulk of the population. The English, therefore, exclusive of the Welsh, who are Britons almost unchanged, may be regarded as in the main a Teutonic people, an admixture of British entering into the composition always less and less as we advance from Wales towards the eastern coasts, where the people are nearly pure Saxon.

According to an acute writer in Blackwood's Magazine for 1829, 'the Saxon Englishman is distinguished from other races by a stature rather low, owing chiefly to the neck and limbs being short, by the trunk and vital system being large, and the complexion, eyes, and hair light; and by the face being broad, the forehead large, and the upper and back part of the head round, and rather small. In his walk, the Englishman rolls, as it were, on his centre. This is caused by the breadth of the trunk and the comparative weakness of the limbs. The broader muscles, therefore, of the former, aid progression by a sort of rolling motion, throwing forward first one side and then another. . . . The mental faculties of the Englishman are not absolutely of the highest order; but the absence of passion gives them relatively a great increase, and leaves a mental character equally remarkable for its simplicity and its practical worth. The most striking of those points in English character, which may be called fundamental, are *cool observation, unparalleled single-mindedness, and patient perseverance*. This character is remarkably homogeneous.

The cool observation of the Englishman is the foundation of some other subordinate, but yet important points in his character. One of the most remarkable of these is, that real curiosity, but absence of wonder, which makes the *nil admirari* a maxim of English society; it is greatly associated also with that reserve for which the English are not less remarkable. The single-mindedness of the Englishman is the foundation of that sincerity and bluntness which are perhaps his chief characteristics; which fit him so well for the business of life, and on which his commercial character depends; which make him hate (if he can hate anything) all crookedness of procedure, and which alarm him even at the insincerities and compliances of politeness. The perseverance of the Englishman is the foundation of that habitude which guides so many of his own actions, and that custom in which he participates with all his neighbours. It is this which makes universal cant, as it has been profanely termed, not reasoning, the basis of his morals; and precedent, not justice, the basis of his jurisprudence. But it is this also which, when his rights are outraged, produces that grumbling which, when distinctly heard, effectually protects them;

and it is this which creates that public spirit, to which, on great emergencies, he rises with all his fellow-countrymen, and in which he persists until its results astonish even the nations around him.

Now a little reflection will show, that of the three fundamental qualities I have mentioned, the first seeming may easily be less amiable than the final result shall be useful. To a stranger of differently-constructed mind, the cold observation, and, in particular, the slowness and reserve which must accompany it, may seem unsocial; but they are inseparable from such a construction of mind, and they indicate not pride, but that respect for his feelings which the possessor thinks them entitled to, and which he would not violate in others. The dignity, therefore, which in this case the Englishman feels, is not *hauteur*; and he is as rarely insolent to those who are below, as he is timid and deferent to those who are above him.

In regard to the absence of passion from the English mind, it is this which forbids one to be charmed with music, to laugh at comedy, to cry at tragedy, to show any symptom of joy or sorrow in the accidents of real life; which has no accurate notion of grief or wretchedness, and cannot attach any sort of meaning to the word ecstasy; and which, for all these reasons, has a perfect perception of whatever is ridiculous. Hence it is, that in his domestic, his social, and his public relations, it is perhaps less affection than duty that guides the conduct of an Englishman; and if any one question the moral grandeur which this sentiment may attain, let him call to mind the example of it, which, just before the victory of Trafalgar, was given by Nelson in the simple and sublime communication to his fleet—"England expects every man to do his duty!" Which is the instance that equals this, even in the forged records of Roman glory! Happily, too, the excess of hatred is as little known to the Englishman as excess of love; and revenge is abhorrent to his nature. Even in the pugilistic combat he shakes hands with his antagonist before he begins; he scorns to strike him when he is down; and, whether vanquished or victor, he leaves his antagonist neither cast down nor triumphant. The extraordinary value of such a character is obvious enough. British liberty and British commerce are its results: neither the Scottish nor Irish mind would have attained them.'

In this sketch, though clever and forcible, some conspicuous features of the social character of the English are overlooked. The domesticity of the Englishman's mode of life is very remarkable, when taken in contrast with the lounging, open-air existence of continental nations. The Englishman delights in his home, and spends much of his time in it—a result to which the nature of the climate undoubtedly contributes. He appreciates his home very highly, calls his house his castle, and prides himself on its being inviolable even by the emissaries of the law. The members of his family, his wife, his sons and daughters, are taken along by him in most of his recreations and pleasures. The conjugal tie is deemed peculiarly sacred, inasmuch that the slightest dishonour offered to it is universally resented. It cannot be said, however, that the affections of kindred are much recognised in England beyond the nearest class of relations. In all personal and domestic circumstances, the substantial is kept strongly in view, even while the ostensible object is ornament. The aristocratic institutions of the country have mixed, with the sturdy independence of the English character, a considerable reverence for external and accidental distinctions, and created a disposition, pervading almost all classes, to hold forth appearances rather above than below their means. For the same reason, as well as that abstract truths are not readily apprehended by the English intellect, there is a strong and general disposition to cling to ancient practices and forms in both government and law.

The population of England in the time of the Plantagenet sovereigns is believed to have been little more than two millions. It has been estimated at 5,500,000

## ENGLAND AND WALES.

in 1696. The progress during the greater part of the eighteenth century was slow; the amount in 1760 is supposed to have been about 6,500,000. In 1801, for the first time, a regular census was taken; and this has been repeated once in ten years ever since, giving the following results:—

<table style="width: 100%; border-collapse: collapse;"> <tr> <td style="width: 33%;">1801, - - 8,872,990</td> <td style="width: 33%;">1831, - - 13,894,569</td> </tr> <tr> <td>1811, - - 10,163,876</td> <td>1841, - - 15,908,741</td> </tr> <tr> <td>1821, - - 11,978,878</td> <td></td> </tr> </table>	1801, - - 8,872,990	1831, - - 13,894,569	1811, - - 10,163,876	1841, - - 15,908,741	1821, - - 11,978,878		
1801, - - 8,872,990	1831, - - 13,894,569						
1811, - - 10,163,876	1841, - - 15,908,741						
1821, - - 11,978,878							

The rapid advance of our population is placed in a striking light, when we consider that, for the United Kingdom, it is nearly a thousand per day. Within the last fifteen years, emigration has been proceeding on a scale of unprecedented magnitude; yet, even in the years during which it has been most active, it has not been sufficient to drain the country at one-third of the rate at which its population has been increased by new births. This rapid increase of numbers clearly shows that, whatever partial evils there may be in the condition of the people, the country must upon the whole have enjoyed, for nearly fifty years, a high degree of prosperity; for it is quite insupportable that, with stationary resources, so many new mouths could have been fed, unless there had been, what certainly there has not been, a large and general deterioration in the style of living. It is to be remarked, however, that an immigration to a great extent from Ireland has been going on for upwards of twenty years, and that generally the Irish settlers continue in England to live in a style little superior to that which they followed in their own country. The increased population has chiefly taken place in the manufacturing towns. It is calculated, indeed, by Mr Macculloch, that nearly a third of the people live in towns of above 10,000 inhabitants. Most of the large cities have experienced a rapid advance of population within the last twenty years. 'It appears that, while during the ten years ending with 1840, the entire population increased at the rate of 14·4 per cent., that of the great towns increased at the rate of 20·2 per cent. But if we compare the population of 1831 with that of 1841—deducting the population of the great towns as given above at each of these periods—the ratio of the increase of the rural population, including the smaller class of towns, will be found to be 11·2 per cent., or 9 per cent. under the increase of the great towns.' These facts serve to show that it is the development of the manufacturing, and not of the agricultural energies of the country, which has mainly tended to augment the population. [For further details respecting population and vital statistics, see No. 62, p. 191.]

### NATIONAL INDUSTRY.

In point of national industry England stands unrivalled by any other country on the globe. Her agriculture, though still more antiquated and less systematic than that of Scotland, has recently made rapid improvement; and, under different methods of lease, would soon attain a perfection worthy of her other industrial pursuits. As it is, about a third of the surface is under average cultivation, yielding profitably the ordinary white and green crops; a large proportion under first-rate pasture for fattening and dairy purposes; and a considerable extent under nursery, fruit and kitchen gardens, and pleasure-grounds. Altogether, the total agricultural produce of England—grain, green crops, live stock, dairy and other produce—cannot fall little short of £140,000,000. Assuming the entire area of England and Wales to be equal to 37,094,400 statute acres, it is estimated that 11,143,370 consist of arable fields and gardens; 17,605,630 of meadows, pastures, and marshes; 3,984,000 wastes capable of improvement; and 4,361,400 incapable of improvement. The fisheries carried on along the coasts of England can scarcely be regarded as one of the great sources of national wealth, although, on an average, they give employment, at sea and on shore, to no fewer than 14,000 hands.

In mining industry this section of Britain has long stood unrivalled. The operations, particularly in coal, iron, copper, tin, lead, and rock-salt, are conducted upon the most extensive and efficient systems; and the produce so obtained constitutes not only an important source of national riches, but has contributed in a marked degree to the advancement of the other arts and manufactures. The annual mineral produce for the last five or six years has been estimated as follows:—About £10,000,000 from coals; £8,600,000 from iron; £1,200,000 from copper; £920,000 from lead; £400,000 from salt; £390,000 from tin; £60,000 from manganese; £85,000 from silver; £22,000 from alum; £8000 from zinc; £25,000 from the other metals—as antimony, bismuth, arsenic, &c.; not taking into account the value of the rocks used in building, paving, and the like, nor the clay and sand used in the fabrication of pottery, glass, bricks, tiles, &c.

With regard to the arts and manufactures, there is scarcely a branch which is not less or more attempted: we can only enumerate the leading departments:—1. *Soft fabrics*, as cotton, valued at £30,000,000 annually; woollens, as cloths, carpets, hosiery, &c. about one-fifth less; silk, at £12,000,000; linen employs about 17,000 hands; lace, gloves, straw-plait, &c. unknown; paper, £1,500,000; leather manufactures, £18,000,000; hats, £2,800,000. 2. *Hardware*, comprising all kinds of articles, 'from the anchor of a man-of-war to the most delicate furniture of a lady's work-box.' Under this head rank steam-engines, general machinery, clocks and watches, cutlery and tools, jewellery and plate; and some idea of their value may be formed from the fact, that the annual produce in clocks and watches alone amounts to £17,000,000. 3. *Chemical and fictile manufactures*, the chief of which are—glass, amounting in annual value to £2,000,000; china and earthenware to £2,300,000; soap, alkalies, dyes, &c. 4. *Distilling, brewing, baking*, and other alimentary preparations. 5. *Ship-building* in wood and iron, and the allied arts of masonry, joinery, &c.

The commerce of England is fully commensurate with her manufacturing greatness; every sea is traversed by her vessels, every land visited in search of new markets and new objects of merchandise. Her merchant navy, with that of the Channel Islands and Man, exceeds 16,000 vessels, with an aggregate tonnage of 2,000,000, and carry upwards of 110,000 men. In 1843 there were 546 steam-vessels belonging to England, with an estimated tonnage of 72,024. The internal communication of the country is carried on by means of 26,000 miles of well-macadamised turnpike-roads, which traverse it in every direction; by canals, making an aggregate length of 2200 miles; and by railways, of which upwards of 4000 miles have been already laid down, or are in course of completion. The value of railway investments in Great Britain have been estimated at £200,000,000; mining companies, £10,000,000; gas companies, £6,415,295; and assurance companies, at £6,000,000.

### GOVERNMENT—ADMINISTRATION.

Respecting the political constitution, laws, religion, and education of England, the reader is referred to our article on the CONSTITUTION AND RESOURCES OF THE BRITISH EMPIRE, in which he will find those statistics and details, any notice of which in this place would lead only to unnecessary repetition, at the expense of matter which cannot be elsewhere adverted to.

For administrative purposes, the country is divided into fifty-two counties, forty of which form England proper, and twelve belong to Wales. Most of these are subdivided into hundreds; some into wards; York into ridings and wapentakes; Kent into lathes; and Sussex into rapes, which are again divided into hundreds. Judicially, the whole form 7 circuits; municipally, 25 cities and 172 boroughs; and ecclesiastically, 11,077 parishes. In the following table the counties are arranged alphabetically, with their areas, their population according to the census of 1841, and the

CHAMBERS'S INFORMATION FOR THE PEOPLE.

chief or county town; which, however, is not always the largest or most populous:—

Counties.	Acres.	Population.	Chief Towns.
Anglesea, . . .	173,440	50,891	Beaumaris.
Bedford, . . .	296,390	107,936	Bedford.
Berks, . . .	481,280	161,147	Reading.
Brecknock, . . .	482,560	55,603	Brecon.
Buckingham, . . .	472,320	155,963	Buckingham.
Caermarthen, . . .	623,360	106,326	Caermarthen.

Note.—England derives its name from the *Angles*, one of the Saxon tribes who settled in its southern districts about the middle of the fifteenth century. As might be expected from its history, its topographical nomenclature is a compound of British, Roman, Saxon, and Norman. The following prefixes and affixes are of frequent occurrence:—*Ton*, town; *borough*, or *bury*, town; *ville*, town; *by* or *by*, habitation; *ham*, home or dwelling; *stock* or *stow*, residence; *thorpe*, a number of dwellings or village; *caer*, fort or castle; *castr* or *chester*, fortified camp; *minster*, abbey or church; *lan*, place of meeting or church; *eccles*, church; *hith*, port; *don* or *dun*, hill; *pen*, height; *ness*, promontory; *ley* or *leigh*, meadow plain; *burn*, stream or boundary; *abey*, confluence or mouth of a river; *ford*, shallow passage; *wick*, *with*, bend of a river, or dwelling by.

REMARKABLE SCENERY.—NATURAL CURIOSITIES.

**Lake Scenery.**—The south-west part of the county of Cumberland and the north-west part of Westmoreland comprehend a range of lofty mountains—Skiddaw, Saddleback, Helvellyn, and some others of scarcely less note—amidst which lie the lakes for which this district of England has long been celebrated. The largest of these are Ulleswater, Thirlmere, Derwentwater, and Bassenthwaite; but some of less size—as Buttermere, Crummockwater, Loweswater, Ennerdale, Wastwater, and Devoek Lake—are scarcely less admired. The vales or passes amongst the hills likewise contain much beautiful scenery of a wild character, although perhaps only traversed by a brawling mountain rill. As already

mentioned, it is the combination of alpine wildness and grandeur, with the soft scenery which reposes in clothed slope and mirror-like lake at the bottoms of the hills, that gives the Cumberland scenery its principal charm. Ulleswater, which extends into Westmoreland, is thought to possess the greatest beauty: it is about 9 miles in length, but nowhere more than 1 in breadth. Derwentwater (often termed Keswick Lake, from its vicinity to the town of Keswick), which measures 3 miles in length by 1½ in breadth, is only inferior to Ulleswater. Mrs Radcliffe, the eminent novelist, describes it as having peculiar charms, both from beauty and wildness. 'The whole is seen at one glance, expanding within an amphitheatre of mountains, rocky but not vast, broken into many fantastic shapes. The precipices seldom overhang the water, but are ranged at some distance; and the shores swell with woody eminences, or sink into green pastoral margins. The bosom of the lake is studded by several small but well-wooded islands.'

Amongst the *passes*, that of Borrowdale is the most remarkable: it is a narrow chasm opening from the centre of the amphitheatre which terminates the expanse of Derwentwater, and traversed by the vehement little stream of the same name. Near the entrance of the pass is a detached mountain called Castle-Crag, with a peaceful village reposing at its foot; and opposite to Castle-Crag is the *Bowderstone*, a huge mass of rock, which has apparently fallen from the neighbouring cliffs, and round whose base the road is made to wind. It is computed that this enormous boulder is not less than 1800 tons in weight.

The lake scenery of Cumberland has by its beauty attracted a great number of permanent residents, whose villas enter pleasingly into its landscapes, and amongst whom the present age has seen several eminent literary men—Southey, Wordsworth, &c. It also attracts an immense number of tourists from all parts of the kingdom. The district usually called the *Lakes* may be said also to comprehend a small northern and nearly detached portion of Lancashire, where Windermere and Coniston Water are sheets rivalling in extent and beauty those of Cumberland.

**Derbyshire Peak Somery.**—The termination of the great northern range in the north of Derbyshire, presents in that district a collection of rugged hills and narrow valleys, amidst which some of the most romantic scenery in England is to be found. A particular portion of it, near the village of Castleton, is termed the Peak Scenery, from a particular eminence or peak which attracts more than usual attention.

The Peak is approached through a rude and savage pass named *Winyats* (*q. d. gates of the winds*), flanked with precipices 1000 feet high. It is a limestone mountain, and perforated, as mountains of that kind of rock often are, with an immense cave. On the top are perched the remains of a castle, once the residence of a family descended from William Peveril, a natural son of the Conqueror. In the precipice below, above 600 feet from the top, is the entrance of the cave, a flattish Gothic arch, 120 feet wide and 46 in height. Within this arch the cavern recedes about 90 feet. Here a company of twine-makers pursue their humble trade. At the extremity of the first cave, which alone enjoys any of the light of day, a low and narrow arch leads into a spacious opening called 'The Bell-house,' whence a path leads to the 'First Water.' This is a lake 42 feet in breadth, passing below a massive arch of rocks, in some places not more than 20 inches above the surface of the water. Laying himself flat along the bottom of a small canoe, the visitor with his guide shoots through below the depending rocks into an opening 220 feet in length, 200 in breadth, and 121 in height. At the farther extremity of this spacious cavern, the stream which flows along the bottom forms itself into what is called the 'Second Water,' near the end of which is a pile of rocks subjected to a perpetual copious dripping from the roof, and called 'Roger Rain's House.' Other passages and expansions succeed, till the cave ceases to

be passable at the distance of 2300 feet from the opening. On returning from his torch-lit adventure to the mouth of the cave, the visitor usually experiences a singular impression of novelty and delight from beholding again the surface of the daylight world.

The scenery adjacent to the neighbouring town of Buxton is also much celebrated. One of the most noted objects is *Elden's Hole*, a perpendicular opening, down which a line has been dropped to the extent of 2652 feet without finding the bottom. *Poole's Hole* is a cave remarkable for its magnificent stalactites. A succession of beautiful valleys, situated amidst rugged mountains, leads to the romantic one of *Mallock*, where the banks of the Derwent are bordered by extensive woods, interspersed with the boldest and most varied forms of rock. Of a wilder character is the celebrated *Doodale*, where the River Dove traverses a pass of 2 miles in length, and of the most striking character. The sides of this short valley are chiefly composed of rocks of gray limestone, which, in their abrupt and towering ascent, assume innumerable fantastic forms—spires, pyramids, &c.—and are clothed with yew-trees, the mountain ash, and numerous mosses and lichens.

The *Isle of Wight*, situated off the coast of Hampshire, and measuring 23 miles by about 13, is celebrated both for its mild climate and its beautiful scenery. From the high open downs formed by a range of chalk hills in its centre, some delightful views, mingling the bold objects of the coast line with the sail-studded English Channel, are obtained. The south shore is the most noted for its romantic objects, the most remarkable of which is at *Undercliff*. Here a great chalk cliff has at one time been presented to the sea; but, afterwards undermined by the action of the waves, a large portion of it has fallen forward in vast fragments, leaving a new cliff at the distance of about half a mile from the shore. In the interval between the beach and the cliff, the fragments are scattered in confusion, many of them forming eminences of the most picturesque forms, while the intermediate spaces afford room for cottages and villas, and even at one place for a small rising town, nestling amidst the most beautiful shrubbery, natural and artificial. This district, when viewed from the sea, appears a series of gigantic steps, rising from the beach towards a great perpendicular wall. The cliff in several places opens in vast ravines, locally termed *obines*, which are usually clothed with a picturesque vegetation, and the most admired of which are those of Shanklin and Blackgang. Newport, the capital, is situated in a beautiful valley in the interior, adjoining the picturesque old castle of Carisbrooke. At the western extremity of the island are the celebrated *Needles*, a cluster of chalk rocks raising their splintery and rugged peaks high above the waters which rush and roll in the dangerous passages that lie between.

*Scenery of Wales and Cornwall.*—Wales has already been described as a mountainous region, the chief peaks of which somewhat exceed 3000 feet in height. It is visited by tourists from all parts of the kingdom, on account of the picturesque scenery with which it abounds, particularly in the northern district, or *North Wales*. Its hollows or vales contain none of those beautiful expanses of water which mix such softness with the grandeur of the Cumbrian scenery, but are traversed by impetuous rivers and torrents, according with the precipitous and savage character of the landscape. The vales of North Wales are deeper and narrower than those of South Wales; these expand in many instances into broad plains, affording scope for the operations of the agriculturist, and for the building of towns and villages.

A range of hills, of which *Snowdon* is the highest, traverses North Wales from south to north, terminating at Beaumaris Bay in the tremendous steep of *Pennantmawr*, whose hanging fragments threaten to bury him who travels by the difficult path which has been formed along its almost perpendicular sides. This hilly district comprehends a few *turns*, or mountain lakelets, full of delicious fish. The general bleakness

is delightfully relieved by the intervening vales, the largest of which is that of Clwyd in Denbighshire, 20 miles long by about 4 or 5 in breadth, and presenting a brilliant picture of fertility. Amongst the lesser vales, the most famed for beauty is that of *Llan-gollen*, 'where the Dee, winding through cultivated and pastoral scenes, presents at every step a varying landscape.' *Festiniog*, in which a number of streams unite to form a little river, amidst verdant and wooded scenes, is also celebrated by tourists.

Upon a hill north of Liskeard in Cornwall, the slopes of which are strewn with granite boulders, stands the curious pile called the *Cheese Wring*, composed of five flat round pieces of the same rock, laid one above another, the largest towards the top, so that the whole forms a kind of inverted cone, to the height of 15 feet. Dr Macculloch, the eminent geologist, explains the formation of this strange object as solely owing to natural causes. *Logging Stones*, of which there are several in the same county, are in like manner explained. The largest is one situated upon a cliffy promontory near the Land's End. It is a mass 17 feet in length, of irregular form, and believed to be about 90 tons in weight, resting by a slight protuberance upon the upper surface of the cliff, and so nicely poised, that a push from the hand, or even the force of the wind, causes it to vibrate. It appears that these logging stones are simply prismatic masses of the rock, which have been left in their present situation after adjoining masses of a similar character had been removed.

#### ANTIQUITIES, &c.

Perhaps the earliest objects of antiquity in England are the barrows or *tumuli* with which the Britons, like so many other uncivilized nations, were accustomed to cover the remains of the dead. Several specimens of these still exist, but many more have been destroyed and levelled with the soil. Their construction, contents, and other peculiarities are appropriately noticed under *ARCHÆOLOGY* in No. 98.

*Druidical Remains* rank perhaps next in point of antiquity. The most simple of these are *Cromlechs*, of which an unusual number is found in the island of Anglesea, once the chief seat of the Druids, who were the priests of British heathenism. A cromlech consists of a large slab of stone, placed flatwise, or in a sloping position, upon two upright ones. It seems to have formed an altar for human sacrifices. *Druidical circles* are more complicated. They usually consist of circles of huge stones placed on end, with in some instances connected lines or rows of similar stones, the whole forming objects at once rude and imposing. It is believed that they were the temples of the Druids. The most remarkable Druidical circle is that of *Abury*, six miles from Marlborough in Wiltshire: there is an outer circle, 1400 feet in diameter, composed of stones generally about 16 feet in height, with a distance of 27 between every two. There are small concentric circles within the large one, and in the centre of all is a cromlech or altar for human sacrifices, composed of one long flat stone, supported by two upright ones. Two straight avenues of approach, about a mile in length, were composed of similar blocks, and on the outside of the outermost circle there was a *vallum* or bank, the inner slope of which was perhaps a place for spectators. From the encroachments and carelessness of the neighbouring inhabitants during a long course of ages, this curious relic of the British people is much dilapidated. Another Druidical circle of great note is that of *Stonehenge* upon Salisbury Plain, a district also presenting many tumuli and other vestiges of the Britons. The Stonehenge temple, in its perfection, consisted of 140 stones, arranged in two concentric circles, the outermost 108 feet in diameter, with similar stones laid flatwise along the tops of the upright stones. The blocks which remain are from 18 to 20 feet high, and about 7 feet broad. Within the inner circle are two oval ranges, supposed to have formed the *admytum* or cell, and which consist of stones about 80 feet in height. The remains of this

stupendous temple, fragments as they are, still produce a sensation of awe upon the mind of the beholder.

*Roman Remains* are now rare, and nearly obliterated. The roads formed by this people have in some instances been changed into our present comparatively broad and well-formed ways; in other cases, slight traces of their original pavement, which generally consisted of large stones forming a causeway, are to be found. Between Newcastle and Carlisle are the remains of the two walls built respectively by the Emperors Adrian and Severus, in 120 and 210, to keep out the northern barbarians: the first being a high mound of earth, and the second a rampart of stone, 68½ miles long, running parallel to the first. All the towns, the names of which terminate in *chester* or *cester*, are considered as having been originally Roman stations. Near St Albans are the remains of the walls which once surrounded the Roman town of *Verulamium*, the site of the town itself having long been subjected to the plough. In making excavations in London and other places, remains of Roman buildings—temples, baths, &c.—are frequently brought to light, proving, contrary to an affected notion now somewhat prevalent, that Roman civilisation had made considerable progress in our island.

Several of the small churches built soon after the introduction of Christianity still exist, and continue to be used as parish churches. The larger churches connected with monastic establishments, and the cathedrals, which were the seats of bishops, took their rise at a later period, chiefly during the twelfth and thirteenth centuries. This was a time when an enthusiasm existed for founding and endowing monasteries and churches. To it we are indebted for many superb ministers, the solemn beauty of which continues to be a proud possession of our land. Westminster Abbey, York Minster, and the cathedrals of Winchester, Lincoln, Gloucester, Canterbury, Lichfield, and Salisbury, may be instanced as particularly august specimens of the Gothic style in which all ecclesiastical structures were then built. There are also many ruinous remains of the great abbacies of the middle ages: those of Tintern, near Monmouth; Glastonbury, near Wells; and Bury St Edmund's, are of famed beauty. A kindred class of structures exist in what are called *crosses*, which consist generally of an elegant tapering Gothic erection, with a small shrine below, and were in most instances erected to hallow the spot on which the remains of venerated persons rested on their way to the tomb.

Of the huge castles built by the Norman nobility and by the sovereigns during the first few centuries after the Conquest, many specimens still exist, but few which are not in ruins. The Tower of London, built by the Conqueror himself, is an entire and most superb example of this class of structures. Conway and Caernarvon Castles, which, with several others, were raised to overawe the then independent principality of Wales, are also noble specimens. Others may be found in the north—as Lancaster, Carlisle, Newcastle, and Rugby. They usually consist of a great square tower, with ranges of lesser towers, and the whole surrounded by thick and lofty walls, beneath which there was generally a moat or wet ditch. Dover Castle, placed on a lofty cliff overlooking the English Channel, and still kept in good order, is a peculiarly interesting specimen of the Norman fortress.

England abounds in mansions in various styles, the seats of her nobility and gentry. Some of these reach a high degree of splendour, both in architecture and internal furnishing, not to speak of the delightful sylvan domains by which they are generally surrounded.

#### CITIES—TOWNS—PORTS.

It has already been seen that a large part of the population of England is collected in cities and towns of considerable size. Some of these may be classed under the separate heads of manufacturing and commercial towns, while others are either university towns, naval stations, cathedral towns, or towns for summer recreation or the residence of persons in independent

circumstances. The cities and towns of England are of great number, and though often of plain exterior, include an immense amount of wealth. The prevalence of brick in domestic buildings, and of the smoke arising from coal fires, give a peculiar character to English towns. In all, however, there are numerous churches and other public edifices, and in some there are many streets built entirely of stone:—

#### The Metropolis.

*London*, the capital of England, and metropolis of the British Empire, is situated on the banks of the Thames, in the counties of Middlesex and Surrey. On the spot now occupied by *the city*, or more ancient part of the metropolis, which is on the left or northern bank of the Thames, a town had been built and possessed by the Romans eighteen centuries ago, and from that period it has constantly been the seat of an increasing and busy population. Its chief increase and improvement, however, have been since the great fire in 1666, which destroyed a large number of the old streets and public edifices. The original city was fortified by a wall, which has long since been removed, to allow of an expansion into the adjacent fields; and as the number of houses and streets without the old line of wall has at length greatly exceeded those within, *the city* is like a mere kernel in the mass. The extending city has in time formed a connection with various clusters of population in the neighbourhood, including Westminster on the west, and by means of bridges, Southwark and Lambeth on the south. The whole metropolis, reckoning by continuous lines of houses, extends to a length of nearly 8 miles, by a breadth of from 6 to 7; and it is computed that the whole includes at least 36 square miles!

The following is the list of districts included within what is usually described as London, with their population in 1831:—London within the walls, 57,695; London without the walls, 67,878; city of Westminster, 202,080; out-parishes within the bills of mortality, 761,348; parishes not within the bills of mortality, 298,567; Southwark, 91,501: total, 1,474,069. London within the walls contains ninety-eight parishes, most of which are very small in size, but at one time were very populous. The practice of living out of town, and of using the dwellings of the city for warehouses, has greatly lessened the population in latter times. Without the walls, there are eleven parishes, independently of the parishes in Westminster and Southwark. The largest and most populous of the suburban parishes is Marylebone. Adjoining the suburban, though really town parishes, there are various country parishes, as Greenwich, Deptford, Camberwell, Clapham, Westham and Stratford, Hammersmith, Hampstead, &c., containing an aggregate population of 129,480; and adding this number to the above 1,474,069, there was within a compass of about eight miles round London, in 1831, a population of 1,584,042, which in 1841 had increased to 1,873,676, and which now probably exceeds 2,000,000. Within the last fifty years, London has doubled in extent, and at present is rapidly increasing on all sides, particularly on the north, west, and south. Of the population in 1841, 168,000 were domestic servants; 28,000 boot and shoemakers; 28,000 tailors; 21,000 dressmakers and milliners; 20,000 clerks; 18,000 carpenters and joiners; 16,000 laundry-keepers, washers, and manglers; 13,000 porters, messenger and errand boys; 11,000 painters, plumbers, and glaziers; 8000 cabinetmakers and upholsterers; 6600 bricklayers; 6000 butchers; 6600 printers; 7000 seamen; 5000 grocers and tea-dealers; 9000 bakers; 6700 blacksmiths; 5400 booksellers, binders, and publishers; 4000 engineer and engine-workers; 4500 tavern-keepers and victuallers; 3800 warehousemen and women; 3800 general merchants; and so on, showing the very miscellaneous nature of the trade upon which the metropolis depends.

The increase of London to its present enormous size, has been promoted by certain highly-favourable cir-

circumstances. First, it has for ages been the capital of England, and seat of the legislature and court; and since the union with Scotland and Ireland, it has become a centre also for these parts of the United Kingdom. Being, therefore, a point of attraction for the nobility, landed gentry, and other families of opulence from all quarters, a vast increase of population to minister to the tastes and wants of these classes has been the result. While deriving immense advantages from this centralising principle, London has been equally, if not far more, indebted to its excellent situation on the banks of a great navigable river, and in a fine part of the country. As already mentioned, London proper, or the greater part of the town, stands on the left bank of the Thames, on ground rising very gently towards the north; and so even and regular in outline, that among the streets, with few exceptions, the ground is almost flat. On the south bank of the river, the ground is quite level, rather too much so; and on all sides the country appears very little diversified with hills, or anything to interrupt the extension of the buildings. The Thames, that great source of wealth to the metropolis, is an object which generally excites a lively interest among strangers. It is a placid, majestic stream, rising in the interior of the country at the distance of 138 miles above London, and entering the sea on the east coast about 60 miles below it. It comes flowing between low, fertile, and village-clad banks, out of a richly-ornamented country on the west, and arriving at the outmost houses of the metropolis, a short way above Westminster Abbey; it pursues a winding course between banks thickly clad with dwelling-houses, warehouses, manufactories, and wharfs, for a space of eight or nine miles, its breadth being here from a third to a quarter of a mile. The tides affect it for fifteen or sixteen miles above the city; but the salt water comes no further than Gravesend, or thirty miles below it. However, such is the volume and depth of water, that vessels of seven or eight hundred tons reach the city on its eastern quarter at Wapping. The nett customhouse duty collected at the port in 1844 amounted to the amazing sum of £11,197,981, being fully one-half of the entire customs' duties of the United Kingdom!

London, from the want of stone in all the eastern districts of England, is essentially a *brick-built town*. To a stranger, it appears to consist of an interminable series of streets of moderate width, composed of dingy-red brick houses, which are commonly four storeys in height, and seldom less than three. The greater proportion of the dwellings are small. They are mere slips of buildings, containing in most instances only two small rooms on the floor, one behind the other, often with a wide door of communication between, and a wooden stair, with balustrades, from bottom to top of the house. It is only in the more fashionable districts of the town that the houses have sunk areas with railings; in all the business parts, they stand close upon the pavements, so that trade may be conducted with the utmost facility and convenience. Every street possesses a smooth flagged pavement at the sides for foot passengers; while the central parts of the thoroughfares are causewayed with square hard stones, or paved in some other way equally suited to endure the prodigious tear and wear created by the horses and vehicles passing along them. In the central and many other principal streets of London, the ground storeys of the houses are generally used as shops or warehouses. When the object is retail traffic, the whole range of front is usually formed into door and window, so as to show goods to the best advantage to the passengers. The exhibition of goods in the London shop-windows is one of the greatest wonders of the place. Everything which the appetite can desire, or the fancy imagine, would appear there to be congregated. In every other city there is an evident meagreness in the quantity and assortments; but here there is the most overwhelming abundance.

The flowing of the Thames from west to east through

the metropolis, has given a general direction to the lines of streets; the principal thoroughfares are in some measure parallel to the river, with the inferior, or at least shorter, streets branching from them. Intersecting the town lengthwise, or from east to west, are two great leading thoroughfares at a short distance from each other, but gradually diverging at their western extremity. It is a matter of general complaint that there are so few great channels of communication through London both lengthwise and crosswise; for the inferior streets, independently of their complex bearings, are much too narrow for regular traffic. According to the accounts last taken, the entire metropolis contained 13,936 separate streets, squares, courts, alleys, &c. each with a distinct name. Oxford Street, the longest in London, is 2304 yards in length, and numbers 225 houses on each side.

Without particular reference to municipal distinctions, London may be divided into four principal portions—the city, which is the centre, and where the greatest part of the business is conducted; the east end, in which is the port for shipping; the west end, or Westminster, in which are the palaces of the Queen and royal family, the Houses of Parliament, Westminster Abbey, and the residences of the nobility and gentry; the Surrey division, lying on the south side of the Thames, and containing many manufacturing establishments and dwellings of private families. Besides these, the northern suburbs, which include the once detached villages of Stoke-Newington, Islington, Hoxton, St Pancras, Pentonville, Somers' Town, and Paddington, and consist chiefly of private dwellings for the mercantile and higher classes, may be considered a peculiar and distinct division. It is, however, nowhere possible to say exactly where any one division begins or ends. Throughout the vast compass of the city and suburbs there is a blending of one division with those contiguous to it. In the business parts there are lines or clusters of neat dwellings, and in the parts devoted to retirement there are seen indications of business. The outskirts on all sides comprise long rows or groups of detached villas, with ornamental flower-plots; and houses of this attractive kind proceed in some directions so far out of town, that there seems no getting beyond them into the country. From the Surrey division there extend southwards and westwards a great number of these streets of neat private houses, as, for instance, towards Walworth, Kennington, Clapham, Brixton, &c.; and in these directions lie some of the most pleasant spots in the environs of the metropolis.

#### Manufacturing Towns.

At the head of these stands *Manchester*, the chief seat of the principal manufacture of England—that of cotton. This town is situated on the river Irwell, in the south-east district of Lancashire, at the distance of 182 miles from London. Inclusive of Salford, a separate municipality on the other side of the Irwell, and also comprehending a few connected villages, Manchester contained in 1831 a population of 227,808, and in 1841, 296,183. The ground on which the town stands is a perfect level, and from whatever side it is approached, its crowd of spires, towers, manufactories, and warehouses, appears mingling with the smoke that hangs over it. The older part of the town clusters round the collegiate church, an elegant and spacious structure of the time of Henry VII., or extends in the ancient street called Deansgate. The busiest commercial street is Market Street, and the most elegant is Mosley Street. The town contains most of the usual public buildings to be found in one of its size—a Town-Hall, infirmary, prison, Exchange, &c. besides several institutions of a literary and scientific character; and several of these buildings, particularly the two first, are of remarkable elegance. A botanic garden and public park in the outskirts of the town, are great ornaments, and form most delightful as well as instructive places of recreation.

The factories of Manchester exceed 160 in number: they employ between 85,000 and 45,000 persons, and steam enginery equal in power to 6000 horses. About four-fifths of the cotton manufacture of the kingdom centres in Lancashire, and of this a large proportion is confined to Manchester—there being in 1844 no fewer than 1724 cotton-mills, employing 197,460 hands. The woollen, linen, and silk trade, particularly the last, and many smaller manufactures, as of hats, pins, umbrellas, &c., are also carried on to a large extent in this town. It may be added, that the making of machinery has of late years become a thriving trade in the township. The town is also the centre of several railway lines, and by means of these, the Irwell, and numerous canals, it transports and receives goods to and from every part of the kingdom.

The above may be considered as an outline of this great seat of manufacturing and commercial industry. Fully to describe the bustle of wagons and human beings on its streets, to detail the vast mercantile transactions in which it is engaged, or describe its numerous factories and workshops of various kinds, would require a separate volume. In the way of details, we may transcribe a few paragraphs from a local work published a few years ago under the title of 'Manchester as it is':—

'Many of the mills are immense buildings, raised to the height of six, seven, and eight storeys, erected at an expense of many thousands of pounds, and filled with machinery costing as many more. The capital sunk in a single mill will sometimes be £50,000, and frequently is as much as £100,000. Some of the mills contain nearly 2000 hands. A visit to one of the largest mills, if an introduction can be procured, is a gratifying treat. The rooms are kept in the most perfect state of cleanliness, and the strictest order and regularity prevail. Every operation is performed by rule, and the subdivision of labour is carried out in the most minute manner. The mills and factories are of various sorts—namely, cotton spinning-mills, silk spinning-mills, woollen spinning-mills and factories, small-ware factories, and power-loom weaving factories.

Amongst the cotton-mills, one of extraordinary extent, belonging to Messrs Birley & Co., is situated in the suburb called Chorlton-upon-Medlock. It consists of a group of buildings, upon which, including machinery, several hundred thousand pounds have been sunk. The number of hands employed by this firm is 1600, whose wages annually amount to the sum of £40,000. The amount of moving power is equivalent to the labour of 397 horses. The number of spindles in the mills is about 80,000. The annual consumption of raw cotton is about 4,000,000 lbs. weight! One room alone contains upwards of 600 power-looms. In the establishments called small-ware mills, the articles of cotton, worsted, and silk tapes, are very extensively manufactured. Some idea of the extent to which tape manufacture is carried on in Manchester, may be formed from the fact, that at the works of Messrs Wood and Westheads, upwards of 1,240,000 yards of goods, not exceeding three inches in width, and composed partly or entirely of cotton, linen, silk, or worsted, are woven in *one week*, or upwards of 35,227 miles in *one year*!

One of the principal works in the department of steam-engine making and engineering, is that belonging to William Fairbairn, Esq., situate in Canal Street, Great Ancoats Street. In this establishment the *heaviest* description of machinery is manufactured, including steam-engines, water-wheels, locomotive-engines, and mill-gearing. There are from 550 to 650 hands employed in the various departments; and a walk through the extensive premises, in which this great number of men are busily at work, affords a specimen of industry, and an example of practical science, which can scarcely be surpassed. In every direction of the works the utmost *system* prevails, and each mechanic appears to have his peculiar description of work assigned, with the utmost economical subdivision of labour. All is activity, yet without confusion. Smiths, strikers, moulders,

millwrights, mechanics, boiler-makers, pattern-makers, appear to attend to their respective employments with as much regularity as the working of the machinery they assist to construct.

In one department mechanics are employed in building those mighty machines which have augmented so immensely the manufacturing interests of Great Britain—namely, steam-engines. All sizes and dimensions are frequently under hand, from the diminutive size of 8 horses' power, to the enormous magnitude of 400 horses' power. One of this latter size contains the vast amount of 200 tons or upwards of metal, and is worth, in round numbers, from £5000 to £6000. This extensive concern forwards its manufactures to all parts of the world. The stranger is told, on inquiry, that *this* article is for Calcutta, *that* for the West Indies; this for St Petersburg, that for New South Wales; and there are, besides, men belonging to it *located* in various parts of Europe, who are employed, under the direction of Mr Fairbairn, in superintending the erection of work manufactured on these premises.'

Leeds, the chief town for the manufacture of cloths, is situated in the West Riding of Yorkshire, on a slope gently rising from the River Aire, at a distance of 189 miles from London, with which, as well as with the chief towns of the kingdom, it is now connected by railway. It contains a few streets of handsome houses; but as in many other English manufacturing towns, utility appears to be more in contemplation than ornament or elegance. The population in 1831 was 123,393; in 1841, 151,063. There are some goodly public structures, as a court-house, commercial buildings, theatre, &c., and the town enjoys the benefits of a literary and philosophical society, an institution for the promotion of the fine arts, and several public libraries.

Leeds is the centre of a large district devoted to the making of mixed and white cloths. Cloths of light fabric, and blankets and carpets, are also made here in considerable quantity; but the mixed and white cloths form the staple of the business of the district. The mode in which these are sold in Leeds, gives occasion for the existence of two public buildings of a most peculiar nature. They are called respectively the Mixed Cloth Hall and the White Cloth Hall. A description of the former, from a popular work, will convey an idea of both:—'The Mixed Cloth Hall was erected in 1758, at the general expense of the merchants. It is a quadrangular edifice, surrounding a large open area, from which it receives the light abundantly, by a great number of lofty windows; it is 128 yards in length and 66 in breadth, divided in the interior into six departments, or covered streets, each including two rows of stands, amounting in number to 1800, held as freehold property by various manufacturers, every stand being marked with the name of the proprietor. This hall is exclusively appropriated to the use of persons who have served a regular apprenticeship to the trade or mystery of making coloured cloths. The markets are held on Tuesdays and Saturdays, and only for an hour and a-half each day, at which period alone sales can take place. The market-bell rings at six o'clock in the morning in summer, and at seven in winter, when the markets are speedily filled, the benches covered with cloth, and the proprietors respectively take their stands: the bell ceasing, the buyers enter, and proceed with secrecy, silence, and expedition, to bargain for the cloth they may require, and business is thus summarily transacted, often involving an exchange of property to a vast amount. When the time for selling is terminated, the bell again rings, and any merchant staying in the hall after it has ceased, becomes liable to a penalty. The hall is under the management of fifteen trustees, who hold their meetings in an octagonal building, erected near the entrance to this hall.'

Huddersfield, with a population of 25,000, Wakefield (18,000), Saddleworth (17,000), Halifax (20,000), and Bradford (34,000), all in Yorkshire, and Rookdale (67,000) in Lancashire, are other towns noted for their

concern in the cloth manufacture, but of inferior population, and not distinguished by any remarkable features. *Aminster* (3,000), *Kiddminster* (14,000), *Ashton*, and *Willon*, are the chief seats of the carpet manufacture. *Bradford* in Wiltshire, is distinguished for superfine cloths.

*Birmingham*, the chief town in the kingdom engaged in metallic manufactures, is situated in Warwickshire, at the distance of 169 miles from London. The lower part of the town consists chiefly of old buildings, is crowded with workshops and warehouses, and is inhabited principally by manufacturers; but the upper part has a superior appearance, consisting of new and regular streets, and containing a number of elegant buildings. Amongst the public buildings, the Town-Hall calls for particular notice, being a magnificent structure of the Corinthian order, in the proportions of the temple of Jupiter Stator at Rome. The population of Birmingham in 1831 was 146,986; in 1841, 181,186; being nearly all engaged in trade and manufactures.

Amongst the principal manufactures are buttons in immense variety, buckles, cloak-pins, and snuff-boxes; toys, trinkets, and jewellery; polished steel watch-chains, corkscrews, &c.; plated goods for the dining and tea-table, now in the way of being superseded by similar goods of mixed metal; japanned and enamelled articles; brass-work of every description; swords and fire-arms; medals and coins of various kinds; copying machines and pneumatic apparatus; grates, fire-irons, gas-light burners, nails, and steel-pens. Besides almost every metallic article which can be considered as curious, useful, or ornamental, cut crystal is produced to a large extent, while certain branches of the cotton trade connected with hardware, as the making of the cloth for umbrellas, braces, girths, and the like, have also fixed themselves here, in order to facilitate the preparation of these articles.

The operations of the Birmingham manufacturers are carried on chiefly by means of foundries, rolling-mills, die-stamping machines, and turning-lathes. From the foundries proceed all heavy iron goods, and even a considerable quantity of small wares, though the work required in trimming these articles after they leave the sand, causes a constant tendency towards the use of the die-stamp in preference. By the latter machine, not only are buttons and other small articles produced, but likewise complicated decorative articles of many various kinds, to which it might be supposed that the process was inapplicable. The rolling-mill is a ponderous engine for pressing out ingots of metal into sheets of requisite thinness. The lathe, a conspicuous machine in the workshops of Birmingham, is used for the preparation of articles of correctly circular, and also of oval form. It is usually driven by steam; and in many instances this power is not generated in the premises of those who use it, but is obtained upon rental from some steam-engine kept by a different individual in the neighbourhood.

To give an idea of the extent of some branches of trade, and the activity of some kinds of machinery at Birmingham, it may be stated that at the pin-works, some years ago, 12,000 pins could be cut and pointed, and 50,000 pin-heads made from the wire, in an hour; that there is a coining-mill which produces between 30,000 and 40,000 pieces of coin in the same time; and that from 1805 to 1818, 5,000,000 stands of arms were made for public and private service. The making of steel-pens, which, before 1821, was scarcely known, is now a great manufacture. Probably not less than 10,000,000 are made annually. There is one individual in the trade who employs 250 persons, and consumes every year upwards of forty tons of metal. The article was originally sold at the rate of one shilling each pen; and now, from improvements and facilities in the manufacture, 144 are sold at the same money.

*Sheffield*, in the West Riding of Yorkshire, ranks only second to Birmingham as a seat of metallic manufactures. In 1841 it contained 109,597 inhabitants, great part of whom are engaged in the business for

which Sheffield is remarkable. The situation of the town, upon a swelling piece of ground near the confluence of the Sheaf and Don, gives it health and cleanliness; but only the newer streets and suburban villas are neat, and the town is constantly involved in the smoke arising from the manufactories. A music-hall, post-office, and medical hall, together with a building called the Cutlers' Hall, in which the members of that trade meet for an annual banquet, are the chief public buildings boasting of any elegance of exterior.

Sheffield was famous in the middle ages for producing knives and arrow-heads. From such small beginnings, it advanced in the course of ages to its present distinction. An immense quantity of knives, scissors, implements of husbandry, and surgical and mathematical instruments, is now made in it. The manufacture of plate, and of goods in imitation of it, as also of carpenters' tools, printing types, haircloth, and many other articles, is carried on to an immense extent. The manufactures of Sheffield have the peculiarity of being chiefly in the hands of men of moderate capital and limited business, though there are also a few houses which engross a vast quantity of the principal trade. The establishments for the grinding and polishing of cutlery are among the most striking objects of curiosity to a stranger; and the show-room of the Messrs Rogers, cutlers to her Majesty, is a splendid museum, where all the local manufactures may be seen, of the best quality, and in the finest order.

*Coventry*, an ancient city in Warwickshire, 91 miles from London, is a great seat of the manufacture of ribbons, and also of watches. Some other manufactures, carried on to a great extent in the last century, including gauzes and calimancoes, have declined, leaving the above alone flourishing. The population in 1831 was 27,070; in 1841, 30,179; all except a small portion being engaged in trade and manufactures.

Coventry is an ancient town of note, and contains, besides some good modern public buildings, an old church of remarkable beauty as a specimen of Gothic architecture, and a very curious old hall (St Mary's Hall), used for festive purposes, having a grotesquely-carved oak roof, and a piece of tapestry, wrought in 1450, measuring 80 feet by 10, and containing 80 figures. The town was remarkable in early ages for the performance of the grotesque religious dramas called Mysteries, and for the shows and pageants which took place in celebration of the visits of royal personages. One pageant of an extraordinary character has been performed annually ever since the reign of Charles II. It is designed to commemorate a real or imaginary incident, which is thus related:—Leofric, Earl of Mercia, who possessed the property of the tolls and services of Coventry, exacted his dues so rigidly, that the inhabitants were greatly aggrieved, and at length Godiva, his pious wife, became their advocate. The earl, wearied by her solicitations, promised to grant her request, if she would ride naked through the town at mid-day. His terms, according to the legend, were accepted, and the countess rode through the town with no covering but her flowing tresses. It is added, that she had modestly commanded every person to keep within doors and away from the windows, on pain of death; but that one person could not forbear taking a glance, and lost his life for his curiosity. The procession commemorative of this occurrence includes the whole of the officials of the corporation, besides a female of easy purchase, who rides in a dress of linen, closely fitted to her limbs, and coloured like them. The curious person who stole the glance is called *Peeping Tom*, and a wooden image of him is to be seen on a house in the city.

*Derby*, the capital of Derbyshire, is an ancient, but now considerably modernised town, situated on a pleasant slope and irregular ground, on the south side of the vale of the Derwent, a river tributary to the Trent, pursuing a winding course through the county, and of great value in moving mill-machinery. Derby is the centre of one of the most productive and industrious districts in England, particularly as respects the manu-

facture of iron and other minerals. In the town and its neighbourhood there are large manufactories of lace, galloons, broad silks, silk hosiery, china, marble, jewellery, &c.; several extensive mills and manufactories have been built within these few years, and the machinery is equal to that of any other part of the kingdom. The town is irregularly built, and excepting some new erections in the corn-market, an infirmary, and an old church, with an elegant and conspicuous tower, it owns no public building worthy of remark. Though placed in the midst of a stone district, the houses are, as usual, built of brick. Within these few years, Derby has come prominently into notice by being on the line of the extended series of railways from Durham and Yorkshire to London. In 1840, the town received from Mr Joseph Strutt the magnificent gift of a pleasure-ground, 11 acres in extent, and called by him the Arboretum. It is replenished with walks, seats, and everyway fitted up for promenading and recreation; it is opened freely two days of the week to all classes, and on other days is accessible upon payment of a small fee. The population of Derby, in 1831, amounted to 23,627; in 1841, 32,407.

*Carlisle*, which in early times was distinguished as a bulwark against the invasions of the Scottish armies, and as a cathedral city, has latterly acquired some note as a seat of manufactures, particularly in the department of cotton-spinning, calico-printing, and the weaving of ginghams, &c. The establishment of railway communication with Newcastle on the one hand, and with the west of England and with Scotland on the other, has within the last few years added to its mercantile prosperity. The population in 1831 was 20,006; in 1841 it was 23,012.

#### Commercial Towns.

At the head of this class stands *Liverpool*, next to London the greatest port in the empire. It is situated in Lancashire, on the east bank of the estuary of the Mersey, at the distance of 36 miles from Manchester, and 204 from London. The town extends for about three miles along the Mersey, and rather more than one mile inland, the situation enjoying a slight slope towards the river. On the side next the country, the town extends into numerous suburban districts, comprehending many villas, the residences of the more wealthy citizens. The rise of Liverpool has been surprisingly rapid. In the reign of Elizabeth, it was only a small village; in 1700, there were about 5000 inhabitants; in 1760, 26,000; in 1801, 77,653; in 1831, 165,175; and in 1841, 282,656.

Liverpool is the grand medium through which the trade of England with Ireland and with America is carried on; and a vast quantity of business is transacted by its merchants with the ports of the Mediterranean, East Indies, and other parts of the world. The leading article of import is the cotton so extensively used in the manufactures of Lancashire, of which, in 1830, out of 793,695 bales imported into England, 703,200 were brought into Liverpool. The rural produce of Ireland—cattle, bacon, poultry, eggs, &c.—forms the import next in amount, the value in 1832 being about £4,500,000 sterling. The duties paid at the customhouse of Liverpool in 1844 were £4,365,526, being about a fifth of those paid throughout the whole kingdom. Its progress as a commercial port may be best traced from the number and burthen of the vessels which have entered the docks during the last thirty years, and which has been as follows:—In 1812, 4599 vessels, and 446,788 tonnage; in 1820, 7276 vessels, and 805,033 tonnage; in 1825, 10,837 vessels, and 1,223,820 tonnage; in 1830, 11,214 vessels, and 1,411,964 tonnage; in 1835, 13,941 vessels, and 1,768,426 tonnage; in 1840, 15,998 vessels, and 2,445,708 tonnage; and in 1845, 20,521 vessels, and 3,016,531 tonnage. Liverpool is the great outlet for the goods manufactured in Lancashire and Yorkshire for sale in America. It is stated that one mercantile house in the American trade has in one year shipped and received goods to the

amount of a million. In connection with the commerce carried on with the United States, there is a large transit of passengers. This was formerly carried on by means of a periodical series of well-appointed and quick-mailing vessels, usually termed *liners*; but since 1839, it has been conducted by means of steam-vessels. There are also steam-vessels conveying passengers daily to and from Dublin, Glasgow, and several Welsh ports, and only a little less frequently to other Irish harbours, and to several ports in the south-west of England.

The town, thus so extensively concerned in that commerce from which England derives its chief glory, presents many external features not unworthy of its mercantile character. Of these the chief is the *Docks*, a magnificent series of deep-water harbours, extending along the whole front of the town. When those now making and those proposed are finished, they will form an aggregate superficies of 203 acres, and 15 miles of quays! In the year ending June 24, 1846, the dues paid by vessels entering and leaving them was £197,477, 18s. 6d. The sight of these docks, bristling with numberless masts, and a scene of constant bustle from loading and unloading, fills a stranger with astonishment. In connection with the docks of Liverpool, we may mention those of *Birkenhead*, on the opposite side of the river, which, when finished, will afford as much of shipping accommodation equal to 206 acres! The rise of Birkenhead, which may date its commercial existence from 1844, is wholly unparalleled in the history of this or any other nation.

The town contains several handsome streets, the chief being Castle Street and Dale Street. The Town-Hall and Exchange Buildings form an elegant and impressive assemblage of objects, having a bronze group in the intermediate court, commemorative of the death of Lord Nelson. The Customhouse is, as might be expected, a conspicuous edifice, but in a heavy style of architecture. The other public buildings—the Corn-Exchange, Lyceum, Athenæum, Royal Bank, the Assize Courts and St George's Hall, Wellington Rooms, Infirmary, &c. are goodly structures. There are upwards of twenty churches belonging to the establishment, many of them of much architectural beauty; a greater number of chapels belonging to various denominations of dissenters; with four Roman Catholic chapels, a meeting-house for Quakers, and a Jew's synagogue. The charitable institutions are numerous and well conducted. About 1500 patients are admitted annually into the infirmary. The Blue-Coat Hospital maintains and educates about 200 boys and girls. The school for the blind is on a most extensive scale. A handsome and spacious theatre, and a circus, are open during great part of the year. At the Royal Liverpool Institution, public lectures are given; and attached to it is a philosophical apparatus and a museum of natural curiosities. A botanic garden was established in 1801 at an expense of about £10,000. There is also a mechanics' institution of unusual extent and elegance, having been erected at an expense of £11,000. It includes schools for the young, as well as for the adolescent; and in the amount of its funds, and variety of the branches of knowledge taught, the establishment may be described as a kind of university for the middle and working-classes of Liverpool. Amongst the remarkable objects connected with the town, the ornamental Cemetery of St James's, formed out of an old stone quarry, is worthy of particular notice. It contains a statue of Mr Huskisson.

*Bristol*, a large seaport town, is situated partly in the county of Somerset and partly in that of Gloucester, at the junction of the rivers Avon and Frome, and about ten miles from the junction of the former (which is navigable) with the Bristol Channel. It is one of a few English towns which possess the dubiously-acknowledged privilege of being counties in themselves, and it is also the cathedral city for the diocese of Bristol. Bristol is an ancient town, and has long enjoyed distinction as a seaport. Previous to the rise of Liverpool, to which it is now greatly inferior, it was the chief port

of the west of England. It still possesses considerable trade, and has further of late years become the seat of some active and thriving manufactures. In 1837, 386 ships, of 76,957 tons burthen, entered the harbour from foreign ports, besides 632 from Ireland; and in the same year, the customs duties collected were £1,153,109. Sugar, rum, and tea, are the chief foreign imports; while the chief exports are the native manufactures, and cotton, woollen, and linen goods. The chief native manufactures are soap, glass bottles, various metallic wares, drugs, dyes, and soda. It is honourable to Bristol that, as in its ancient days of supereminence as a port, it sent out the first English vessel across the Atlantic (that of Cabot, which discovered North America), so in these days it was the first to establish a communication by steam with the same continent. This was done in 1838, when the Great Western performed its first voyage. The population of Bristol in 1831 was 117,016; in 1841, 123,188.

Bristol is a well-built town, containing many spacious streets and squares, and extending into several beautiful suburban villages, as Clifton, Kingsdown, and St Michael's, where the residences of the wealthiest citizens are placed. The city contains many public structures of an interesting character. The cathedral is a fine old specimen of the Gothic architecture, and the church of St Mary Redcliffe is considered one of the most beautiful in England. The 'floating harbour,' formed out of the ancient beds of the two rivers, and surrounded by an immense extent of quay, is a most impressive object: the cost of its construction was not much less than £700,000. The Guildhall, Jail, Commercial Rooms, and Institution (which contains a library, hall for lectures, &c.), are other public buildings of an elegant appearance. Clifton, well known for its hot springs, contains a suite of baths and pump-rooms.

*Newcastle-on-Tyne.*—This ancient and prosperous seat of commerce occupies a somewhat inconvenient situation on the left or north bank of the Tyne, at the distance of about ten miles from the sea. It is locally in the county of Northumberland, and by means of a bridge across the Tyne, is connected with the populous borough of Gateshead, in the county of Durham. It owes the origin of its name to Robert, the eldest son of William the Conqueror, who erected a fortress on the high bluff which here overhangs the river, and gave it the name of Newcastle. For ages the town was surrounded by strong walls, as a protection against invading Scottish armies: these, however, have disappeared, and in modern times the town has spread over the irregular acclivities and upland which border the river. The old fort or castle still exists, also the ancient Gothic church of St Nicholas, whose elegant turret is conspicuous at a considerable distance. The main cause of the increasing importance of Newcastle is its fortunate situation in the midst of the great coal-field of Northumberland and Durham, the produce of which finds a ready outlet by the Tyne. The plentifulness of coal has led to the establishment of numerous manufactures, among which are numbered cast and wrought iron, machinery, lead, glass, chemical productions, pottery, soap, and glue. The gross receipts at the customhouse, which includes also the port of Shields, for the year 1848, was £466,956. The older parts of the town near the river exhibit a busy scene of industry; here are crowded together ship and boat-building yards, wharfs for vessels, iron foundries and machine manufactories, and all the usual works connected with a great seaport. The streets in this quarter are dirty and smoky, but other parts of the town are of great elegance. Since 1834, by the extraordinary energy and taste of Mr Richard Grainger, a speculating architect, a large portion of the town has been taken down and rebuilt with handsome stone houses, amidst which are various public buildings, including a theatre, an Exchange, extensive markets, &c. Newcastle must be considered the metropolis of a rich and populous district, including Tynemouth, North and South Shields (all at the mouth of the Tyne), Sunderland, Durham, and Gateshead; and with

these it is intimately connected by means of the river, railways, or otherwise. At Shields and Sunderland are the great depôts of shipping in the coal and other trades. Besides its remarkable manufacturing and commercial industry, Newcastle is distinguished for its philosophical and literary institutions, no other town of its kind possessing so many inhabitants of cultivated taste. In 1831, including the population of Gateshead, which was 15,177, Newcastle and its suburbs had a population of 68,790; in 1841, the population of Gateshead was 19,843; of Newcastle, 69,430—total, 89,273.

*Hull* (properly Kingston-upon-Hull) is situated at the confluence of the River Hull with the estuary of the Humber, in the East Riding of Yorkshire, of which district it is the principal town. It commands an extraordinary amount of inland navigation, not only by means of the Trent, Ouse, Derwent, and other branches of the Humber, but by means of canals connecting with those streams, and penetrating to the very heart of England. It is the principal outlet for the manufactures of York and Lancashire towards the continent of Europe, the chief seat of the northern whale-fishery, and one of the most important stations for steam-navigation in the island, having packets of that kind voyaging not only to London, Newcastle, Leith, and Aberdeen, besides many inland places in its own district, but to Rotterdam, Hamburg, and occasionally to some of the ports in what is more particularly called the north of Europe. Hull was a noted port so early as the reign of Edward I.; and in the seventeenth century it was a great state depôt for arms, on which account the possession of it in the time of the civil war became an object of much importance. The refusal of its governor, Sir John Hotham, to give it up at that time to Charles I., or even to admit his majesty within the gates, is a conspicuous incident in English history. For some years, owing to various circumstances, some branches of the commerce of the port have experienced a decline rather than an advance; but it is still a town of large trade. In 1829, 579 vessels, of 73,248 aggregate tonnage, belonged to Hull. For the accommodation of the shipping there is a splendid range of docks, with all the accommodations suitable for storing a vast quantity of merchandise. The population of the town in 1841 was 65,670.

*Chester* is one of the less important and less populous of the commercial towns of England. Such importance, however, as it possesses as a commercial town, is enhanced by its being a county town and cathedral city, and the residence of a considerable number of persons in independent circumstances. It is also remarkable for its antiquity and its historical associations, as well as for some local features of an unusual kind.

It is situated within a bend of the Dee, a few miles from the point where that river joins an estuary branching from the Irish Channel. The two principal streets cross each other at right angles, and the town is still surrounded by the massive walls which were originally designed to protect it from warlike aggression, but are now only useful as an agreeable promenade, from which some pleasant views of the surrounding country may be obtained. The streets are formed in hollows dug out of rock, so that the lowest floor of each house is under the level of the ground behind, though looking out upon the carriage-way in front. The paths for passengers are not here, as is usually the case, formed in lateral lines along the streets, but in a piazza running along the front of what in England is called the *first*, and in Scotland more correctly the *second* floor, of the houses. These piazzas, called in Chester *the Rows*, are accessible from the street by stairs at convenient distances. There are numerous shops entered from them, and they in some places still retain the massive wooden balustrades with which all were originally furnished, but for which, in other places, light iron railings have been substituted. Where the houses and balustrades are old, the effect is very curious and striking, and apt to awaken ideas of ancient usages and habits long passed away. The cathedral of Chester contains some curious

ancient architecture. The castle is a splendid modern building, on the site of the powerful fortress which was once of such importance as a check upon the Welsh: it contains the county court-house, jail, &c. The principal other buildings are the Halls built by the merchants to serve as marts, of which there are three, besides the Exchange. The bridge across the Dee is a remarkable object, being of one arch, with a span of 200 feet; it cost £40,000.

Chester was an important station of the Romans, from whom it derived the cross form of its two principal streets, and of whom many relics have from time to time been dug up. It retained its importance during Saxon and Norman times, and in the thirteenth and fourteenth centuries was a flourishing city, with a large maritime trade. It then declined, in consequence of natural obstructions to the navigation of the river. From the year 1328 downwards, it was remarkable for the annual performance of a peculiar class of theatrical representations, similar to those performed at Coventry, and termed *Mysteries*. To modern taste these would seem the most gross burlesque of sacred subjects; but so convinced were the clergy of those days of their edifying qualities, that a thousand days of pardon from the pope, and forty from the bishop of Chester, were granted to all who attended them. After a long period of declension, the trade of Chester was revived by the cutting of a new channel for the river, whereby vessels of 600 tons burthen were enabled to come to the quays near the town. The commerce, with the exception of a few ships which visit Spain, Portugal, the Mediterranean, and the Baltic, is chiefly confined to Ireland, whence an immense quantity of linen, hemp, flax, skins, and provisions, is imported. The exports of Chester are cheese (the staple production of the county), lead, coal, calamine, copper-plates, and cast-iron. Ship-building is carried on to a considerable extent, and there are some manufactures of inferior consequence. The population in 1831 was 21,363; in 1841, 22,961.

*Southampton* is an ancient, but considerably modernised town, the capital of Hampshire, and, next to Portsmouth and Plymouth, may be considered the chief outpost on the south coast. It enjoys a situation at once pleasant and convenient, in a vale adjoining to the bay bearing its own name. In modern times, the town has been greatly improved and increased by the erection of lines of handsome streets in the environs, the residence of a respectable and leisurely population. Among the attractions of the neighbourhood are those of the New Forest, which almost adjoins the town, and a beach forming a pleasant bathing-place in summer: few sea-side towns are more salubrious or agreeable. With the Isle of Wight, at a few miles' distance, there is a constant communication by steamboats. The South-Western Railway, which terminates near the shore of the bay, has greatly advanced the interests of the town, by making it a *dépôt* of traffic in connection with the metropolis; and there are now constructing, at a great cost, large wet-docks and wharfs for shipping. A considerable trade is already carried on with foreign countries, and the port is a main point of communication between England and Guernsey, Jersey, and Havre, in which, and some other respects, it is a rising rival of the neighbouring town of Portsmouth. The population in 1831 was 19,324; in 1841, 27,490.

University Cities.

*Oxford*, the chief of this limited class of cities, is the principal town in Oxfordshire, and is situated in a valley at the confluence of the Isis and Cherwell, at the distance of 58 miles from London. Besides being the seat of the celebrated university named from it, it is the seat of an episcopal see. Containing twenty colleges and five 'halls,' a cathedral, and thirteen elegant parish churches, besides the Radcliffe Library, the University Theatre, and several other elegant public buildings, all condensed into a small space, amidst streets some of which are straight and elegant, while none, except a few of an obscure character, are

mean, Oxford appears to a stranger as beautiful externally as its historic character renders it venerable. The High Street, in which several colleges are situated, is generally acknowledged to be one of the finest streets in the world. The origin of the university is usually attributed, but upon no certain authority, to King Alfred. Oxford has certainly, however, been a famed seat of learning since the twelfth century. Each college and hall has its own students and teachers, revenues and regulations; yet they are all united under the government of one university. The officers by whom the university is immediately governed, are the chancellor, high steward, vice-chancellor, and two proctors. In addition to the private officers in each college and hall, who see that due order and discipline are preserved, and all the liberal sciences taught, there are twenty-three public professors of the several arts and sciences. In 1844, there were 5026 members on the books, one-third of whom, in their capacities as fellows, &c. were maintained by the revenues. The students wear a peculiar dress, varied according to their status in the college. They all live within the precincts of their respective colleges.

*Cambridge* is the chief town in Cambridgeshire, and is situated on the Cam, at the distance of 60 miles from London. It is also an elegant city, though less so than Oxford. The university has no certain date before 1229: it comprehends seventeen colleges, which in most respects are similar to those of Oxford. King's College Chapel, built in the reign of Henry VI., is considered the most beautiful structure in either of the two university towns.

Naval Stations.

*Portsmouth*, the principal rendezvous of the British navy, is situated on the west side of the Isle of Portsea in Hampshire. To the west of the island is the bay called Portsmouth Harbour, excelling every other on the coast of England for its spaciousness, depth, and security. The obvious utility of this harbour in such a situation caused it to be used at an early period as a station for shipping, and hence the rise of the town of Portsmouth on the narrow inlet by which it communicates with the English Channel. It is also to be observed that the strait between the mouth of this harbour and the Isle of Wight, forms the celebrated roadstead of Spithead, which is capable of containing a thousand sail at anchor in the greatest security. The original or old town of Portsmouth, surrounded by ancient walls; the modern suburban towns of Portsea and Southsea, respectively situated to the north and south of the original town; and the town of Gosport, on the opposite side of the inlet to the harbour, may all be said to form one cluster of population, probably numbering not less than 70,000. The beach opposite Southsea being well adapted for sea-bathing, has been the cause of that suburb or village becoming a watering-place of considerable note.

The docks, arsenal, building-yards, and all the various establishments concerned in the fitting-out and safe keeping of the national shipping, render Portsmouth an object of wonder to all who see it for the first time. The Dockyard includes the great area of 100 acres. The Smithery is a vast building, where anchors are wrought, weighing from 70 to 90 hundredweight each. On the Anchor-Wharf hundreds of these useful implements are piled up, ready for immediate service. The Ropery, where the cordage for the vessels is prepared, is three storeys high, 54 feet broad, and 1094 feet long. The Gun-Wharf is an immense arsenal, consisting of various ranges of buildings for the reception of naval and military stores, artillery, &c. The Small Armoury is capable of containing 25,000 stand of arms. There is a naval college, where a hundred scholars in time of war, and seventy in time of peace, are taught; thirty, who are the children of officers, being maintained and educated at the public expense. During war, the number of persons employed in the various establishments connected with the public service at

## ENGLAND AND WALES.

Portsmouth has amounted to 5000. The principal buildings connected with the arsenal and dockyards, are the commissioner's house, the government house, the victualling office, the port-admiral's house, and the naval and military barracks. The promenade along the fortifications forms one of the most agreeable features of the town. Amongst objects of curiosity we may specify the *Victory*, Nelson's flag-ship at Trafalgar; the Semaphore Telegraph; and the house (No. 110 High Street) in which the Duke of Buckingham was temporarily residing, when in front of it he was stabbed to death by Lieutenant Felton in 1628. The church of Portsmouth is a spacious Gothic structure, with a comparatively modern tower, useful as a landmark to seamen. There are various charitable, literary, and scientific institutions connected with the town.

*Plymouth* is another important naval station, besides being a thriving commercial town. It is situated at the head of the capacious haven of Plymouth Sound in Devonshire, on the east side of a tongue of land formed by the estuaries of the rivers Plym and Tamar, which here empty themselves into the sea. Essentially connected with Plymouth is *Devonport*, situated in the immediate neighbourhood, and properly an appendage of Plymouth, though of late years distinguished by a separate name. The united population in 1841 was 75,599. Plymouth having gradually risen from the condition of a small fishing-town to its present size, most of the streets are irregular, and by no means elegant or commodious; but the new parts of the town are handsome, and are spreading rapidly.

Plymouth carries on a considerable trade in timber with North America and the Baltic, and an intercourse has been established with the West Indies. The coasting-trade is chiefly with London, Newcastle, Newport (in Wales), and Bristol. The chief imports are coal, culm, corn, wine, and timber. It is as a naval and military station that the town is chiefly distinguished. Situated upon a capacious and secure natural harbour, near the mouth of the English Channel, it is well adapted for this purpose, fleets having a ready exit from it upon any expedition towards the Mediterranean, the Indies, or America. The dock, which is situated at Devonport (formerly on that account called Plymouth Dock), extends along the bank of the Tamar, in a curve 3500 feet in length, with a width at the middle, where it is greatest, of 1600 feet, and at each extremity 1000, thus including an area of 96 acres. Of the fortifications connected with Plymouth, the most remarkable is the citadel, which was erected in the reign of Charles II. It is placed in a most commanding situation on the east end of the height called the *Hoe*, which shelters the town from the sea. It is exceedingly well fortified, and is constantly garrisoned. It contains the residence of the governor of Plymouth, and barracks for 500 or 600 troops. The Victualling Office, an important establishment, containing store-houses, granaries, baking-houses, and cellars for supplying the meat, bread, and liquors required to provision the vessels of the Royal Navy, occupies a splendid building in the adjacent township of East Stonehouse. The port of Plymouth is distinguished for its capacity, and the security which it affords in its several parts. It is capable of containing 2000 sail, and is one of the finest harbours in the world. It consists of three divisions or harbours—Sutton Pool, immediately adjoining the town; Catwater, an extensive sheet, formed by the estuary of the Plym; and the harbour or bay of Hamoaze. At the mouth of these harbours, the great bay of Plymouth Sound forms an excellent roadstead, which is now completely secure by the erection of the breakwater across its entrance. [For an account of this immense structure, see *Breakwaters*, p. 432, Vol. I.] The Eddystone Lighthouse is also an important appendage to the harbour, the entrance of which would, without this beacon, be extremely dangerous.

The public buildings of Plymouth are—the Custom-house, the Exchange, the Athenæum, the Public Library, the Theatre, the Classical and Mathematical School, the

Mechanics' Institute, &c. Of the two parish churches, the most ancient is that of St Andrew, built previously to 1291, a handsome building of the Gothic order; Charles's Church is also a Gothic structure. Among the charitable institutions, which are about 30, are a workhouse, a public dispensary, an eye-infirmary, a lying-in charity, a public subscription school, almshouses, Bible societies, &c.

### Towns of Residence and Recreation.

*Bath*.—This is reckoned the best-built town in England, and is a favourite residence of the higher classes, either for recreation or in pursuit of health. It is situated in Somersetshire, at the distance of about 108 miles west from London, and lies in a valley divided by the River Avon. Though of great antiquity, the place came into notice and rose to importance in comparatively modern times, in consequence of possessing certain hot mineral springs, considered to be efficacious in the cure of different complaints. The water issues from the ground at a temperature of from 109° to 117° of Fahrenheit, and the quantity discharged daily from the various outlets is 184,320 gallons. The water has been analysed, and is found to contain sulphate of lime, with considerably lesser proportions of muriate of soda, sulphate of soda, carbonic acid, and carbonate of lime, also a minute portion of silica and oxide of iron. It is stimulating in its properties, and is said to be most successful in cases of palsy, rheumatism, gout, and cutaneous diseases. Over the springs there are elegant pump-rooms and baths. The modern parts of the town are built as streets, crescents, and squares, the houses being of polished sandstone, and in some instances constructed with much taste. Living is expensive in the town during the fashionable season. The population in 1831 was 38,063; in 1841, 52,346.

*Cheltenham* competes with Bath as a fashionable resort for valetudinarians, real or imaginary. It is situated in Gloucestershire, 88 miles west from London, and 39½ north-east of Bath. The situation is exceedingly delightful, being remarkably well sheltered by the range of Cotswold Hills on the north-east, and having an exposure to the south and west; it is on this account preferred to all other towns in England by persons from India and other hot climates. Besides being attractive from the salubrity and mildness of its climate, Cheltenham, like Bath, possesses mineral springs reckoned of value for medical purposes, but particularly for invalids with diseased livers. There are several springs, some of which are chalybeate, but their properties and strength are liable to variation. Cheltenham is laid out, in a very ornamental manner, with walks and pleasure-grounds, and may be described as perhaps the prettiest town of a small size in England. As in Bath, the expense of living is very great. The population of the parish in 1831 was 22,942, about one-half of whom belonged to the town; in 1841, it was 31,207.

*Brighton*, on the coast of Sussex, has risen into importance within the last sixty years, partly in consequence of a beach remarkably well adapted for sea-bathing, and partly from its attracting the regard of George Prince of Wales, who reared a marine palace here in a Chinese style. The population in 1831 was 40,634; in 1841, 48,567. Brighton is an elegant and airy town, with much to render it agreeable as a place of residence for persons in affluent circumstances. The Steyne, a spacious and beautiful lawn, nearly surrounded by houses, the Marine Parade, and several terraces overlooking the sea, furnish delightful walks; while the Baths, Theatre, Assembly Rooms, &c. form additional attractions. There is a regular intercourse with Dieppe by steam-vessels. The Chain-Pier is a remarkable object: it was erected in 1823 at an expense of £30,000, is 1134 feet long, 13 feet in breadth, and is supported on four clusters of piles.

Amongst other towns of this class, we can only notice *Herne Bay*, *Margate*, and *Ramsgate*, situated on the coast of Kent, and which may be considered as the chief places of summer recreation for the inhabitants of

London, to and from which steamers ply daily. Herne Bay is a place of recent date, rising into notice, and possessing a pleasant open beach, with space for promenading. Margate is a town of a much earlier date, situated in an open part of a bold line of chalky cliffs, and consists of a confused cluster of streets, with some lines of building of a more airy description in the environs. The town is well supplied with shops, bazaars, and places of amusement during the bathing-season; it also possesses numerous respectable boarding-houses, where, on moderate terms, a person may reside for a short time in a very agreeable manner. At these houses, parties of pleasure are made up for the day, the expense of cars and refreshments during the excursion being defrayed by general contribution. Within a mile or two along the coast is another summer retreat called *Broadstairs*; and beyond it, at an equal distance, is Ramsgate. The chalk cliffs here, which are bold and precipitous, afford a high and salubrious position for the chief part of the town, and beneath there is a fine tract of sandy beach for the use of bathers. The harbour at Ramsgate is one of the best in England, and affords shelter to all kinds of vessels in the Downs.

#### Cathedral Towns.

Of this class of towns, besides those which have been already noticed under other heads, we can here only advert to three of more than usual importance:—

*Canterbury*, the capital of Kent, is a city of great antiquity, having formed the seat of an ecclesiastical establishment to St Augustine, the apostle of Christianity to Britain in the sixth century. In the tenth and eleventh centuries, the town derived great importance from the erection or extension of a cathedral, on a most extensive scale, and of the purest Gothic architecture. In 1162, the archiepiscopal see was bestowed on the famous Becket, who enjoyed it eight years, till the period of his murder in 1170, when his shrine became an object of extraordinary reverence, and brought pilgrims in thousands from all parts of the kingdom. The cathedral, which thus became celebrated, still exists, in a slightly-altered and improved condition. Its form is that of a cross, with a central tower of unrivalled workmanship, reaching to a height of 236 feet. The size of the building is immense: the length inside, from east to west, being 514 feet; height of the vaulted roof, 80 feet; breadth of the nave and side aisles, 71 feet; and breadth of the cross aisles, from north to south, 124 feet. The interior exhibits a number of interesting monuments of distinguished individuals. Altogether, the cathedral is a work of exceeding grandeur, and, with exquisite beauty of form, possesses a profound historical interest. The town of Canterbury is old, and, like most cathedral towns, is a dull and formal place of residence, with a proportion of genteel inhabitants. It is, however, neat and clean, and is surrounded by a fertile and pleasant tract of country. It has a number of large hotels and posting-houses, to accommodate the numerous travellers passing between the metropolis and Dover, the chief out-port for France. The distance from London is fifty-six miles, and from Dover sixteen. The only object of attraction in the town besides the cathedral, is a pleasure-ground called the *Dansejohn*, a corruption of the word *donjon*, such a building having once occupied the spot in connection with the city walls. The area of the field is laid out with an avenue of trees, and is principally otherwise a grassy esplanade, open freely to all the inhabitants. In 1790, the field was presented by Mr Alderman James Simmonds for the use and recreation of the inhabitants in all time coming—an act of generosity deserving the highest commendation. The population of Canterbury in 1831 was 14,463; in 1841, 15,422.

*York* is considered as the second city in the kingdom in point of dignity—the chief town of the county, and the cathedral city of the archiepiscopal diocese bearing its name—is situated at the confluence of the rivers *Foss* and *Ouse*, in one of the richest and most extensive plains in England. Its population in 1831 was 25,359;

in 1841, 30,152. York, whatever its first rise might be, was a city of the Romans, and occupied by Roman citizens as a *colony*. It was successively the seat of Adrian, Severus, and other emperors: Severus died here in the year 210. At the time of the Norman Conquest, it was a city of considerable consequence and size. This eminence it retained for several centuries, but latterly it has sunk into a mere county and cathedral town; that is to say, a place where a considerable number of legal and ecclesiastical functionaries reside, and from which articles of necessity and luxury are diffused over a neighbouring rural district.

It is entered by four principal gates or bars, has six bridges, a cathedral, twenty-three churches, besides places of worship for various dissenting bodies; a guild-hall, county-hall, and other public buildings. The most remarkable object by many degrees is the Cathedral, or Minster, a most superb specimen of the Gothic architecture, measuring in length 524½ feet; in breadth across the transepts, 222 feet; the nave being in height 99, and the grand tower 213 feet. The various parts were built at different times between 1227 and 1377. The parts most admired are the east window, and the screen dividing the choir from the body of the church. This window consists of upwards of 200 compartments of stained glass, containing representations of the Supreme Being, saints, and events recorded in Scripture. The screen is a piece of carved wood-work in a highly-ornamental style. The chapter-house is also much admired: it is a magnificent structure, of an octagonal form, 63 feet in diameter, and 68 feet in height. York Minster has within the last ten years twice suffered severely from fire. The damage produced on the first occasion—namely, the destruction of the wooden work in the choir—was completely and successfully repaired; that which took place on the second occasion, and which consisted of the destruction of the interior of one of the smaller towers and the roof of the nave, has also been repaired. York was at one time a commercial town of some importance, conducting trade by means of the river *Ouse*, which is navigable for vessels of 120 tons burthen. It still possesses a few small manufactures.

*Winchester*, a town of great antiquity in Hampshire, at the distance of 62 miles from London, is situated in the bottom of a rich grassy vale, through which flows the *Itchin*, a small river which issues into the sea at Southampton. There was a town here before the Christian era, and it afterwards became the principal city of the Danish, Saxon, and Norman dynasties. It was the scene of Alfred and Canute's glories; and here, with innumerable princes, bishops, and abbots, they lie interred. Till the revolution, it continued a chief place of residence of the royal family; a palace built by the Stuarts is now used as a barrack for soldiers. In the reign of Edward III. (1366), Winchester became the episcopal see of the celebrated William of Wykeham, who greatly improved the cathedral, and instituted a college for the education of youth. The cathedral has undergone various mutations; but being lately repaired and cleaned, is now one of the finest structures of the kind in Britain. The splendid mausoleum of William of Wykeham, in one of its aisles, is an object of great interest. At a short distance from the cathedral are placed the venerable buildings composing the College of Wykeham, at which a number of young gentlemen are educated and prepared for the university. Another highly-interesting object of antiquity is the Hospital of St Cross, situated about a mile down the *Itchin*. Founded by Henry de Blois, bishop of Winchester, and brother of King Stephen, in 1136, St Cross is the most perfect specimen remaining in England of the conventual establishments of the middle ages, and affords a residence and means of subsistence to thirteen indigent old men. Winchester is composed of a variety of old streets, and seems among the least improved towns in England. Latterly it has been inspired with a little animation, by becoming a station on the line of the London and Southampton Railway. Population in 1831, 9212; in 1841, 9370.

# SCOTLAND.

SCOTLAND, one of the component parts of Great Britain, occupies the northern, the smaller, and less fertile portion of that island. It lies between lat.  $54^{\circ} 38'$  and  $58^{\circ} 40'$  north, and between long.  $1^{\circ} 46'$  and  $6^{\circ} 4'$  west, or, including the Hebrides,  $7^{\circ} 44'$  west. It is thus washed on the west and north by the Atlantic, and on the east by the German Ocean; and on the south is bounded by England, the Solway Firth, and part of the Irish Sea. Its coast-line presents the most fantastic irregularities: here jutting into the ocean in high narrow peninsulas, there receding far inland, in lake-like gulfs, and again suddenly starting seaward, and breaking into a number of bold rocky headlands. Its greatest length, from the Mull of Galloway on the south to Dunnet Head on the north, is about 280 miles; its breadth is variable, being about 146 miles between Buchan Ness in Aberdeenshire and the extreme point of Ross-shire on the west, but diminishing to little more than 30 miles between the Firths of Forth and Clyde. The entire surface is estimated at 30,094 square miles, of which 26,014 are mainland, and 4080 insular.

## SUPERFICIAL FEATURES.

Superficially, the country may be described as mountainous and rugged—its central and southern districts, however, exhibit less of this character; hence the common distinction of *Highlands* and *Lowlands*. A line drawn from Aberdeen to Glasgow may be regarded as the boundary between the two regions—the former a country full of romantic scenery, savage precipitous mountains, lakes, dreary moorlands, rushing streams, deep glens, and wild hanging woods; the latter being less elevated and irregular, but still presenting several considerable mountain-ranges. A more correct division, perhaps, would be into northern, central, and southern regions: the first comprising the Highlands proper; the second that triangular space enclosed by the line drawn from Aberdeen to Glasgow, and another line formed by the courses of the Clyde and Tweed; and the third region all the counties to the south-west of these rivers.

The principal *mountain-ranges* and groups are:—1. Those north of the Caledonian Canal, an irregular and rugged conformation, of which the highest points are

Ben More, Ben Wyvis, and Ben Attow—the last 4000 feet. 2. The Grampians, a well-defined, but branching range running across the country—the highest peaks of which are Ben Cruachan, Ben Nevis, Ben Avon, Cairngorum, Cairatoul, and Ben Macdhui—the last 4390 feet. 3. The Central or Lowland Group, the component chains of which are the Ochil, Sidlaw, Campsie, Lomond, Pentland, and Lammermuir Hills—the highest point being Ben Clach in Clackmannan, 2359 feet. 4. The Cheviots, with their continuation the Lowthers, &c. that form the great water-shed of Southern Scotland, none of which exceed 2700 feet. All these chains or groups cross the country, and preserve a wonderful degree of parallelism: indeed, taking the Forth as the central depression of a vast trough, the edges of which are formed respectively by the Grampians and Cheviots, all the other hill-ranges, both geologically and in point of altitude, may be looked upon as so many descending steps to the centre.

There are no great *plains* in Scotland, a feature not to be expected from the limited extent and peculiar configuration of the country. There are, however, a number of considerable valleys, known as *carses*, *straths*, *haughs*, and *dales*, intermediate between the mountain-ranges; and these form, as it were, the granaries of the country. The principal of these are, Strathmore—that is, 'Great Valley'—lying between the Grampians and Ochils, and extending through part of Perth, Forfar, and Kincardine; the Carse of Gowrie on the north of the Tay; Strathearn, lying along the course of the Earn to where it joins the Tay; the Carse of Stirling and Falkirk, in the valley of the Forth; the Howe of Fife, lying along the Eden; Clydesdale; and the Merse of Berwick. The cultivated grounds, which form scarcely a third of the whole surface, chiefly lie in tracts sloping to the sea-coast, and in the lower parts of these vales. The less precipitous hilly districts are chiefly occupied as pastoral ground for sheep and cattle. Wood, which once covered a large portion of the surface, is now chiefly confined to the neighbourhood of gentlemen's seats, and to plantations which have been raised within the last sixty years for the protection of arable lands from the cold easterly and north-easterly winds.

## GEOLOGICAL STRUCTURE.

The rock formations of the country commence with the earliest primaries, and if we except a few insignificant and dubious patches, terminate with the coal-measures, or the immediately overlying new red sandstone. The Highlands constitute one of the best examples of a primary country, whose strata are contorted and disrupted into a thousand irregularities by effusions of granite, greenstone, and other early igneous rocks; and with the exception of a small secondary basin in the plain of the Tweed and along the Solway Firth, the same remark is applicable to all the southern mountainous part of the country. The secondary formations—old red sandstone, carboniferous limestone, and coal-measures, with their associated traps and basalts—occupy the central portions of the country, forming a broad band, which is bounded on the north by a line drawn from Stonehaven to the mouth of the Clyde, and on the south by one drawn from Dunbar to Girvan in Ayrshire. In this band or trough, which slopes from both sides to the Forth and Clyde, occur the coal, limestone, and ironstone, which, within the last thirty years, have so much contributed to the commercial advancement of Scotland.

The chief mineral produce of the country consists of excellent granite, as that of Aberdeen and Kirkcudbright; marble, as that from Assynt; slate from Ballahulish, &c.; limestone in almost every county; building

stones of first-rate quality, as those of Fife and Mid-Lothian; coal from the extensive fields of Fife, Mid-Lothian, Linlithgow, Stirling, Lanark, and Ayr; ironstone in most of these coal-fields, but principally in Lanark and Fife; lead mainly from the Lowther range; silver is extracted in small quantities from the lead; strontian is found in Argyle; antimony in Ayrshire; alum is obtained in large quantities from the coal-shales near Campsie; clay, for tiles and bricks, is found abundantly; and several of the precious stones, as garnet, rock-crystal, and agate.

## HYDROGRAPHY.

The *gulfs, bays, straits, &c.* as already hinted, are extremely numerous and intricate. On the east the principal are—Dornoch Firth, a large open expanse of water; Cromarty Firth, of considerable depth, and so completely landlocked, that it would form one of the finest harbours in the world; Moray Firth, running far inland, and communicating, by means of the Caledonian Canal, with the Atlantic Ocean; the Firth of Tay, navigable for large vessels to Dundee, and to smaller craft to Perth; and the Firth of Forth, running inland for fifty miles, presenting several subordinate bays, containing a number of indifferent harbours, and navigable for ships of any burden to Alloa, and for small steamers to Stirling. On the south and west coasts there are—the large shallow estuary of the Solway; Wigton Bay; Luce Bay; the important Firth of Clyde, with its several picturesque lochs, navigable for large vessels as far as Glasgow Bridge, and communicating with the Forth by means of a canal. To the north of this the indentations and creeks vernacularly called *lochs* and *sounds* become so numerous and complicated, that their figure and extent will be best comprehended by referring to the map.

The *capes*, or, as they are locally styled, 'heads and nesses,' are equally numerous. The principal are—Cape Wrath, Dunnet Head, and Duncan's Head, on the north; Tarbet Ness, Troup Head, Kinnaird's Head, Buchan Ness, Buddon Ness, Fife Ness, and St. Abb's Head, on the east; Southernness, Burrow Head, and the Mull of Galloway, on the south; Corraill Point, Mull of Cantire, Mull of Oe, Point of Rinna, Ardnarmurchan, and Stoir Point, on the west; Aird Point, in Skye; Barra Head and the Butt of Lewis, respectively the southern and northern extremities of the Hebrides; and Sumburgh Head, the most southerly projection of the Shetland islands. Most of these headlands are the sites of lighthouses or beacons, and form important objects to the navigator.

The *islands* and *outlying rocks* connected with Scotland constitute one of its most characteristic features—forming, as they do, nearly a sixth part of the estimated area of the country. Their value, however, is by no means proportionate to their extent—most of them having rugged coasts and bare hilly surfaces, exposed to the injurious influences of the sea-breezes. The east coast presents no islands, with the exception of those in the Firth of Forth, the chief of which are Inchcolm, Inchkeith, and the Isle of May, the two last being surmounted by lighthouses. At the entrance of the Forth is the Bass Rock, a singular basaltic mass, rising perpendicularly from the sea to the height of 400 feet, bearing a scanty herbage, which pastures a few sheep, and being the favourite resort of the gannet or solan goose. About twelve miles east of Buddon Ness lies the Bell-Rock, or Inchcape, a dangerous ledge, about 850 yards in length and 110 in breadth, wholly covered at high water. On this a lighthouse, after the model of the Eddystone, was erected in 1810, the lantern of which is 90 feet above the highest spring-tides.

The islands on the west coast may be conveniently arranged into three great groups—those in the Firth of Clyde; the Inner Hebrides, which, like Skye, Mull, &c. lie adjacent to the mainland; and the Outer Hebrides, separated from the mainland by the wide channel of the Minch. The islands of the Clyde are Bute, about 18 miles in length by 5 in breadth, high

and rugged towards the north, but of gentler aspect and milder climate on the southern part—so much so as to be regarded as the Isle of Wight of Scotland; Arran, a large oval island, about 18 miles by 12, consisting of high heath-clad hills, fully 3000 feet in height, and celebrated for their geological phenomena; the two Cumbræ; and Ailsa Craig, an isolated mass, 15 miles off the coast of Ayr, about 2 miles in circumference, and rising to a height of 1000 feet, pastured by a number of goats, and a favourite breeding-place for sea-fowl. The chief of the Inner Hebrides are Skye, Raasay, Rum, and Eig, belonging to Inverness; and Mull, Iala, Jura, Tiree, Iona, celebrated for its ecclesiastical associations, and Staffa, to Argyle. The Outer Hebrides, or Western Isles, forming a high range about 140 miles long, consist of Lewis, Harris, North Uist, Benbecula, South Uist, Barra, &c.—all decidedly rugged and barren, and in many places covered with extensive tracts of muir and moss; Skerryvore, a dangerous group of rocks, lying far seaward, and all but covered at highwater, is now the site of a lighthouse, exposed to the weight and fury of the Atlantic waves.

On the north are two distinct groups of the Orkney and Shetland islands; the former being separated from the mainland by the Pentland Firth, in which lie Stroms, the Skerries, and other rocky islets; and the latter from the former by a channel 48 miles across, in the middle of which stands Fair Isle. The Orkneys consist of about sixty-seven islands, of which forty are uninhabited, the rest tolerably fertile, and the whole occupying an area of 281,600 acres. The Shetlands are about 100 in number, of which a great proportion are untenanted—the whole exposing a wild rugged surface of 563,000 acres to an ungenial climate.

The *lakes* or *fresh-water lochs* of Scotland are numerous; and, like most sheets of water occupying irregular mountain gorges and valleys, are all less or more celebrated for picturesque scenery. In the southern portion of the country there are few of any size—Lochs Ken, Cree, Doon, and St. Mary's being the principal; in the central or true Lowland district there are still fewer, Lochleven in Kinross—celebrated for its historical associations with Mary, and now for its delicious trout—being the largest; but in the northern or Highland region they are not only numerous, but extensive. Loch Lomond, forming the boundary between Dumbarton and Stirling, and discharging its waters into the Clyde by the river Leven, is by far the largest of British lakes, being about 24 miles long, and varying from 1 to 7½ in width; its depth from 100 to 800 feet. The lochs of Argyleshire—Awe, Lydoch, Shiel, &c.—are also of large dimensions, but present less beauty; the same may be remarked of those in Inverness-shire—Ness, Laggan, Erich, Artaig, Quoich, &c.; of those in Ross—Maree, Fannich, &c.; and of those in Sutherland—Shin, Naver, Hope, &c. The lakes of Perthshire, as a whole, are the most celebrated for their picturesque beauty, the associated hills, passes, waterfalls, and shaggy woodlands, presenting scenery, according to the estimation of some, unequalled by any other in Europe; the chief are Katrine, Vail, Earn, Tay, Rannoch, Tummel, and Garry. (See p. 229.)

The *rivers* in this part of Great Britain, owing to the rugged and mountainous character of the country, present very different features from those in the southern section. None of them has the sluggish aspect of the English rivers, nor does their course lie through broad level valleys; but descending from high mountains, and cutting for themselves deep channels, they are often interrupted by rapids and waterfalls, and in consequence, with two or three exceptions, they are of no use to navigation. Beginning with those on the east, the principal are—the Findhorn and Spey, descending from the north slope of the Grampians, both extremely rapid in their flow, and subject to sudden and destructive floods; the Don and Dee, also Grampian rivers of some extent, but unnavigable; the Tay, the largest of Scottish rivers, fed by a number of mountain tributaries, navigable, as has been stated, to Perth; the

## SCOTLAND.

Forth, with its affluents Teith, Devon, &c. navigable to Stirling for vessels of seventy tons; and the Tweed, with its numerous tributaries or 'waters,' rendered famous in Border song, also unnavigable. On the west, the only river of note is the Clyde, having also a number of affluents. The most celebrated *waterfalls* connected with these rivers are those of Clyde, the Gray-mare's-tail on the Moffat-water, the Caldron Linn on the Devon, and the Falls of Foyers in Inverness-shire; for descriptions of which see the section devoted to Remarkable Natural Scenery.

Of limpid and copious *springs* no country can possess a more liberal supply; but few of them are of mineral or medicinal celebrity—Pitcaithly in Strathearn, Dumblane, Airthrey, St Bernard's near Edinburgh, Innerleithen, and Moffat, being those that are in any way frequented by invalids.

### CLIMATE.

The climate of Scotland is more severe than that of England; 'but'—we quote M'Culloch—'owing to the proximity of most parts of the country to the sea, and the numerous firths and deep bays by which it is penetrated, it is less severe than might, from the latitude, be expected. The mean annual temperature of places near the level of the ocean, throughout the country, averages about 46½° Fahrenheit. At Edinburgh, which is from 300 to 400 feet above the sea-level, the mean temperature of the year is 47° 8', which may be taken as that of the inland parts generally in the south of Scotland, the mean of the coldest month being 38° 3', and of the warmest 59° 4'. A great deal of rain falls in Scotland, but very unequally; for on the east coast it ranges from 22 to 28 inches, whereas on the west coast and the Hebrides, it ranges from 30 to 44 inches. The average fall of rain in Edinburgh is 23½ inches, and in Glasgow about 29·65 inches. Excess of humidity, and the occurrence of heavy rains in August, September, and October, and of cold piercing east winds, especially along the east coast in the months of April, May, and the first half of June, are the great drawbacks in the climate of Scotland.' Compared with that of England, it is cold, cloudy, and wet; yet the temperature is not liable to such great extremes as that of either England or France, seldom falling below 25° Fahrenheit, or rising above 65°, the annual average being from 45° to 47°. The summer is uncertain, and often comprehends many consecutive weeks of ungenial weather; but, on the other hand, the winters—considering the latitude—are rarely severe, and often include many agreeable days, and even weeks.

### BOTANY AND ZOOLOGY.

The plants and animals of the country are, generally speaking, specifically the same as those of England, but exhibit somewhat more of a boreal character, as might be expected from the higher latitude and altitude of the land. Thus many of the ornamental shrubs and exotic trees which adorn the lawns of England will not flourish unless in very favoured localities; the usual forest-trees attain to perfection in the Lowlands, but many of them are unable to resist the rigorous climate of the Highlands, where the native Scotch pine and birch grow at a very high elevation. But even there a limit is found to all timber-trees; and large tracts of the mainland, and almost all the islands, are utterly treeless. The common cultivated grains are grown profitably, and to great extent, in the Lowlands; but oats, and a coarse variety of barley (*bigg*), are the only cereals grown in the Highlands and islands.

The native animals present similar differences. The stag, roe, and wild cat are thoroughly *feræ naturæ* on the northern hills; game-birds, as the partridge, grouse, ptarmigan, woodcock, blackcock, capercaillie—are peculiarly abundant in the same localities; Scotland possesses fewer species of fresh-water fish, but has the salmon, trout, pike, and perch in greater abundance than in England; many of the marine animals, cetaceæ, herring, ood, and other white fish, are more plentiful;

while others, as the pilchard, mackerel, and white bait, are scarcely known. The domesticated animals are now for the most part crossed with the larger and finer varieties of the south; but Scotland still retains several breeds peculiarly suitable to its soil and climate—as the Clydesdale, Galloway, and Shetland breeds of the horse; the Ayr, Fife, Angus, and West Highland breeds of the ox; the Cheviot sheep of the south, and the black-faced hardy wether of the north.

### PEOPLE—POPULATION.

The population of Scotland is readily divisible into two great sections—the Lowlanders or Scotch proper, and the Highlanders or Celts. The former, like the English, are of the Teutonic race, but consist of an admixture of Picts, Saxons, Danes, and Scandinavians. They occupy the whole of the Lowlands and the eastern coast-fringe of the Highlands, speaking a variety or dialect of the English language. They are described generally as a tall, large-boned, and muscular race, with features less round and soft than the modern English, and with a larger and more elongated cranium. The Highlanders, on the other hand, are of Celtic origin; and though their language is gradually giving way to that of the Lowlanders, in other respects they retain all the peculiarities of that race.

The Scottish character exhibits a considerable share of both energy and perseverance. It may safely be said that a country with so many physical disadvantages could never have been brought into such a condition as respects rural husbandry, nor, with all the advantage of the English connection, been made so prosperous a seat of both manufactures and commerce, if the people had not been gifted in a high degree with those qualities. A disposition to a frugal and careful use of means is also abundantly conspicuous in the Scotch. The poorest poor, at least in rural districts, are in few instances of such improvident habits as to exhibit that destitution of furniture, clothing, and tolerable house accommodation, which meets the eye almost everywhere in Ireland. Caution, foresight, and reflection, may be said to enter largely into the Scottish character. Under the influence of these qualities, they are slow, and sometimes cold in speech, and are therefore apt to appear as deficient in frankness and generosity. These, however, are in a great measure only appearances. That *perfidium ingenium*, or fiery genius attributed to them by Buchanan, is still a deep-seated characteristic of the people. On subjects which they regard as important, they sometimes manifest this excitability in a very striking manner; as, for instance, in their almost universal rising against Charles I. in defence of their favourite modes of worship and ecclesiastical polity. Generous affections, in which, as compared with the English, the Scotch might appear deficient, perhaps only take in their case somewhat different directions. They cherish more than most people a feeling of attachment for their native country, and even the particular district and spot of their birth; for their remote as well as immediate kindred, and for everything which reminds them of what is honourable in the doings of those who went before them. A strong sense of religion is a conspicuous feature in the Scottish national character; clear, however, from all regard to external, and what appear to them unimportant things connected with it. There is no country where a more decent attention is paid to the Sabbath than in Scotland. It may at the same time be remarked, that their religion is more doctrinal than directly venerative or sentimental—a peculiarity which may be traced in the plainness of their forms of worship, as either its cause or its effect. There is a considerable tendency in the Scottish intellect to argumentative reasoning, and this shows itself in the service in their churches as well as in their philosophical literature. The domestic virtues flourish in much the same degree in Scotland as in England; but the humbler classes in North Britain are not quite so remarkable for cleanliness as the lower English. The

CHAMBERS'S INFORMATION FOR THE PEOPLE.

rural labouring-classes are distinguished for their steady industry and decant conduct; and it is only perhaps amongst the lower orders in large towns that much moral deterioration has taken place. For centuries the adventurous disposition of the Scotch has been remarkable. An immense number of young persons every year leave their native country to push their fortune in the busier English cities, in public employment in India, in the colonies, or in other parts of the world. These persons have generally a tolerable education in proportion to their rank and prospects; and being found possessed of steadiness, fidelity, and perseverance, they rarely fail to improve their circumstances. We are here reminded of the advantage which Scotland has long enjoyed in the possession of a universally-diffused means of elementary instruction. This, though in some respects over-estimated, has at least insured that nearly every person reared in Scotland is not without some tincture of literature. (See No. 62, p. 180, for details respecting the religious and educational establishments of Scotland.)

NATIONAL INDUSTRY.

The productive industry of the country has increased prodigiously within the current century. *Agriculturally*, the value of the land has been more than doubled within the last seventy years, and this in spite of those obstacles which render so much of the surface unapproachable by the plough. The system of farming, under leases of nineteen years, is at once exact and scientific, aided by the best-constructed machines, and by chemical skill in soils, drainage, and the application of artificial manures. Taking into account crops, pastures, gardens, and woodlands, the total value of the land produce has been estimated at £29,327,000, independent of the unascertained value of cattle, sheep, wool, and dairy produce. Generally speaking, the *fisheries* of Scotland are profitably conducted, the salmon of the rivers and estuaries yielding from £120,000 to £160,000 annually; the herring-fishery producing from 600,000 to 660,000 barrels; the cod and white-fish fisheries very large, but unknown amounts; oyster and lobster-dredging also of considerable value; besides minor fishings, and the accidental strandings of large shoals of the smaller cetacea.

The *manufacturing* progress of Scotland has been extremely rapid and gratifying. The cotton manufacture, valued at £5,000,000 annually, chiefly centres in Glasgow and Paisley; the woollen at Hawick, Galashiels, Kilmarnock, and Aberdeen; linen in the towns of Forfar and Fife; papermaking in Mid-Lothian and Fife; gloves, hosiery, hats, and minor soft wares, in several localities. In iron-founding, Scotland has now a large and prosperous trade, principally in the counties of Lanark and Stirling; steam-engines and machinery of every description are extensively constructed; and some of the iron ship-yards on the Clyde are unrivalled. Typefounding, printing, and publishing, are largely carried on in Edinburgh. Leather, chemicals for the bleacher, dyer, &c., glass-wares, soap, and the like, are the other principal manufactured products. *Distilling* and *brewing* constitute a considerable portion of the trade of the country—the whisky and ales so produced having long had an extensive celebrity.

The *commerce* has more than kept pace with the manufactures; the mercantile navy of Scotland, exclusive of passenger steamers and the like, numbering 3600 vessels, with an aggregate burthen of 440,000 tons. In 1843 there were 128 steamers, with a burthen of 19,422 tons. The *internal communication* of the country is carried on by first-rate macadamised roads; by canals, of which there are 150 miles; and by railways, of which about 600 miles are constructed, or in course of construction. (See No. 62, p. 183.)

GOVERNMENT—ADMINISTRATION.

The *government* of the country, since the Union in 1707, has been identical in its leading features with that of England. (See No. 62, p. 177.) The law-courts, 228

however, both civil and criminal, are much more simple and efficient than those of the sister kingdoms. For administrative purposes, Scotland is divided into 33 shires or sheriffdoms, comprising 1023 parishes. In the following table, the counties are arranged alphabetically, with their areas in statute acres, population according to census 1841, and county towns:—

Counties.	Acres.	Population.	County Towns.
Aberdeen, - - -	1,254,400	192,268	Aberdeen.
Argyle, - - - -	3,002,560	97,140	Inverary.
Ayr, - - - - -	604,960	164,622	Ayr.
Banff, - - - - -	412,800	50,076	Banff.
Berwick, - - - -	282,880	34,427	Greenlaw.
Bute, - - - - -	103,040	15,695	Rochay.
Caitness, - - - -	489,680	36,197	Wick.
Clackmannan, - -	80,796	19,116	Alloa.
Cromarty, - - - -	162,840	11,862	Cromarty.
Dumarton, - - - -	145,920	44,286	Dumarton.
Dumfries, - - - -	801,920	72,825	Dumfries.
Edinburgh, - - - -	226,560	225,623	EDINBURGH.
Elgin, - - - - -	305,720	34,994	Elgin.
Fife, - - - - -	296,880	140,810	Cupar.
Forfar, - - - - -	568,320	170,400	Forfar.
Haddington, - - -	174,080	35,781	Haddington.
Inverness, - - - -	2,594,560	97,615	Inverness.
Kincairdine, - - -	242,200	38,052	Stonehaven.
Kinross, - - - - -	46,080	8,763	Kinross.
Kirkcudbright, - -	525,760	41,009	Kirkcudbright.
Lanark, - - - - -	604,880	427,112	Lanark.
Linlithgow, - - - -	76,800	26,948	Linlithgow.
Nairn, - - - - -	124,800	9,218	Nairn.
Orkney & Shetland,	819,200	60,796	Kirkwall.
Peebles, - - - - -	294,160	10,820	Peebles.
Perth, - - - - -	1,656,320	138,151	Perth.
Renfrew, - - - - -	144,000	154,756	Paisley.
Ross, - - - - -	1,682,560	67,618	Tain.
Roxburgh, - - - -	467,600	46,008	Jedburgh.
Selkirk, - - - - -	166,320	7,889	Selkirk.
Stirling, - - - - -	318,960	82,179	Stirling.
Sutherland, - - - -	1,122,560	24,666	Dornoch.
Wigton, - - - - -	288,960	39,179	Wigton.
Total, - - - - -	18,944,000	2,620,610	

*Note.*—The word Scotland is of dubious and disputed origin; all that is known for certain being, that the term *Scoti* was applied to the Pictish inhabitants of the western corner of the country so early as the second century. The topographical nomenclature is chiefly Celtic and Saxon; hence the frequent occurrence of the following prefixes and terminations:—*Ben*, mountain; *brae*, highland; *fell*, mountain; *law*, mount; *dun*, hill; *cairn*, heap of stones, or stony hill; *crag*, rocky height; *ard* or *aird*, headland or height; *ness*, promontory; *strath*, large valley; *glen*, steep narrow valley; *blair*, open field or plain; *aber*, river, *suchter*, at the mouth or confluence of a river; *cell*, cell or church; *bal*, dwelling or town; *ken*, *kin*, head or height; *loch*, inland; *more*, large; and so on.

REMARKABLE SCENERY—NATURAL CURIOSITIES.

The comparatively irregular surface of Scotland, or, as a geologist would remark, its being more generally formed of the primitive and early rocks, has caused the existence of much picturesque and romantic scenery, the attractions of which have been greatly heightened of late years by the works of the native poets and novelists, particularly Sir Walter Scott. The Highlands may be said to form one wide tract of such scenery, though some parts are considerably more beautiful than others. The finer scenery in Scotland generally lies along the beds of lakes or the vales of rivers. The chief tracts are the following:—

Lower Perthshire.

The *Trossachs* and *Loch Katrine*.—This is a beautiful district, situated at the distance of little more than 25 miles from Stirling, and remarkable as the scenery of Scott's 'Lady of the Lake.' It may be said to commence at the large Lowland village of Callander, which is only 16 miles from Stirling. This village lies in the bosom of the valley of the Teith, with lofty hills on all sides except the east, and apparently occupying the last patch of level ground before the traveller enters the Highlands. The surrounding scenery is wor-

## SCOTLAND.

thy of being explored; two places, in particular, should be visited. The first is the *Fall of Braeklin*, situated among the hills, at the distance of a mile and a-half in a north-easterly direction from the village. It consists of a series of cascades formed by the impetuous rushing of a mountain stream, termed the Keltie, down a rugged rocky ravine. Each cascade is from 8 to 10 feet in depth, and altogether the Falls may measure upwards of 100 feet, before they finally settle in a profound receptacle at the bottom. Above the chasm there is thrown a rustic foot-bridge, from which the view of the Falls, when the water is large, is particularly grand.

The other place to which we would draw attention is the *Pass of Leny*. This is a narrow opening, about a mile to the north-west of the village, which affords access, as its name imports, from the Low country into the wild recesses of the Highlands. While the vale of the Teith continues towards the west, the road to the Pass of Leny strikes off in a north-westerly direction. Skirted with waving woods, and bound in by lofty mountains, this is a scene of great sublimity. A rapid river, which issues from the mountain lake denominated Loch Lubnag, hurries through the narrow vale over a series of little cascades, yielding a music harsh and wild, in strict keeping with the ruggedness of the scene. The road leads along the brink of Loch Lubnag, to the small parish village of Balquidder, in the church-yard of which the grave of the celebrated freebooter Rob Roy is still pointed out.

The road towards the Trosachs pursues a tortuous line along the base of a mountain-range, skirting the north side of the valley. In the bottom of the vale lie in succession two long stripes of water, or lakes, called Loch Vennachar and Loch Achray. Immediately before approaching the eastern extremity of the last of these lakes, which is by much the smallest, a road leads off to the right into the vale of *Glenfinlas*—a tract of ten miles in extent, formerly a royal hunting-forest, destitute of the smallest symptom of habitation or of cultivation, and which any one who wishes to have a complete idea of an Ossianic desert, in all its sterile and lonely wildness, may be recommended to traverse. The bridge crossing the stream which descends from this vale, is called the Bridge of Turk, from the circumstance, it is said, of a wild boar, which had done much mischief in the neighbourhood, having been slain at the place in times long bygone.

On coming to the head of Loch Achray, you approach the Trosachs. At this point is situated an inn having a strange Gaelic name, sounding something like Ard-kencrocran. This is the last human habitation on the route, and here travellers usually quit their vehicles in order to walk the remainder of the distance; the road, however, will accommodate a chaise to the verge of Loch Katrine. The Trosachs is simply a concluding portion of the vale, about a mile in extent, and adjoining to the bottom of Loch Katrine. From the tumultuous confusion of little rocky eminences, of all the most fantastic and extraordinary forms, which lie throughout the bottom of the vale, and are everywhere shagged with trees and shrubs, nature here wears an aspect of roughness and wildness, of tangled and inextricable boskiness, totally unexampled. The valley being contracted, hills, moreover, rise on each side to a great height, which, being entirely covered by birches, hazels, oaks, hawthorns, and mountain ashes, contribute greatly to the general effect. The meaning of the word *Trosachs* in some measure describes the scene—a rough or *bristled* piece of territory. The author of the 'Lady of the Lake' has described it as 'a wildering scene of mountains, rocks, and woods, thrown together in disorderly groups.'

At the termination of the Trosachs, Loch Katrine commences: it measures about 10 miles in length, and is justly reckoned one of the most beautiful in Scotland. Its principal charm consists in the singular rugged wildness of its mountainous sides, and its pretty rocky islets, rising to a considerable height out of the water, and tufted over with trees and shrubs. Near

the eastern extremity of the lake there is precisely such an island as that which is described in the poem as the residence of the outlawed Douglas and his family. To fulfil the wishes of the imagination—if such a phrase may be used—Lady Willoughby D'Eresby, the proprietrix of the ground, has erected upon the island a sort of tower or cottage, such as that which the said family occupied; and he must be a traveller of more than ordinary churlishness who could refrain from indulging in the pleasing deception thus created.

The view of the lake, on approaching it on the east, is rather confined; but from the top of the rocky and woody mount above, the prospect is more extensive, and of that singular beauty which Scott in his 'Lady of the Lake' has described:—

————— 'Gleaming with the setting sun,  
One burnished sheet of living gold,  
Loch Katrine lay beneath him rolled,  
In all her length far-winding lay,  
With promontory, creek, and bay,  
And islands that, empurpled bright,  
Floated amid the liveller light,  
And mountains that like giants stand,  
To sentinel enchanted land.  
High on the south, huge Ben-venue  
Down on the lake its masses threw—  
Crags, knolls, and mounds, confusedly hurled,  
The fragments of an earlier world;  
A wildering forest feathered o'er  
His ruined sides and summit hoar;  
While on the north, through middle air,  
Ben-an heaved high his forehead bare.'

*Loch Earn*.—The beautiful scenery connected with this lake may be said to commence at Comrie, a village about 20 miles to the west of Perth, and remarkable as the place of all others in the United Kingdom where earthquakes take place most frequently. The vale of the Earn is here, and even lower down, full of natural and acquired beauty. Passing upwards towards the lake, the scenery becomes more interesting at every step. At that part of the vale which adjoins to the bottom of the lake, its character is similar to that of the Trosachs, at the corresponding extremity of Loch Katrine, though less minutely rugged and picturesque. Passing through the extensive grove at the bottom of the valley, now within sight and hearing of the ever-glancing and ever-murmuring Earn, and then beyond both, as the road approaches and recedes from the water-side, the traveller gets frequent broken glimpses of the grand and wildly-serrated tops of the neighbouring mountains, whose sides present a strange piebald mixture, by no means deficient in effect, of alternate bare crag and incumbent verdure—a beautiful confusion, indeed, of gray and green—relieved occasionally by the darker branches of the birch and weeping-ash.

Loch Earn extends 9 miles in length, and generally about 1 mile in breadth. It is thus described by Dr Macculloch:—'Limited as are the dimensions of Loch Earn, it is exceeded in beauty by few of our lakes, as far as it is possible for many beauties to exist in so small a space. I will not say that it presents a great number of distinct landscapes adapted for the pencil; but such as it does possess are remarkable for their consistency of character, and for a combination of sweetness and simplicity, with a grandeur of manner, scarcely to be expected within such narrow bounds. Its style is that of a lake of far greater dimensions; the hills which bound it being lofty, and bold, and rugged, with a variety of character not found in many of even far greater magnitude and extent. It is a miniature and model of scenery that might well occupy ten times the space. Yet the eye does not feel this. There is nothing trifling or small in the details; nothing to diminish its grandeur of style, and tell us we are contemplating a reduced copy. On the contrary, there is a perpetual contest between our impressions and our reasonings: we know that a few short miles comprehend the whole, and yet we feel as if it were a landscape of many miles—a lake to be ranked among those of first

order and dimensions. While its mountains thus rise in majestic simplicity to the sky, terminating in bold, and various, and rocky outlines, the surfaces of the declivities are equally bold and various; enriched with precipices and masses of protruding rock, with deep hollows and ravines, and with the courses of innumerable torrents which pour from above, and, as they descend, become skirted with trees till they lose themselves in the waters of the lake. Wild woods also ascend along their surface, in all that irregularity of distribution so peculiar to these rocky mountains; less solid and continuous than at Loch Lomond; less scattered and romantic than at Loch Katrine; but from these very causes, aiding to confer upon Loch Earn a character entirely its own.' In passing along Loch Earn, it is recommended to go by the road on the south side. The house of Ardvoldrich (Stewart, Esq.), occurs about mid-way; its name recalls the memory of Stewart of Ardvoldrich, a partisan of Montrose, who killed his friend Lord Kilpont in the royalist camp at Collace, September 5, 1644—the incident on which Scott founded his 'Legend of Montrose.' The woody promontories which here project into the lake are remarkably beautiful. About a mile and a-half from the west end of the lake occur the castle and Falls of Edinample, a scene of distinguished loveliness, such as people, in the spirit of compliment, say might give occasion to a volume, and which, rather strange to tell, has actually done so. The upper extremity of this beautiful lake, where the general merits of the scenery may be said in some measure to be condensed and combined, is enlivened by the little village and inn of Loch Earn Head.

**Middle Perthshire.**

**Dunkeld.**—This small town, so celebrated for the fine scenery in its neighbourhood, is situated on the north bank of the Tay, at the distance of 15 miles from Perth, and 24 from Kenmore. Nestling beneath steep and woody mountains, with a noble river running in front, across which there is an elegant bridge, the first view of Dunkeld, in approaching it from the south, is very striking. The village consists of two small streets, in which are two excellent inns, affording extensive accommodation for the tourists who flock hither in summer. At Dunkeld, attention is called to the venerable remains of a cathedral, and the Duke of Athole's mansion, styled Dunkeld House; but our present business is with the natural scenery. Most of this is in the pleasure-grounds connected with the mansion.

**Craig-y-Barns**, a lofty hill, wooded to the top, which rises behind the house, is a resort of tourists for the sake of the magnificent view which it commands. They are also conducted by guides to the scenery of the *Bran*, which joins the Tay on its opposite bank near the village of Inver—the birthplace and usual residence, it may be mentioned, of the late Neil Gow, so famous wherever Scottish music is known, at once for his performance on the violin and his excellent compositions. Near this place the tourist is conducted into a tasteful hermitage or summer-house, named Ossian's Hall, where he sees before him a picture representing the aged Ossian singing to some females the tales 'of the days that are past,' while his dog, his hunting-spear, and bow and arrows, lie at his side. On a sudden, this picture slips aside, and discloses to the view of the surprised stranger a splendid cataract, which dashes down the rocks immediately opposite to the building, and the waters of which are reflected from a range of mirrors disposed around the hall. To use the words of Dr Clarke, 'The whole cataract foams at once before you, roaring with the noise of thunder. It is hardly possible to conceive a spectacle more striking. If it be objected that machinery contrivance of this sort wears too much the appearance of scenic representation, I should reply, that as scenic representation I admire it, and as the finest specimen of that species of exhibition, which, doubtless, without the aid of such a deception, would have been destitute of half the effect it is now calculated to produce. A little below this edifice, a

simple, but pleasing arch is thrown across the narrow chasm of the rocks, through which the river flows with vast rapidity. About a mile higher up the *Bran* is the *Rumbling Bridge*, thrown across a chasm of granite, about fifteen feet wide. The bed of the river, for several hundred feet above the arch, is copiously charged with massive fragments of rock, over which the river foams and roars like the waters at Ivy Bridge in Devonshire. Approaching the bridge, it precipitates itself with great fury through the chasm, casting a thick cloud of spray or vapour high above the bridge, and agitating by its fury even the prodigious masses which form the surrounding rocks. Few objects will more amply repay the traveller for his trouble of visiting them, than the woody precipices, the long, winding, shady groves, the ruins and cataracts of Dunkeld.' In the angle formed by the junction of the *Bran* and *Tay* rises *Craig Vanean*, a broad shadowy mass of firs, reared against the sky. A neighbouring eminence obtains the name of the *King's Seat*, in consequence of King William the Lion having been in the habit of stationing himself upon it, in order to shoot at the droves of deer which his attendants caused to pass through the adjacent hollows.

**Aberfeldy, Kenmore, and Killin.**—Tourists frequently proceed from Dunkeld along the bank of the *Tay*, in order to comprehend the tract of scenery here indicated. **Aberfeldy**, a village not in itself remarkable, is celebrated for the fine cataract, formed by a small tributary of the *Tay*, in its neighbourhood, and near the House of Moness. The tourist is conducted by a guide along the thickly-wooded banks of this rivulet, till, about a mile from the village, he reaches the first of the celebrated waterfalls of Moness. A little sub-tributary rill here pours, in a series of cascades, down the side of the glen, amidst a natural scene of the greatest beauty. A little farther up the main dell, the rivulet pours along a steep natural staircase, of a hundred feet in perpendicular descent, the sides of which rise abruptly and ruggedly, clothed with the most beautiful natural plants. This scene is described by Burns in one of his well-known songs:—

'The braes ascend like lofty wa's,  
The foaming stream deep-roaring fa's,  
O'erhung wi' fragrant spreading awns,  
The birks of Aberfeldy.

The hoary cliffs are crowned wi' flowers;  
White o'er the linn the burnle pours,  
And, rising, weets wi' misty showers  
The birks of Aberfeldy.'

At a third cataract, higher up, the pathway crosses the stream, and descends on the other side of the dell. Pennant, the tourist, describes the Moness Falls as 'an epitome of everything that can be admired in the curiosity of waterfalls.'

A ride of six miles along the *Tay* brings the traveller to *Kenmore*, a village of famed beauty, situated at the east end of Loch *Tay*, at the place where the river issues from that sheet of water. This is one of the chief stages or points in the tour of Perthshire, and it is provided, accordingly, with a good inn. Lofty hills ascend on each side; on one hand there is a noble lake; on the other, towards *Aberfeldy*, stretch the splendid grounds around *Taymouth Castle*, the seat of the Marquis of Breadalbane. This magnificent house—truly worthy of the great chief and land-proprietor who owns it—is about a mile to the east of *Kenmore*, the exterior gateway of the park opening from the street of the village. It is a dark-gray castellated edifice, of modern aspect, situated in the low ground beside the river, with a beautiful backing of woody hills rising behind it. A guide is required to introduce a stranger to all the beauties of the *Taymouth Park*, among which the most remarkable is the *Berceau Walk*, a grand avenue of 450 yards in length, which reminds one of some lofty cathedral, 'casting a dim religious light.'

**Loch Tay** is a fine sheet of water, 15 miles in length, lying between two ranges of hills. In the centre of the north-west side rises *Ben Lavers*, to the height

of 4015 feet. An island near Kenmore formerly contained a priory of Augustines, founded by Alexander I. in the year 1122. Here his queen, Sybilla, daughter of Henry I. of England, was buried. Loch Tay is remarkable, like some other Scottish lakes, for having been on several occasions greatly agitated at the moment of the occurrence of earthquakes in distant parts of the world. It is from 15 to 100 fathoms deep. There is a road on each side to Killin, the distance being sixteen miles. Both abound alike in fine scenery, though, by pursuing that along the south side, a view will be obtained of the lofty Ben Lovers, which will scarcely be seen in such perfection on the opposite side. The mixture of wood, rock, and cultivated field which the traveller finds skirting Loch Tay, will surprise him with its happy effect. The system of minute farms prevails here in all its pristine rigour, and a vast number of rude and picturesque cottages necessarily enter into the composition of the landscape.

*Killin*, a straggling little village, situated in the low vale at the head of the loch, is celebrated for the varied beauty of its scenery. Here two rivers, the Dochart and the Lochy, come down out of different glens, and join their waters with each other and with the lake. The vale of the latter is peculiarly beautiful; but that of the Dochart, extending up to Tyndrum, upon the great west road, is only stern and wild. On arriving at the town, the Dochart breaks over a strange expanse of table-rock in a thousand little cascades; so that the traveller, who crosses a bridge just at the place, is bewildered, as he looks around, with the flashing and sparkling water which everywhere meets his eye. 'Killin,' says Dr Macculloch, 'is the most extraordinary collection of extraordinary scenery in Scotland, unlike everything else in the country, and perhaps on earth, and a perfect picture-gallery in itself, since you cannot move three yards without meeting a new landscape. A busy artist might here draw a month, and not exhaust it. It is indeed scarcely possible to conceive so many distinct and marked objects collected within so small a space, and all so adapted to each other, as always to preserve one character, and at the same time to produce so endless a number of distinct and beautiful landscapes. To find, however, all that Killin has to give of this nature, it is necessary to pry about into corners, like a cat; as the separate scenes are produced by very slight changes of position, and are often found in very unexpected places. Fir-trees, rocks, torrents, mills, bridges, houses—these produce the great bulk of the middle landscape under endless combinations; while the distances more constantly are found in the surrounding hills, in the varied woods, in the bright expanse of the lake, and the minute ornaments of the distant valley, in the rocky and bold summit of Craig Cailleach, and in the lofty vision of Ben Lovers, which towers like a huge giant to the clouds, the monarch of the scene.'

On the north-west shore of Loch Tay, near Killin, stands the mouldering ruin of Finlarig Castle, built by Sir Colin Campbell of Glenurchy between 1513 and 1523, and the seat of the family before their removal to Balloch or Taymouth. 'We observe also,' says a traveller, writing in 1802, 'situated on a plain at the west end of the lake, a neat but small mansion (Kinneil), belonging to Mr Mc'Nab, the chieftain of that name. The family burial-ground, *Inish-Mhuil*, close by the house, is pointed out to the stranger as a place of singular beauty. It undoubtedly is such, and is highly calculated to raise ideas of tenderness and sorrow; as an insulated grove of tall pines, whose solemn aspect and deep silence are in fine harmony with the waters around it, the blue expanse of the lake calm and unruffled, and the height of the mountains that rise from its margin, are objects well suited to correspond with the belief that Fingal sleeps here in the dust.'

#### Dumbartonshire.

A tract of beautiful scenery extends through this county, from the banks of the Clyde along those of

the Leven, and including Loch Lomond, the largest, and probably most beautiful of our British lakes:—

At the starting-point, in an angle formed by the confluence of the Leven and Clyde, is a basaltic mass, shooting up to the height of 560 feet above an alluvial plain. This affords a site for the celebrated *Dumbarton Castle*, a romantic fortress, noted in Scottish history, and one of four kept in repair in terms of the Act of Union. Passing the town of Dumbarton, the tourist proceeds upwards along the vale of the Leven, a scene of singular beauty, filled with thriving villages and elegant mansions. The road, at the distance of two miles from the town, passes the old mansion-house of Dalquharn, in which, in the year 1721, the author of 'Roderick Random' first saw the light. Archibald Smollett, the father of the novelist, was the fourth son of Sir James Smollett of Bonhill, and having married against his father's will, was residing here, in possession of one of the farms of the family property, at the time of the birth of his illustrious child. In a field on the opposite or west side of the road, there is an obelisk to the memory of the novelist, erected and inscribed by his cousin-german, James Smollett of Bonhill. Immediately beyond, the road passes through the populous modern village of Renton, occupied by persons engaged in the neighbouring bleachfields, and taking its name from that of a lady married into the Smollett family. This, and another similar village named Alexandria, a little farther on, together with the appearance of various works on a large scale scattered over the landscape, testify that industry of a different kind from that which becomes 'embrowned with toil,' has taken possession of the limpid waters of the Leven, to which, therefore, the beautiful ode of Smollett is no longer strictly applicable. Bonhill, the ancient seat of the novelist's family, is opposite to Alexandria. Several other mansions of handsome appearance enliven the road before it arrives at *Balloch* (at the foot of the lake), a small village and inn at the southern extremity of Loch Lomond, and  $4\frac{1}{2}$  miles from Dumbarton.

*Loch Lomond* measures 23 miles in length from north to south; its breadth, where greatest, at the southern extremity, is 5 miles, from which it gradually grows narrower between the enclosing hills, till it terminates in a mountain streamlet. The whole aqueous surface is calculated at  $81\frac{1}{2}$  square miles, or 20,000 English acres, and it is studded by above thirty isles, mostly at the southern extremity. These islands, together with the shores of the lake, are in general clothed with dark wood, which gave occasion to a distinction very judiciously drawn a few years ago by a Swiss tourist between Lausanne and Loch Lomond: 'Our lake,' he said, 'is the fair beauty—yours the black.' The first isle that occurs is a long narrow one named *Inch Murrin*, at the southern extremity of which there is an old ruined fortalice called Lennox Castle, said to have formerly been a residence of the Earls of Lennox. This isle is now the property of the Duke of Montrose, who employs it for the keeping of deer. In succession from Inch Murrin, towards the north-east, occur *Inch Cro* (the Isle of Cattle), *Torr Inch* (the Wood Isle), and *Inch Caillach* (the Island of Women, having been the site of a nunnery). On the south side of Inch Caillach is *Clar Inch* (Flat Island), a very little member of the archipelago; at the north end the ruins of a castle are to be seen under water, testifying that the surface of the lake must have risen in the course of ages. Inch Caillach, which formerly gave name to the parish of Buchanan, and was the burial-place of the Macgregors, has on its north side *Inch Fadd* (Long Island), which bears grain and pasture, and near which is *Ellendar-roch* (the Small Rugged Island). Another group to the northward stretch between the peninsula of Rosodoe, on the west side of the lake, and Strathcahal Point, on the east. *Inch Tavanagh*, the first in this group, and which derives its name from having once been the residence of a monk, contains 150 acres, partly covered with wood; it is the highest island in the lake. At a little distance to the south, the ruins of Galbraith

Castle, once the residence of a family of that name, start up from the water. To the east of Inch Tavanagh are *Inch Conagan*, covered with oak and fir, and *Inch Moan*, a low isle correctly described by its name, which signifies the island of moss. Still farther to the east are *Inch Cruin*, on which is an asylum for insane persons, and *Buc-inch* (Goat-Island). North from these lies *Inch Lonaig*, 150 acres in extent, and bearing many old yews, formerly of great use in furnishing the materials of bows and arrows. Of the whole thirty islands, the remainder are unimportant. South of Luss, the depth of the lake is rarely more than 20 fathoms: in the northern and narrower part it ranges from 60 to 100 fathoms; and in the places where deepest, never freezes. In ancient times Loch Lomond was famed for three wonders—'waves without winds, fish without fins, and a floating island.' The first phenomenon is attributed to a peculiar atmospheric effect, not easily described, but which has also been observed on the Cumberland lakes; vipers swimming from island to island account for the second; the floating island is supposed to have been a detached fragment of moss, or a matted mass of aquatic plants, which ultimately fixed itself near the west side of Inch Conagan.

Loch Lomond is skirted on the west side by the road from Dumbarton to Inverary. Less than a mile from the lower end of the lake, this road passes Cameron House, long the seat of the Smolletts of Bonhill, and described as such in the novel of 'Humphry Clinker,' where we have many panegyrics upon its scenery. A little farther on, the fine modern mansion of Belretiro overhangs the road upon the left. Here, through a fine vista, appears the polished expanse of Loch Lomond, its large islands, and the soft hills in the distance—a view that never fails to arrest the attention of the traveller. The objects that crowd into this scene are so finely diversified in form, in situation, and in colour, as to compose a picture at once beautiful and impressive. At the seventh mile-stone, upon the left, is the mansion of Arden, environed with woods, and placed at the bottom of a lofty hill called *Dunfion*, or the Hill of Fingal, tradition reporting it to have been one of the hunting-seats of that hero. Somewhat further on, and passing Nether Ross upon the left, the traveller crosses a small river called the Water of Fruin, which falls into the lake. It rises in *Glenfruin*, or Vale of Lamentation, so called, it is said, from a dreadful slaughter of the Colquhouns by the Macgregors in 1602, and on account of which the Macgregors were for nearly two centuries unceasingly persecuted by government. The promontory of *Rosadoe*, which forms a beautiful situation for the mansion of the same name, is then passed; after which a scene of uninterrupted beauty continues all the way to Luss, twelve miles from Dumbarton.

*Luss*, a delightful little village, on a promontory which juts into the lake, is much resorted to in summer, on account of its being a convenient station for tourists in search of the picturesque. One of the finest points for enjoying the scenery of Loch Lomond and the environs of Luss, is Stronehill, to the north of the village. At this point, about one-third of the way up a lofty hill, the whole breadth of the lake is spanned by the eye, including

— 'all the fairy crowds  
Of islands which together lie,  
As quietly as spots of sky  
Among the evening clouds.'

From this point the isles appear distinctly separated from each other, but not so much so as to give the idea of a map or bird-eye view, which a higher point of view would undoubtedly present. The prospect is bounded on the south by the distant hills which intervene between Loch Lomond and the Clyde, and which here appear, in comparison with the mountains around, to be only gentle swells; the Leven, its vale, the rock of Dumbarton, and even the surface of the Clyde, are in the same direction conspicuous. Towards the east, the

vale of the Endrick, its principal seats, the obelisk erected to the memory of Buchanan at Killearn, and the Lennox Hills, are also distinctly visible. Turning to the north, the lake is seen to wind and recede far away among the mountains.

At *Inveruglas*,  $3\frac{1}{2}$  miles beyond Luss, there is a ferry to Rowardennan Inn, the usual starting-point for those who desire to ascend to the top of *Ben Lomond*. This mountain, situated in the county of Stirling, is 3240 feet above the level of the lake, which is 22 above the level of the sea. At Rowardennan, when looking northward, it almost completely fills up the view. It consists in three great stages, each rising above the other; these, again, are divided into a number of lesser swelling knolls, some of which are covered with heath and crags, while others are verdant and smooth. The distance from the inn to the top of the mountain is six miles of a continued ascent, which in general requires about three hours. From the summit, a varied and most extensive prospect opens upon the eye in every direction. The lake, lately contemplated with so much pleasure, now appears a small pool, and its rich and diversified islands as so many specks upon its surface. Beyond it, and to the left, appear the vale of the Endrick, the distant county of Lanark, its towns, and the mountain of Tinto; directly south, the outlet of the lake, the river Leven, its winding and rich banks, the Castle of Dumbarton, and the counties of Renfrew and Ayr; nearly in the same direction, the Firth of Clyde, the rock of Ailsa, the islands of Arran and Bute, with the more distant Atlantic. The coasts of Ireland and the Isle of Man are, when the atmosphere is clear, within the boundary of the view. To the east are seen the counties of Stirling and the Lothians, with the windings of the Forth, and the castles of Stirling and Edinburgh. The prospect to the north is marked by grandeur alone. Immense mountains, piled, as it were, above each other, and extending from the borders of Stirlingshire to the western ocean, with the indentations of the coast on one side, and the lakes of Perthshire on the other, form altogether a scene which may be conceived, but which cannot be properly described.

Ben Lomond has this remarkable advantage as a hill—that it is not overcrowded or crowded up with surrounding hills. It seems to be sole monarch of a vast undisturbed territory. Nowhere, therefore, is there a better idea to be obtained of the Highland country than on its summit. The mountain itself, besides, affords a great variety of scenery. To the south it stretches out into a slope of a very gentle declivity. The north side is awfully abrupt, and presents a concave precipice of many hundred yards in depth. He must possess firm nerves who can approach the brink and look down unmoved. The rock is 2000 feet in sheer descent.

About  $4\frac{1}{2}$  miles to the north of Inveruglas, the Dumbarton and Inverary road reaches the lonely but comfortable inn of Tarbert, where there is also a ferry by which Ben Lomond may be approached. At this inn the road leaves the shore of the lake, and proceeds to the westward by the head of Loch Long, and so into Argyleshire. On the heights above, beside the way to Loch Katrine, are the remains of Invermaid Fort, erected by the government in 1713 to check the turbulence of the Macgregors: near it is a little burial-ground, in which the garrison had interred their dead, and containing one or two monuments, which have long forgot to tell the familiar tale confided to them. The fort was taken by Rob Roy in 1716, but afterwards regained and re-established. It is said that the amiable General Wolfe at one time resided in it.

#### Firth of Clyde—Argyleshire.

This is a tract of scenery much admired and visited, on account of its presenting a fine combination of inland seas with islands of varied surface and chains of rugged mountains:—

The Clyde expands into an estuary a little way below Dumbarton. There, while the comparatively low hills

## SCOTLAND.

of Renfrewshire, with the thriving towns of Port-Glasgow and Greenock, are seen on the left, attention is called on the right to the towering alps of Argyleshire, sometimes ironically called the Duke of Argyle's Bowling-Green. The Argyleshire shores are here decorated with a long succession of villas, the favourite summer residences of the more affluent citizens of Glasgow. This mountainous region is penetrated by several inlets of the sea, one of which, named Loch Long, is 24 miles long. Another, named the Holy Loch, is shorter, but surrounded by equally picturesque ground. There is also an inland lake, Loch Eck, which presents some very beautiful scenery.

Separated from this rugged district by only a narrow strait is the island of *Bute*, displaying features only a little less highland, and remarkable for the amenity of its climate, on which account it is much resorted to by persons affected with pulmonary ailments. It measures 14 miles in length by about 4 in breadth, and contains some beautiful strips of level territory, in one of which is situated the mansion of the Marquis of Bute. The beautiful town of Rothesay, a favourite watering-place, occupies a fine situation on the north-east extremity of the island. Here are the ruins of a palace which formed the ordinary residence of the earliest sovereigns of the House of Stuart. The *Kyles of Bute*, as the strait above-mentioned is named, is remarkable for the fine vistas of alpine scenery which it opens up to the view of the tourist.

To the south of Bute lies the island of *Arran*, 22 miles long, and which entirely consists of a range of rocky mountains, the serrated outline of which, as seen from the neighbouring seas and shores, is extremely grand. The loftiest summit, Goat-fell (called by the natives *Goath-bhein*, the Hill of Storms), is 2800 feet high. Arran bears great value in the eyes of the geologist, on account of its presenting, within a narrow space, an epitome of the whole geological structure of Scotland. Its pathless glens and picturesque hills commend it equally to visitors who do not inquire into the mysteries of stratification and volcanic agency. The whole island, excepting a few small farms, belongs to the Duke of Hamilton, whose ancestor, James first Lord Hamilton, obtained it from the crown on his marrying Mary, the eldest daughter of James II., in the year 1474. There are now a number of large farms enclosed, subdivided, and well cultivated, having fine stocks of cattle and comfortable farm-steadings, where formerly there were numerous huts without chimneys or windows, and ridges running in all directions without a single enclosure or subdivision. At the north end of the island, under the lofty and isolated summit called the Cock of Arran, a small bay, denominated Loch Ranza, serves as a natural harbour, in which capacity it is turned to great advantage in the herring-fishery. On the shore of the bay there are a few scattered houses, an inn, an ancient castle in ruins, and a preaching station. A road sweeping round the east shore of the island leads to Brodick Bay, at the bottom of which there is a beautiful tract of low and sloping ground, ornamented with some fine wood, containing a hamlet, which forms a favourite resort for sea-bathing. On the adjacent height, amidst ancient woods, is the ancient chateau of Brodick, a mansion of the Duke of Hamilton. From this place a road strikes across the island, and opens up some magnificent scenery. Two or three miles to the southward of Brodick, the shore forms the more spacious recess of Lamlash Bay, at the bottom of which is a village of the same name, while it is landlocked in front by Holy Island, a small isle which formerly contained a monastery. Lamlash Bay is of great importance to the navigation of the Clyde and Irish Channel, as a harbour of safety.

*Loch Fyne*, a long narrow estuary, having the ridgy promontory of Kintyre on the one side and the district of Cowal on the other, opens up much fine scenery. In sailing up the loch, the first remarkable place is Tarbert, a fishing village situated at the bottom of a beautiful small bay, with a ruined fortalice of the Argyle

family perched on a rock by its side. Farther up the loch is Inverary, the beautifully-situated, village-like county town, chiefly forming a mere dependency of the neighbouring Inverary Castle, the principal seat of the ancient and illustrious House of Argyle. The rugged sylvan scenery around this mansion, with its views of seas, mountains, and distant islands, excites general admiration. Between Inverary and the inn of Tarbert on Loch Lomond, a road opens up a splendid tract of mountain scenery, the most striking being comprehended in the valley of Glencoe. Another road, proceeding in a northerly direction, leads to Loch Awe, an inland lake possessing many fine features, and upon which stands the ruined castle of Kilchurn, once the chief stronghold of the Breadalbane family. The loch is overhung by Ben Cruachan, a mountain 3390 feet in height, on the skirts of which King Robert Bruce gained a victory over his powerful enemy the Lord of Lorn.

The northern portion of Argyleshire, where it is bounded by the Western Ocean and its many inlets, contains much fine scenery. In a sheltered situation on the west coast stands the neat and cheerful town of Oban, a point of rendezvous for the numerous steamers permeating these seas, and a kind of entrepôt for the rural produce of the wide district around it. In front is the isle of Kerrera, where Alexander II. died in the course of an expedition to the Western Islands. On the coast, a little to the north of Oban, is Dunolly Castle, the mansion of the Macdougals of Lorn; and a little way farther north is Dunstaffnage, an ancient seat of the Caledonian kings, occupying a commanding site on the top of a rock overlooking the sea.

*Loch Linnhe*, opening between Lorn and Morven, and the commencement of the chain of salt and fresh-water lakes formed into the Caledonian Canal, presents on both sides scenery of a most romantic character—a mixture of bold rocky forelands, on many of which are perched the eyrie-like fortresses of the rude chiefs of the olden time, and green smiling hollows, within bays, where the elegant habitations of a modern gentry have been placed. The long island of Lismore, in the mouth of this estuary, was the ancient appanage of the bishops of Argyle, and temporarily the site of a college for Catholic priests, after the French seminaries were closed by the Revolution; but is now only remarkable for the great quantity of limestone exported from it. Opposite to its upper extremity, Loch Creran, a sub-estuary, branches off into the land of Lorn, opening up much beautiful scenery. On the south shore of Loch Linnhe, to the north of the opening of Loch Creran, is the district of Appin, previous to 1765 the property of a race of Stewarts, descended from a natural son of the last Lord Lorn, and for four centuries conspicuous in Highland history. In this district, the first mansion which occurs to the north of Loch Creran is Airds, the seat of Sir John Campbell. Next is the ruin of Castle Stalker, an ancient massive building. Appin House, the seat of Mr Downie of Appin, next occurs; and after that, at the mouth of Loch Leven, Ardahiel (Stewart, Esq.). From Ballahulish Ferry on Loch Leven, noted for its great quarry of slate, the west Highland road penetrates the savage vale of Glencoe.

*Glencoe* opens a little to the north of a solitary inn called the King's House, and extends about 10 miles in a north-westerly direction to Ballahulish. It may be described as a narrow strip of rugged territory, along which hurries the wild stream of Cona, celebrated by Ossian, who is said to have been born on its banks. On each side of the narrow banks of this river, a range of stupendous hills shoots perpendicularly up to the height of at least 2000 feet, casting a horrid gloom over the vale, and impressing the lonely traveller with feelings of awe and wonder. The military road sweeps along the right side of the glen. From the sides of the hills an immense number of torrents descend, sometimes sweeping over and spoiling the road, which is always, therefore, in a very precarious state. From the one end of the vale to the other only one human habitation is to be seen; and as it is not a road of much cur-

rency, the traveller may pass through it without meeting a single human being. The goats scrambling among the rocks, and the wild eagle hovering about the tops of the wall-like hills, are usually the only living objects within sight; and, as may be conceived, these rather increase than diminish the wildness and desolation of the scene. The place where the famous massacre of Glencoe happened is at the north-west end of the vale.

#### Inverness-shire—The Great Glen.

Between Loch Linnhe on the west coast, and a point on the Moray Firth near Inverness, there is a remarkable natural phenomenon, in the form of a glen or hollow, passing in a perfectly straight line for 60 miles through a mountainous region, and the bottom of which is nowhere more than 90 feet elevated above the level of the sea. It is called by the Highlanders *Glen-mòr-nan-Albin* (the Great Glen of Scotland). A chain of lakes extending along this extraordinary hollow suggested the formation of a canal which should admit of navigation between the seas on the two sides of the island, and save the dangerous passage round by the Pentland Firth; and this, under the name of the *Caledonian Canal*, was formed between 1803 and 1822, under the care of Mr Telford, at an expense of £800,000. (See Vol. I., p. 411.)

The canal commences at Clachnaharry, in the outskirts of the town of Inverness, and after six miles, enters the first of the chain of lakes, *Loch Ness*, a grand piece of water, 23 miles long, situated amidst stupendous and sterile mountains. The waters of Loch Ness never freeze, but they are often agitated simultaneously with the occurrence of earthquakes in distant parts of the world. On an elevated rock projected into the north-east margin of Loch Ness, are situated the remains of Urquhart Castle, consisting of a great square keep and several exterior walls of defence. It was besieged in 1303 by the officers of Edward I., and with great difficulty taken; it afterwards was a royal fortress; and finally, in 1509, it became the property of Grant of Grant, ancestor of the Earl of Seafield, to whom it now belongs. Glen Urquhart, which recedes behind Urquhart Castle, is a beautiful Highland vale, sometimes likened to Tempe, and containing many gentlemen's seats and a good inn. The conspicuous mountain, *Mealfourvonie* (Hill of the Cold Moor), upwards of 3000 feet in height, here begins to raise its huge bulk above the banks of the loch. About 500 feet from the summit there is a lake about a mile long, which cannot be much less than 3000 feet above the level of Loch Ness. On the top of the hill there is a cairn, the accumulation of which must have been a work of great labour. Mealfourvonie stands so prominently above the neighbouring hills, that it is not only singled out by the eye at Inverness, but is the first landmark seen on entering the Moray Firth, at the distance of a hundred miles.

The road along the south side of Loch Ness, though it presents numberless fine views, is enlivened by few traces of man's presence. The paucity of houses gives a sort of distinction to the inn named General's Hut, nearly 18 miles from Inverness, originally the residence of General Wade, while superintending the formation of his roads. Little more than a mile farther on, a recess or chasm in the hill by the side of the lake contains the celebrated *Fall of Foyers*. At the bottom of the recess there is a smooth little plain, descending upon the lake, ornamented by the house and shrubberies of Foyers, and where the steamers usually disembark such passengers as may desire to behold the waterfall. A path accessible to carriages, winds backwards and forwards, up the face of the hill, till the height of the public road is reached; and then there is a pathway leading down the face of the crags, towards a projecting rock, on which visitors usually stand to see the Fall. The Foyers is not a very copious stream, except in rainy weather; consequently there are great variations in the aspect of the cascade. In its medium fulness it pours through a narrow gullet in the rock,

in a round unbroken stream, which gradually whitens as it descends, till it falls into a half-seen profound, usually described as two hundred and forty feet below the point of descent, though this is supposed to be an exaggeration. A dense mist is constantly seen rising from the broken water, like the heavenward aspirations of an afflicted and tortured spirit. The noise is usually very loud. About a quarter of a mile farther up the ravine there is another cascade, usually called the Upper Fall—a fearful gulf, down which the water descends by three leaps, and over which a bridge has been thrown, by way of station for a sight of the cataract. The whole of this stupendous ravine is covered by birches, on whose every leaf a pearl of vapour dew is constantly hanging.

A few miles farther on, *Glenmorris* opens upon the north-west bank of Loch Ness. It is a valley full of romantic scenery, and belongs to a branch of the family of Grant. While the steam-borne traveller necessarily pursues the route by the lake, the traveller by the south road, after passing Foyers, leaves the brink of that piece of water, and advances into *Stratherrick*, a long valley behind the line of hills which overlook Loch Ness. A secluded valley called Killeen, opening upon this part of the road near Whitebridge, is spoken of as a singularly secluded and romantic piece of scenery. At the distance of thirty-two miles from Inverness, the road descends upon Fort-Augustus and the little village of Killcumming, so called as the burying-place of the Cummings, Lords of Badenoch.

*Fort-Augustus*, situated in a pleasant opening amongst the hills, at the termination of Loch Ness, was erected in 1780 as an addition to the means previously existing for the control of the turbulent children of the mountains. Its purposes being long since accomplished, it has for many years been only occupied by two or three artillerymen. From Fort-Augustus, the cut of the canal is resumed, and several locks are ascended; a very few miles brings it to *Loch Oich*, the smallest of the chain of lakes. The scenery is here finer than at any other part of the Great Glen. On the north-west bank of the loch is Invergarry, till a recent period the residence of the chief of Glengarry, a handsome modern building, in the immediate neighbourhood of an older mansion, which has been in ruins since burnt down by the king's troops in 1746, in consequence of the part taken by the chief in the rebellion.

The next and last loch is *Loch Lochy*, the hills environing which are the most hopelessly wild and stupendous of all in the glen. The summit-level of the canal is between Loch Oich and Loch Lochy, being 90 feet above the ordinary high-water mark at Fort-William, and 94 above that at Inverness—a difference to be accounted for by the pressure of the Atlantic on the west shores of Scotland. The lonely little inn of Letter Findlay is the only house at first seen on Loch Lochy; but when the west end is nearly reached, the traveller discovers, in a recess on the right side, the House of Auchnacarrie, which was the residence of the gallant and unfortunate Lochell before he entered upon the fatal campaign of 1745. The canal, after leaving this loch, descends in a precipitous series of locks, called *Neptune's Staircase*, into Loch Eil, a continuation of Loch Linnhe, the arm of the sea formerly mentioned.

At this point the glen is more spacious than anywhere else. It is, however, the spaciousness of a moor. The River Lochy, which issues from the lake of the same name, pours its voluminous and impetuous flood towards Loch Eil on the left; and beyond it Ben Nevis is seen to rear his enormous head, with the vale of Glen Nevis withdrawing from his mighty side into the solitudes of Lochaber. At the distance of little more than a mile is the town of Fort-William, so called from a fortress of the same name built for the repression of Highland turbulence, and now nearly disused.

A cluster of glens to the south of the Great Glen, is remarkable for a natural phenomenon, usually called the Parallel Roads of *Glenroy*, such being the name of

## SCOTLAND.

the vale in which the wonder is most conspicuously marked. It consists of a set of terraces, in most places three in number, extending along both sides of these vales for many miles, the uppermost 82 feet above the second, which, again, is 212 feet above the first. The common people represent these terraces as roads formed at the command of Fingal, an early hero, for his convenience in hunting; but they are in reality ancient beaches of inland seas—phenomena with which modern geologists are familiar.

### Western Islands.

The Western Islands are generally bleak and rugged in surface, and occupied by a very poor class of tenantry. In some of them, particularly Skye and Bigg, the scenery attains to a savage grandeur. It is not possible here to present a particular description of any besides the Isle of Staffa, so remarkable for its basaltic structure. It is about  $1\frac{1}{2}$  miles in circumference, and bears no human habitation, its only useful tenants being a small herd of black cattle. At the point of greatest elevation towards the south-west, this island is 144 feet high. On the north-east it presents a face of somewhat less height, composed of basaltic columns, and penetrated by several caves of various sizes, into which the sea occasionally breaks with the report of thunder. This face, according to Dr Macculloch, is formed of three distinct beds of rock, of unequal thickness, inclined towards the east in an angle of about 9 degrees: the lowest is a rude trap tufa; the middle one is divided into columns placed vertically to the planes of the lowest bed; and the uppermost is an irregular mixture of small columns and shapeless rock—the whole being partially covered by a fine verdure. The central columnar part having in some places given way, is the occasion of the numerous caves by which the island seems perforated.

At the north-east point of the island, the dipping of the rocks is so low as to afford a safe landing-place at any time of the tide. Proceeding thence, the visitor is conducted along the north-east face, and is introduced to the *Clam-shell* (Scallop) *Cave*, where a curious confusion in the columnar structure is observable. The columns on one side are bent, so as to form a series of ribs, not unlike the inside view of the timbers of a ship; while the opposite wall is formed by the ends of columns, bearing a general resemblance to the surface of a honeycomb. This cave is 30 feet in height, and 16 or 18 in breadth at the entrance; its length being 130 feet, and the breadth contracting to the termination. Next occurs the noted rock, *Buachaille* (the Herdsman), a conoidal pile of columns, about 80 feet high, lying on a bed of curved horizontal ones, visible only at low water. There is here an extensive surface, resembling that of the Giants' Causeway, and composed of the broken ends of pillars once continuous to the top of the cliff. The colonnade is now for some distance upright and very grand, till the visitor reaches the *Uaimh Binn* (Musical Cave), usually called *Fingal's Cave*, by far the most impressive and interesting object in the island. It opens from the sea with a breadth of 42 feet, a height of 66 feet above the water at mean tide, the pillar on one side being 36 feet high, and that on the other 18. The depth of the recess is 227 feet, and the breadth at the inner termination 22. The sides within are columnar throughout; the columns being broken and grouped in many different ways, so as to catch a variety of direct and reflected tints, mixed with secondary shadows and deep invisible recesses. As the sea never ebbs entirely out, the only floor of this beautiful cave is the fine green water, reflecting from its white bottom tints which vary and harmonise with the darker tones of the rock, and often throwing on the columns flickering lights, which its undulations catch from the rays of the sun without.

### ANTIQUITIES, &c.

There are in Scotland, and particularly in the district between the Firth of Tay and Moray Firth, nume-

rous mounds, upright slab stones, and carved stones, which are supposed to have been raised as monuments over slain warriors, by the early inhabitants of the country, or by the Danes or other northern nations who occasionally invaded it in remote times. The most remarkable examples of mounds are two at Dunipace on the Carron in Stirlingshire, and one at Fettercairn in Kincardineshire. A distinct class of mounds, called *moot* or *moot hills*, are common in the south-western and several other districts. They are generally of a square form, with a flat top. It is believed that they served as places for the administration of justice in rude ages. Such is the opinion of the antiquary, who regards these mounds as *artificial*, and raised for a specific purpose; but to the geologist acquainted with the phenomena of raised beaches, moraines, and denudations, they appear, what in most instances they really are, substantial *natural* accumulations, which may have been employed by our early ancestors as above described, but which assuredly were never erected by them. For a geological account of the mounds of Dunipace the reader is referred to an article in 'Chambers's Journal,' No. 144, New Series.

Of the carved stones, a remarkable example exists at Forres. It contains figures of men and animals in various compartments. There is another very entire and curious specimen at Aberlemno in Forfarshire. A third at Meigle is remarkable as containing a representation of one of the war-chariots used by the original inhabitants of the country.

In the north of Scotland, and in Orkney, there are some surviving examples of a very remarkable class of early buildings, to which the common people now give the name of *Picts' Houses*, as supposing them to have been built by the Picts. They are generally round buildings, of no great height, with round vaulted tops, altogether built of courses of dressed stone without mortar, and containing for the most part one central chamber, and several long narrow recesses in the thickness of the wall. Circular mounds, the remains of British and Danish camps, are common on the tops of the Scottish hills, having probably been the places to which the early people retired with their flocks in times of danger. On several hills, particularly in Perthshire and Inverness-shire, there are remains of walls, presenting appearances as if the stony materials had been artificially vitrified. It is not yet ascertained whether these *vitrified forts*, as they are called, were works of our Caledonian ancestors, or the effect of accident, though the former is the more likely supposition.

The weapons used by the aboriginal people are often found, consisting of stone axes, arrow-heads of flint, &c. Necklaces, bracelets, and other ornaments used by them, barbarous in style, but generally of gold, are also often found. In various districts Druidical circles still exist in a tolerably entire state; but none on so large or regular a scale as those of Stonehenge and Abury. There are remains of roads and camps formed by the Romans in their hesitating and imperfect attempts to subdue North Britain; and of the wall built under the Emperor Antoninus, between the Firths of Forth and Clyde, with forts at regular intervals, it is still possible to discern a few traces.

The next class of antique objects are the remains of the Gothic fanes, reared on account of religion during the period when the Romish church was triumphant. These are everywhere very numerous, but in few cases tolerably entire. Excepting two cathedrals, those of Glasgow and Kirkwall (in Orkney), all of that class of structures are in ruins. The abbies, priories, and other conventual and collegiate establishments, are in every instance gone to decay. Melrose Abbey, the Cathedral of Elgin, and the Collegiate Church of Roslin, are the most beautiful of these ruinous buildings.

Numerous specimens of the towers and castles occupied by men of note in the middle ages still exist, though mostly in a decayed state. Those which indicate the greatest strength and consequence are—*Lochmaben Castle*, the residence of the Bruces, Lords of An-

nandale; *Hermitage* (Roxburghshire), which belonged to a powerful noble named Lord Souhis; *Douglas*, the residence of the Earls of Douglas; *Turnberry* (Ayrshire), the residence of the Earls of Carrick; *Bothwell*, another stronghold of the Douglases; *Tantallon* (Haddingtonshire), the residence of the Earls of Angus, a branch of the Douglas family; *Dunnottar* (Kincardineshire), the seat of the Earls Marischal; and *Doune* (Perthshire), the stronghold of Robert Earl of Fife, brother of Robert III., and governor of Scotland. Four places of strength, *Edinburgh*, *Stirling*, *Dumbarton*, and *Blackness Castles*, are still kept in repair at the public expense, and serve as barracks for soldiers.

The mansions of the nobility and gentry of Scotland do not differ in any important respect from similar classes of structures in England. The 'hall' is, however, completely wanting in Scotland, and there are comparatively few specimens of the Elizabethan style. Turbulent times being more recent in Scottish than in English history, the chief mansions of an unfortified character in the northern kingdom are not of earlier date than the reign of Charles II., and most of them are much later. In many instances, the whole or part of the original castellated buildings which stood on the same site have been retained.

In the reign of Charles II., mansions were for the first time built in anything like pure Grecian taste. This was introduced by Sir William Bruce of Kinross, Bart., an architect of considerable skill, and of whose works the modern Holyrood Palace, and his own house of Kinross, are examples. During the last century, the mansions built in Scotland have partaken of all the changes of taste passing through England, from the heavy barrack-like structures of Sir John Vanburgh, to the light and elegant Grecian style of Adam. We have now châteaux in the style of the middle ages; Grecian structures by Adam; mansions in the Doric and more sombre Grecian style since introduced; and very lately, a few specimens in the priory and Elizabethan styles. (See ARCHITECTURE, Vol. I.)

#### CHIEF CITIES, TOWNS, PORTS, &c.

*Edinburgh*, the capital, is situated in the county of the same name, on a cluster of eminences, distant between  $1\frac{1}{2}$  and 3 miles from the Firth of Forth. The city is composed of two principal parts, the Old and New Towns; the former being built on a long narrow eminence gently rising towards the west, where it terminates in a lofty and abrupt rock, on which the castle is situated; while the latter occupies lower ground towards the north. The town is universally built of a fair sandstone, which retains its original colour in the newer parts of the town and in the best public buildings, and forms one of the most important features of Edinburgh. The New Town is laid out on a regular plan of rectangular streets and squares, exhibiting in general much architectural elegance. Between the Old and New Towns, and between various sections of the New Town itself, as well as in the centres of the principal squares, there are gardens laid out in the modern landscape style, forming delightful places of recreation. It is chiefly owing to the unequal ground on which Edinburgh is situated, the massive elegance and regularity of its buildings, the intermixture of ornamental pleasure-ground, and the picturesque hills immediately adjacent, whence distant and extensive prospects are commanded, that this city makes so great an impression on most strangers.

Formerly the seat of the government of the country, Edinburgh is still that of the supreme law-courts and of a flourishing university. It is also to a great extent a city of residence, not only for affluent persons connected with the country, but for strangers desirous of enjoying a society of moderate habits, and the benefits of education for their children. Its leading classes are thus composed of legal practitioners, learned persons, and families in independent circumstances. It is only in a small degree a manufacturing town, the principal trades being the brewing of ale (for which the town is

celebrated), coachmaking, the weaving of shawls, and the printing and issuing of literary productions. The leading periodical publications are the Edinburgh and North British Reviews, Blackwood and Tait's Magazines, a Philosophical and Medical Journal, one or two Ecclesiastical Magazines, besides several weekly sheets of extensive circulation. The town is distinguished for its numerous banking institutions, which exert an influence on the general trade of the country. Within a few miles of the city, on the Esk River, there are various paper-mills, at which vast quantities of paper are made, both for the home trade and for exportation to London. The city is now the centre of the Scottish railway traffic, having lines and telegraphs communicating with Perth, Dundee, and Aberdeen, on the north; with Glasgow on the west; with the west of England via Carlisle; and with the east of England via Berwick and Newcastle. The transit to London can be made in twelve hours, and communications by telegraph in less than an hour.

Amongst the remarkable objects in the city, the most striking is the Castle, a large fortress romantically situated on the summit of a mass of igneous rock, between 200 and 300 feet in sheer height. It contains, besides various batteries and other fortifications, an ancient palace, in which Queen Mary was delivered of her son James I. of Great Britain, and a modern barrack, in which a foot regiment is usually quartered. In a well-protected room are shown the crown, sceptre, mace, and sword, which formed the regalia of the Scottish line of princes. The Courts of Law are situated in the centre of the Old Town, and are composed of a great hall, formerly the meeting-place of the Scottish Parliament, rooms for the two various divisions of the civil court and for the lords ordinary, a room for the High Court of Justiciary (supreme criminal court), and other accommodations. The extensive libraries belonging respectively to the Advocates (barristers) and Writers to the Signet (solicitors) are adjacent; the former being a collection of upwards of 150,000 volumes. Holyroodhouse, the palace of the Scottish kings, is situated at the lower extremity of the principal street of the Old Town. The oldest part is a mass of building erected by James V., containing the presence-chamber, bedroom, and other apartments, used by Queen Mary, with some of the original furniture; as also a gallery, furnished with (generally imaginary) portraits of the kings of Scotland. The apartments of the queen are to be regarded with no ordinary interest, both as furnishing a curious and faithful memorial of the domestic accommodations of a princess of the sixteenth century, and on account of that extraordinary incident, the murder of David Rizzio, which took place within them. Another part of the building, erected in the reign of Charles II., contains the apartments used by George IV. for his levée in 1822, and a suite of rooms which furnished accommodation to Charles X. of France and his family, during the years 1831-2-3. Closely adjoining to the palace are the ruins of a Gothic church, originally that of the Abbey of Holyrood, and latterly a chapel-royal.

The College is a large modern quadrangular building, in the southern quarter of the city. It contains class-rooms for the professors (33 in number), a library of splendid proportions and decoration, and an extensive museum of natural history. The university is chiefly distinguished as a school of medicine; but it is also the means of preparing a great number of the native youth for the professions of law and divinity. The Register-House is a beautiful building, planned by Adam, in a conspicuous part of the New Town; it contains the records connected with the legal business of the country. The Royal Institution is the general appellation of an elegant building facing the centre of Princes Street, and containing halls for various public bodies, as the Royal Society of Edinburgh, the Antiquarian Society of Scotland, the Scottish Academy of Painting and Sculpture, and an academy for instruction in drawing. Of places of worship, the most re-

## SCOTLAND.

markable are St Giles's Church in the Old Town (once the cathedral), a Gothic building of the fifteenth century, lately renovated; St George's, St Stephen's, and St Andrew's, modern churches of the establishment; and St Paul's and St John's, elegant Gothic chapels of the Episcopalian body. There are two Roman Catholic chapels, and many dissenting places of worship. Of the other public buildings, the most remarkable are the Infirmary; the hospitals for the maintenance and education of poor children, of which Heriot's and Donaldson's are the most elegant; the Surgeons' and Physicians' Halls; and the offices of the Bank of Scotland, of the Royal, Commercial, and other banks. On the Calton Hill are situated some other public structures, as the County Jail and Bridewell; monuments to Nelson, Dugald Stewart, Burns, and Professor Playfair; an astronomical observatory, and a small portion of a building designed as a national monument to the Scotsmen who perished in the last war, but which will probably never be completed. In Princes Street Gardens stands the monument erected in honour of Sir Walter Scott—a superb structure of Gothic design, and undoubtedly one of the leading ornaments of the city. The population of Edinburgh and Leith in 1821 was 138,235; in 1831, 162,403; and in 1841, 166,450.

*Leith*, the seaport of Edinburgh, but an independent parliamentary burgh, is situated at the efflux of the rivulet of the same name, which originally constituted its harbour. The older part of the town is crowded and mean, but in the outskirts there are some good streets. The town is connected with Edinburgh by a broad and beautiful road, above a mile in length, denominated Leith Walk. Besides the quays skirting the embouchure of the river, there is a range of wet-docks, and extensive operations are now in progress for the improvement of the harbour, which labours under several heavy natural disqualifications. During spring-tides, the utmost depth of water on the bar at the mouth of the river is 17 feet—during neap-tides, 14 feet; and it is rarely that a vessel of 400 tons can gain admission. The want of deep water at Leith is partly supplied by a small harbour at Newhaven, an extensive and substantial stone-pier at Granton, and a chain-pier at Trinity, which serve as places of embarkation and debarkation for steamers and other vessels devoted chiefly to passengers. The chief foreign trade of Leith is with the ports in the Baltic and north of Europe; next to this in importance ranks its intercourse with the West Indies. But the imports of Leith are chiefly for local consumption, and bear little reference to the great manufacturing business of the country. For the coasting trade there are various companies, each of which has several vessels in employment. Amongst the ports with which regular intercourse is carried on by steam, may be mentioned London, Hull, Newcastle, Dundee, Aberdeen, Hamburg, and Rotterdam. The tonnage belonging to Leith is somewhat stationary: it was, in 1826, 25,674; in 1832, 23,094; in 1835, 22,073; and in 1845, 22,258—of which 2,750 belonged to vessels under 50 tons burthen, and 19,508 to vessels upwards of 50 tons. In the same year the number of sailing vessels under 50 tons was 100; above 50 tons, 118. Besides the above there were 8 steamers under 50 tons, having an aggregate tonnage of 199; and 9 steamers above 50 tons, having an aggregate tonnage of 1,972. In 1844 the nett receipt of customs' duties was £500,924; in 1845 it was £606,407. In Leith there are several breweries, a sugar-refining establishment, and several manufactories of soap, candles, ropes, and glass. The Custom-house, an elegant modern building, is the seat of the Board of Customs for Scotland. In 1831 the population of Leith was 25,855; in 1841, 33,473. The town, in union with Newhaven, Portobello, and Musselburgh, returns a member to parliament.

*Glasgow*, the most populous city in Scotland, occupies a highly advantageous situation on the banks of the Clyde, in Lanarkshire, a few miles from the place where the river expands into an estuary, 42 miles from Edin-

burgh, 397 from London, and 196 from Dublin. The external appearance of this great city is elegant and impressive. The streets are regular in arrangement, and substantially built of smooth stone. The public buildings are in general handsome, and in most instances disposed in such a manner as to be seen to advantage. The more ancient part of the city extends along the line of the High Street, between the Cathedral and the river; the more modern and elegant part stretches towards the north-west. On the left bank of the river, and connected by three bridges, is situated the populous barony of Gorbals, bearing the same reference to Glasgow which Southwark bears to London. Westward from the lowest of the bridges, both sides of the river are formed into quays, which, owing to recent operations for deepening the channel, are now approached by vessels drawing about fourteen or fifteen feet water. The quay on the north bank is denominated the *Broomielaw*: it was recently extended to 3340 feet in length, while that on the south bank is 1260 feet; and is still, along with the entire navigation of the river, undergoing important improvements.

Glasgow took its rise as a dependency of the cathedral of the bishops (latterly archbishops) of the see bearing its name. It was not, however, till long after the Reformation that it became a seat of considerable population. About the middle of the eighteenth century, it had acquired a considerable share of the import colonial trade, which it still retains; but during the last seventy years, it has chiefly been distinguished as a seat of manufactures. The weaving of lawns, cambrics, and similar articles, commenced in Glasgow in 1725. The advantages enjoyed by the city for the importation of cotton, in time gave a greater impulse to that species of manufacture. In 1834, out of 134 cotton-factories existing in Scotland, 100 belonged to Glasgow and its neighbourhood; and the importation of cotton into that port amounted to 95,703 bales. In the weaving of this material, upwards of 15,000 power-looms, and 32,000 handloom weavers, were at the same time employed by the manufacturers of Glasgow. In 1845 there were in Glasgow and neighbourhood, 784,756 spindles, and 7847 workers; 17,620 power-looms, and 11,200 workers. The value of the spinning-factories was estimated at £784,756; of the power-loom or weaving factories, at £264,300. The calico-printing establishments, connected with the chief manufacture, are between 40 and 50 in number. It would be vain to attempt an exact enumeration of the less prominent features of the business carried on in Glasgow. The chief articles of importation besides cotton are sugar, rum, tea, tobacco, and timber. The chief articles manufactured or prepared besides cotton goods are sugar, soap, glass, iron, ropes, leather, chemical stuffs, and machinery. There were recently seven native banks, and several branches of other banks. During a year, extending from a certain period in 1839 to a certain period in 1840, 5484 vessels, of 296,302 tonnage, arrived at the Glasgow harbour; the customhouse revenue of 1839 was £468,975, and the harbour dues of the twelvemonth ending August 31 of that year were £45,826. In 1845, 438 vessels belonged to Glasgow, with an aggregate burthen of 117,000 tons; and in the same year the gross receipts at the customhouse were £551,851. It is worthy of remark, that the Clyde was the first river in the elder hemisphere on which steam navigation was exemplified. A steam-vessel of three-horse power was set afloat on the river in January 1812, by Mr Henry Bell of Helensburgh; and there were twenty such vessels on the Clyde before one had disturbed the waters of the Thames. In 1845 there were sixty-seven steam-vessels, of 11,100 aggregate tonnage, connected with Glasgow, eighteen of which plied to Liverpool, Belfast, Dublin, and Londonderry. Within the last few years the city has become a great centre of the iron trade, this metal being produced in the neighbourhood to an annual amount of not less than 200,000 tons. As a necessary consequence of the commerce and manufactures which flourish in Glasgow,

the city has a vast retail trade in all the articles of luxury and necessity which are used by human beings. But no circumstance connected with Glasgow could give so impressive an idea of the height to which business has been carried in it, as the rapid advance and present great amount of its population. By the census of 1791, the inhabitants were 66,578; and by the first government census in 1801, they were 77,885. But these numbers have been increased in 1811 to 110,749; in 1821 to 147,043; in 1831 to 202,426; and in 1841 to 274,533—a mass of population which, at the time of the Union, could not have been dreamt of as likely ever to exist in any Scottish city.

The Cathedral, or High Church, is situated in the northern outskirts of the city, near the upper extremity of the High Street. The bulk of the existing building was constructed at the close of the twelfth century, in place of another which had been consecrated in 1156, but was destroyed by fire. It consists of a long nave and choir, a chapter-house projecting from the north-east angle, a tower and spire in the centre, and a crypt extending beneath the choir or eastern portion of the building. In the nave, termed the Outer High Kirk, was held the celebrated General Assembly of the Church, November 1638, by which Episcopacy was abolished and pure Presbytery replaced—the first great movement in the civil war.

The elevated ground near the east end of the Cathedral has been formed into an ornamental place of sepulture, under the appellation of the Necropolis. Since 1831, the Society of Merchants, its proprietors, have expended the sum of £6000 in laying out about twenty-four acres of ground in walks and shrubberies, and in connecting the spot with the opposite slope by means of a bridge across the intermediate rivulet. The taste manifested in the whole scheme and in its execution is extremely creditable to the city. The walks, several miles in extent, command an extensive view of the neighbouring country. They are skirted by numberless sepulchral plots and excavations, where already affection has been busy in erecting its 'frail memorials,' all of which, it may be mentioned, are fashioned according to certain regulations, with a view to general keeping and effect.

The College buildings are situated on the east side of the High Street, about half-way between the Cathedral and the Tron-gate. They consist in a sort of double court; the front which adjoins to the street being 330 feet in length, and three storeys in height. The whole edifice has a dignified and venerable appearance. A large piece of ground behind the College is formed into a park or green, interspersed with trees and hedges, and always kept in grass, to be used by the students as a place of exercise or amusement. In the College there are appointed professors or teachers of about thirty branches of science, theology, and polite literature. At the back of the interior court stands the modern Grecian building which contains the Hunterian Museum. This is a large collection of singular natural objects, coins, medals, rare manuscripts, paintings, and relics of antiquity, originally formed by Dr William Hunter, the celebrated anatomist, and bequeathed by him to this university, at which he received his education. While the College confers professional education, popular instruction is attainable, under unusually advantageous circumstances, through the medium of the Andersonian Institution, an extensive school of science founded at the close of the last century, and connected with which there is a general museum, containing many curious objects, and constantly open to the public.

The most attractive modern building in Glasgow is the Royal Exchange in Queen Street, a most superb structure, erected in 1829, as a point of assemblage for the merchants in the western part of the city. The principal room is a large hall, supported by a double row of columns, and used as a reading-room. The front of the Exchange consists of a magnificent portico, surmounted by a cupola; and as the building

is isolated, the other sides are also of decorative architecture. Altogether this building, supported by a set of very elegant domestic structures of similarly august proportions, impresses the mind of a stranger as something signally worthy of a great city.

Since the Reform Act of 1832, Glasgow has the privilege of returning two members to parliament. The places of worship, charitable and educational institutions, and associations of various kinds for public objects, are very numerous. A laudable zeal for the improvement of education marks the city; and a normal school, or seminary for the rearing of teachers—the first in the empire—has been erected under the auspices of a private society.

The means of communication in connection with Glasgow, are suitable to the character of the city as one of the greatest emporia of commerce and manufacture in the world. Besides a river, navigable by vessels drawing fifteen feet of water, and which gives the means of a ready communication with the western shores of Britain, with Ireland, and with America, the Forth and Clyde Canal, of which a branch comes to Port-Dundas, in the northern suburbs, serves to convey goods and passengers to the eastern shores of the island, while canals of less note connect the city with Paisley and Johnstone in one direction, and with the great coal-fields of Monkland in the other. There is also railway communication connecting it with Edinburgh and the north of Scotland on the one hand, and with the south of Scotland and England on the other. The steam communication between Glasgow and Liverpool, Dublin and other Irish ports, is conducted on a scale which may be called grand. The vessels are superb in magnitude, decoration, and power; and they sail frequently and rapidly. The steam intercourse between Glasgow and various places in Scotland, both for passengers and objects of traffic, is also conducted on a great scale: among the places touched at in the Clyde and to the south are Greenock, Dumbarton, Dunoon, Rothesay, Arran, Gourock, Troon, and Ayr. Among the places to the north to which vessels sail regularly are Inverary, Campbeltown, Oban, Staffa and Iona, Mull, Arisaig, Skye, Stornoway, and Inverness. In opening up markets for West Highland produce, and introducing luxuries in return, these vessels have also been of marked service, inasmuch that the value of property in those hitherto secluded districts has experienced a very considerable rise.

The country around Glasgow, particularly towards the south, abounds in busy towns and villages, of the former of which the most remarkable is *Paisley*, situated in Renfrewshire, on the banks of the small river Cart, 7 miles from the city above described. The external appearance of this town is pleasing, and the streets are in general composed of substantial buildings. It originated from an abbey founded in 1160 by Walter, the first of the Stewarts, and of which considerable remains still exist. Paisley is a noted seat of the manufacture of shawls, and also of cotton thread, gauzes, and velvets. In the town and Abbey parish, exclusive of the large village of Johnstone, there were lately three cotton spinning-mills, and seven or eight thread-mills; two steam-loom factories; six flour-mills; a calico-printing work; many bleaching-works and dye-houses; three breweries and two distilleries; several timber yards; and several iron and brass foundries; an alum and copras work, a soap work, and a tan-yard. An idea of the present extent of manufactures, in comparison with what it was in the last age, may be obtained from the fact, that while the whole of the manufactures in 1760 amounted to £15,000, the annual computed value of the goods made in and around the town a few years ago was £2,000,000.

Paisley has been changed by the Reform Acts from a burgh of barony into a parliamentary burgh of the first class, returning one member, divided into wards for municipal purposes, and managed by sixteen councillors, including a provost, four bailies, and a treasurer. Being, though not the county town, the seat of the

## SCOTLAND.

sheriff court, it is adorned by a large modern castellated building, containing a jail, bridewell, and series of court-rooms; but unfortunately the edifice is placed in a low situation, without reference to salubrity or external influences. Devoted as the inhabitants of Paisley are to the pursuits of business, they have long been honourably remarkable for a spirit of inquiry and a desire for intellectual improvement. The population of Paisley, like that of Glasgow, has experienced a very rapid advance: the inhabitants of the town and surrounding parochial district, in 1821, amounted to 47,003; in 1831 to 57,466; and in 1841 to 60,487.

Notwithstanding the inland situation of Paisley, its means of communication are unusually facile and ample. The White Cart, navigable from its efflux into the Clyde to the Sneddon in the outskirts of Paisley, presents all the advantages of a canal. A canal leaves the southern suburbs of Glasgow, and passing Paisley, terminates at Johnstone. Paisley is also benefited by the Glasgow and Ayr Railway, which passes it, as well as by the other lines which centre in Glasgow.

In Renfrewshire also is situated *Greenock*, till recently the greatest seaport of the kingdom as far as customhouse receipts form a criterion, these having been, in 1834, £482,138 in gross amount. Of late, the port of Greenock has been on the decline, in consequence of the improvement of the river to Glasgow: in 1845 the gross customhouse receipts were less than £348,000; while Glasgow was £498,000; and Leith, £628,000. This town occupies a strip of sloping ground facing towards the Firth of Clyde, at the distance of 24 miles from Glasgow. In the seventeenth century it was a mere hamlet; now it is a handsome town of about 40,000 inhabitants; its population in 1841 being 36,936; containing harbours and quays of 2200 feet in extent, to which belonged, in the same year, 422 vessels, of 82,200 tonnage. It is now, moreover, by virtue of the recent Reform Acts, a parliamentary burgh of the first class, returning one member to parliament. The principal branches of commerce conducted in Greenock have reference to the East and West Indies, the United States, and British America, to which last it yearly sends out great numbers of emigrants. Sugar-baking and ship-building are other branches of industry carried on here to a great extent. The Customhouse, fronting to the Firth of Clyde, is a beautiful Grecian building, erected in 1818 at an expense of £30,000. The Tontine Hotel—situated in one of the principal streets, and containing a large public room, 12 sitting-rooms, and 30 bedrooms—was built in 1801 by 400 subscribers of £25 each, the whole expense being thus £10,000. There is also an elegant building, in the character of an Exchange, which cost £7000, and contains, besides two spacious assembly rooms, a reading-room, to which strangers are admitted gratuitously for six weeks. In Greenock there are two native banks, besides branches of several others.

James Watt, the improver of the steam-engine, was born in Greenock in 1736; and an institution for literary and scientific purposes, designed to serve as a monument to him, and termed the Watt Institution, was completed several years ago. The situation of the town, on the shore of a land-locked basin of the Firth of Clyde, with the mountains of Argyshire and Dumbartonshire rising on the opposite side, is very fine.

Amongst Scottish towns, *Aberdeen* ranks next to Edinburgh and Glasgow. It is situated in the county named from it, on a level piece of ground between the effluxes of the rivers Dee and Don, 110 miles from Edinburgh. Its external appearance produces a favourable impression; the principal streets are straight and regular, and the buildings at once substantial and elegant, the chief material used in constructing them being a gray granite found here in great abundance. New Aberdeen, or what is now generally called Aberdeen, is close to the efflux of the Dee, the mouth of which forms its harbour; and Old Aberdeen, where the ancient Cathedral and King's College are situated, is a comparatively small town, about a mile distant, on the

bank of the Don. The aggregate population, according to census 1841, was 64,767.

Aberdeen is a city of great antiquity. It became the seat of a university by the erection of King's College in Old Aberdeen in 1495; Mareschal College, in New Aberdeen, was added in 1593. By the recent Reform Acts it is a royal burgh of the first class, divided into districts for municipal purposes, and returning one member to parliament. Aberdeen is at once a seat of manufactures and a seaport. There are several houses engaged in the cotton manufacture, a few in the woollen trade, and three or four in flax-spinning and the weaving of linen. Ship-building, iron-founding, comb-making, rope-making, and paper-making are also carried on to a great extent. The fisheries of the River Dee, and the export of granite, are sources of considerable income. Of the exports for the year 1836, we may notice, as indicating at once the extent and nature of the agricultural and manufacturing products of the district, the following items:—Flax manufactures, 30,482 barrel bulk; cotton manufactures, 16,336 do.; woollen manufactures, 20,043 do.; oats, 69,239 quarters; meal, 13,375 bolls; sheep and lambs, 1407; pigs, 3034; butter, 9261 cwts.; eggs, 8120 barrel bulk; pork, 6006 cwts.; salmon, 7757 do.; granite stones, 1738 tons. The chief imports are—coal, of which there was unloaded, during the same year, 371,914 bolls; lime, cotton, flax, wool, wood, wheat, flour, salt, iron, whale-blubber, and miscellaneous goods, consisting of groceries, &c. There were in 1836 belonging to the port of Aberdeen 360 vessels, tonnage 42,080, employing 3110 men; in 1845 there were 322 sailing vessels, with a tonnage of 48,559; and 14 steamers, with a tonnage of 3951. The gross receipts of the customhouse in 1845 was £76,259.

Aberdeen is entered from the south by Union Street, an elegant double line of buildings, 1 mile in length and 70 feet wide, in the centre of which a ravine, pervaded by a rivulet, is crossed by a noble arch of 132 feet in span, upon a rise of 22. King Street, which opens up the city from the north, is 60 feet wide, and contains many splendid edifices. Besides these two main streets, there is a considerable number of modern squares and terraces. The public buildings are much scattered, but are generally of an elegant appearance. The Public Rooms, erected by the gentlemen of the counties of Banff, Aberdeen, Kincardine, and Forfar, for meetings, dancing assemblies, &c., and partly occupied as a reading-room, constitute a handsome Grecian structure, fronting to Union Street. On the north side of Castle Street stands the Town-House, and in the centre is the Cross, a curious structure re-erected in 1822, and containing sculptures of eight Scottish sovereigns between James I. and James VII. Mareschal College, formerly a plain old structure, has lately been re-edified in handsome style, chiefly at the expense of the nation. King's College consists of a handsome but ill-assorted quadrangle, surmounted by a fine tower and spire. The two colleges are attended by about 500 students, nearly equally divided between them. In Old Aberdeen are also to be seen the remains of the Cathedral, consisting of the nave of the original building, with two towers at the west end. The ceiling is composed of oak, cut out into forty-eight compartments, each displaying in strong colours the armorial bearings of some eminent person, whose name is given below in Latin, and in the old Gothic character.

*Dundee*, situated in Forfarshire, on the shore of the Firth of Tay, may be considered as the fourth town in Scotland, whether in population or in the importance conferred by wealth. It is a busy seaport, and the chief seat of the linen manufacture in Scotland, and indeed in Great Britain. A series of docks, the erection of which cost about £400,000, extend along the shore, where, a century ago, there was only a small quay in the form of a crooked wall. In 1845 Dundee had 44 vessels under 50 tons, giving 1599 tonnage; 265 above 50 tons, giving 46,376 tonnage; and 8 steamers of 1560 tonnage. The gross receipts at the custom-

house amounted in the same year to £42,737. In 1815 the harbour dues amounted to £4,411 only; but in 1846 they exceeded £25,000. 'In 1745,' says Mr McCulloch, 'only 74 tons of flax were imported. From that period to 1791 the progress of the manufacture was more rapid: in the latter year 2444 tons of flax and 299 tons of hemp being imported, and about 8,000,000 yards of linen, sail-cloth, &c. exported. Previously to this period all the yarn used in the manufacture was spun upon the common hand-wheel, partly in the town, and partly in the adjacent country; but the spinning of yarn by machinery began soon after to be introduced, and the increased facility of production, consequent to the erection of flax-mills, has been such, that the cost of the yarn, including of course the raw material, is now less than the mere expense of spinning amounted to 40 years ago! In 1811, 4 spinning-mills had been constructed in Dundee: in 1831 the number was increased to 31; and in 1846 there were 50! The imports of flax in 1845 amounted to 19,865 tons; flax codilla, 9198 tons; hemp, 1200; jute, 9298. The exports in the same year were 77,000 pieces Osnaburgs; 282,000 pieces sheetings; 952 cotton bagging; 28,000 sundries; 160,000 sail-cloth; 133,000 sacking; 73 dowlas; and 30 sundries. The entire annual value of the linen goods manufactured in Dundee are estimated at £1,600,000! Besides the factories connected with the linen trade, there are several extensive machine-factories, candle-factories, sugar-refineries, and establishments for rope-making and ship-building. This great hive of industry contained in 1831 a population of 45,355, which in 1841 had increased to 62,794, of whom about one-fifth part are engaged in the linen manufacture. The town is represented in parliament by one member.

Dundee contains one handsome *place*, denominated the High Street, in the centre of the town, and several other good streets; but the most elegant and commodious private dwellings take the form of suburban villas. There is a handsome modern building, serving the purposes of an Exchange and reading-room, besides which the most conspicuous public buildings are the Town-House and a building comprehensively called the Seminaries, containing an academy and grammar-school. The High Church of Dundee was an interesting building of the thirteenth century, with a massive tower 156 feet high; but the whole structure, excepting the steeple, was destroyed by fire in January 1841; it has since been rebuilt after an equally elegant and more commodious style. Dundee is now connected by railways with all the principal towns, and through them with England. It also carries on a regular steam intercourse with London.

*Perth*, the chief town of the county of the same name, is celebrated on account of its elegant appearance, and the beautiful situation which it enjoys on the banks of the Tay, here a broad and majestic stream. Umbrella-cloths, gingham, handkerchiefs, and shawls are manufactured in Perth in considerable quantities, the number of weavers employed being 1600; and there are a flax spinning-mill and an extensive bleachfield. The river being navigable to this place for small vessels, there is a harbour, chiefly for coasting trade. In 1845 there were 89 vessels belonging to the place, the tonnage of which amounted to 8825; the gross receipt of customhouse dues was £12,572. The salmon fisheries on the river are a source of considerable income: the fish are sent to London in boxes, the number of which in 1845 was 6000, amounting to 300 tons. Perth had in 1831 a population of 20,016; and in 1841, 19,293. It is represented by one member in parliament.

The streets of Perth are generally rectangular, and well built of stone. The river is spanned by a substantial bridge, connecting the town with a small suburb on the other side, and forming part of the great north road. The town contains most of the public buildings found in places of similar character and magnitude: the ancient Church of St John, an elegant suite of county buildings, an academy, and Town-Hall, are those most entitled to notice within the town. In the envi-

rons, besides a lunatic asylum, there is the General Penitentiary for Scotland, under the improved Prisons Act of 1841. The beauty and salubrity of Perth are much enhanced by two beautiful pieces of adjacent public ground, respectively entitled the North Inch and South Inch. In the midst of a highly cultivated vale, pervaded by a great river, and with lofty mountains in the distance, Perth, especially when its own neat appearance is considered, may be said eminently to deserve its appellation of 'the fair city.' It is now connected by railway with Dundee and the north on the one hand, and with Glasgow, Edinburgh, and the south, on the other.

*Dumfries*, the principal town of Dumfriesshire (71 miles from Edinburgh, and 34 from Carlisle), enjoys a beautiful situation on the Nith, which is navigable to nearly this point for small vessels. The population has varied little since 1821, being in that year 11,052; in 1831, 11,606; and in 1841, 11,069. Dumfries has a few small manufactures, but its chief importance rests in its character as a kind of provincial capital and seat of the county courts, and as an entrepôt for the transmission of cattle and pork to the English market. Eighty-four vessels belong to the port, with an aggregate tonnage of 5783; and steam-vessels sail regularly to Liverpool. The town has a neat and clean appearance, has some handsome public buildings, and is the seat of considerable refinement. In St Michael's Churchyard repose the remains of Burns, over which his admirers have reared a handsome mausoleum.

*Inverness* (155 miles from Edinburgh) is the principal seat of population in the northern counties of Scotland. It is an ancient royal burgh, a seaport for the export and import trade of the district, and the seat of the county courts. The situation on the river Ness, near its junction with the sea, with some picturesque eminences in the neighbourhood, is one of great beauty, and the town itself is well-built and remarkably clean. Inverness is often called the Highland capital, being within the line of the Grampians, and the residence of many persons connected with that district. In 1845 there were 144 vessels belonging to the port under 50 tons, whose tonnage was 3737; and 80 vessels above 50 tons, whose tonnage was 6481. The customhouse dues amounted in the gross to £5082. The population of the town and parish in 1831 was 14,324; in 1841 it was 15,418. Amongst objects of interest may be enumerated—the remains of a fort built by Cromwell; Craig-Phadric, an eminence crowned by a vitrified fort; and the moor of Culloden (distant 5 miles), the scene of the fatal battle which extinguished the hopes of the House of Stuart.

The principal towns in Scotland, next to those above enumerated, are—in Ayrshire, *Kilmarnock*, a prosperous seat of the coarser woollen manufacture—population in 1841, 19,956; *Ayr*, the capital of the county, a thriving market-town, and in a small degree a seaport—population, 8264; in Stirlingshire, *Stirling*, the county town, remarkable chiefly for its castle, a favourite seat of the Scottish monarchs, and from which the most splendid views are commanded—population, 9095; *Falkirk*, a busy market-town, and the centre of a district remarkable for its iron-foundries, particularly the celebrated one of Carron—population, 15,621; in Fifeshire, *Dunfermline*, the principal seat of the manufacture of damasks, diapers, and similar fabrics, and an ancient seat of royalty, celebrated for the remains of its Abbey, which contain the tomb of King Robert the Bruce—population, 20,217; *Cupar*, the county town—population, 6400; *Kirkcaldy*, a busy manufacturing and seaport town—with a population (including suburbs), of 18,000, and a commercial shipping amounting to 10,000 tons burthen; *St Andrews*, the seat of an ancient university; in Forfarshire, *Montrose* and *Arbroath*, active seats of the linen trade, celebrated for their pavement quarries, and likewise seaports—the former having a population of 15,000, and a tonnage of 15,200, the latter a population of 8700, and a tonnage of 6500: in Morayshire, *Elgin*, a royal burgh and county town.

# IRELAND.

This large and important member of the British Isles is washed on the south, west, and north by the waters of the Atlantic, and on the east by a strait—called at different places the North Channel, the Irish Sea, and St. George's Channel—which separates it from the larger island of Great Britain. The width of this strait is variable, being about 47 miles between St. David's Head in Wales and Carnsore Point in Ireland, about 55 between Holyhead and Dublin, and only 13½ between the Mull of Cantire and the opposite point of Fairhead. More compact in form than Great Britain, Ireland is, nevertheless, indented by a number of bays and estuaries, which give it an irregular coast-line of not less than 2200 miles. It lies between lat. 51° 25' and 55° 23' north, and between long. 5° 28' and 10° 35' west. Its greatest length, from Crowhead on the southwest to Fairhead on the north-east, is 306 miles, but on any meridian not more than 235; its greatest breadth, between the extreme points of Mayo and Down, 182 miles; its least, between Galway Bay and Dublin, 110. Its entire area is estimated at 31,874 square miles, or about 20,808,271 statute acres. Of this area, about 13,000,000 acres are under cultivation, such as it is; 6,200,000 uncultivated; 375,000 in plantations; and 631,000 of water. Of the 6,200,000 uncultivated acres, not more than 2,500,000 are unsusceptible of improvement; the rest might be improved either for pasture or for tillage.

### SUPERFICIAL FEATURES.

In superficial character, Ireland may be considered as an undulating or hilly country—less rugged than the Highlands of Scotland, and not so tame as the eastern section of England. Its hills are generally more rounded than abrupt, and lie in detached clusters rather than in chains or ranges. One of the best defined ranges is the *Sliebh Bloom*, occupying a somewhat central position, and running in a southerly direction between King's and Queen's Counties through the north of Tipperary. In this range, the highest point of which is 1690 feet, the rivers Barrow, Nore, and Suir, commonly called the 'Three Sisters,' take their rise. The *Mourne* mountains, a small, but well-defined range,

occupying the southern angle of Down, have a culminating point in *Sliebh Donard*, 2809 feet above the sea. It may be here observed that wherever the Irish term *sliebh* is applied to a mountain, it expresses that that mountain forms part of a range. From Dublin Bay southward through Wicklow, there is an irregular range, whose extreme height is 3039 feet, descending in the lateral branch of the *Croghans* to 2060 feet. In the northern and western parts of the island, several irregular clusters occasion considerable diversity of surface; and in the south, the country is decidedly hilly, the ranges running somewhat parallel, but attaining to no great elevation unless around Killarney, where *Macgillicuddy Reeks* rise in Gurrane Tual to 3405 feet, being the highest point in Ireland.

The flat or level portions of the island, with the exception of some fine tracts of fertile valley-land in Kilkenny, Tipperary, and Limerick, consist mainly of bog or morass, which occupy, according to Dr. Kane, 2,830,000 acres, or about a sixth part of the entire superficies. The largest of these morasses is the Bog of Allen, which stretches in a vast plain across the centre of the island, or over a large portion of Kildare, Carlow, King's and Queen's Counties—having a summit elevation of 280 feet, in which the Boyne and some lesser rivers take their rise. Along the banks of the river Inny—which, rising in Lough Iron, in county Westmeath, crosses Longford, and falls into the Shannon—are large tracts of deep, wet bog, only exceeded in dreariness by that which for miles skirts the Shannon in its course through Longford, Roscommon, and King's County. These bogs consist of turf or peat in various degrees of condensation—from a pulpy or fibrous mass, to a compact mass that admits of being cut into any form. They rest on a substratum of clay and limestone gravel, are from 15 to 40 feet in depth, and are composed chiefly of aquatic vegetables, which have grown on the sites where they are now entombed.

It is worthy of remark, that notwithstanding the quantity of water contained in these extensive bogs, there arises from them no miasma injurious to health. This is attributable to the large portion of tannin they contain, which possesses so strong an antiseptic quality, that bodies plunged into a deep bog remain undecayed, the flesh becoming like that of an Egyptian mummy. It sometimes happens that a bog, overcharged with water during a rainy season, breaks through the obstruction which the drained and more solid part affords, and, rushing forward, overflows large portions of good land. This occurred in the year 1821, when the Bog of Clara, in the county of Westmeath, suddenly burst into the valley of the River Bruana, and totally destroyed many hundred acres of excellent land: a similar occurrence took place, to a large extent, a very few years since in the county of Antrim.

### GEOLOGICAL STRUCTURE.

The rock formations of Ireland commence with the primary schists and slates, and terminate, generally speaking, with the coal-measures. The igneous rocks are granites, greenstones, traps, and columnar basalt, which is displayed in unparalleled symmetry at the Giants' Causeway in Antrim. The primary rocks—namely, mica-slate, quartz, marble, serpentine, clay-slate, &c.—form a broad rugged fringe all around the island, making the interior a sort of basin, in which successively appear the old red sandstone, carboniferous limestone, and superimposed coal-measures. Breaking through the primaries, and occupying a considerable portion of the surface, are the granites and greenstones; trap and tabular greenstone more commonly disrupt the secondary rocks; and the basalt of the Giants'

Causeway is said to be associated with traces of the chalk or upper secondary groups. Ireland presents no well-developed tertiary, but exhibits instead a magnificent display of superficial accumulation in her bogs, and in those curious ridges of limestone-gravel and clay, locally known as *ecars*, which probably originated at a period when the country was partially submerged, from eddies and counter-currents caused by inequalities of the surface. One of the most remarkable geological features of the island is the development of the carboniferous limestone, which forms the surface-rock of nearly two-thirds of the country, thus contributing to the fertility of the soil, and, in conjunction with a moist and temperate climate, conferring upon the vegetation its proverbial verdure. The appellations, 'Emerald Isle' and 'Green Isle of the Ocean,' are names sung by its poets, and repeated with affection by its natives in all quarters of the world.

The available minerals are—granite of excellent quality, as that quarried to the south of Dublin; roofing-slate, as that of Killaloe and Valentia in Kerry; limestone in inexhaustible supplies; excellent marble, as the mottled of Fermanagh, the green of Galway, and the black of Kilkenny; building-stones of various sorts; coal (both anthracite and bituminous), which is worked in Carlow, Kilkenny, Donegal, Limerick, Tyrone, &c.; potters' clay and fullers' earth; and a few of the precious stones. The principal metals are copper and lead, found in Cork, Kerry, Wicklow, &c.; iron in inconsiderable quantities; gold and silver, which were once, and, we believe, are still sought after in Wicklow; a little antimony and manganese. Before concluding this brief survey of the geology of Ireland, it may not be irrelevant to state with Mr M'Culloch, that 'Dublin, Belfast, and the factories in the north, are mostly supplied with coal from England, at about 10s. or 12s. per ton, and that such also is the case in most parts of the country where coal is used. The great mass of the Irish people will probably be for many ages dependent on the neighbouring peat-bogs for fuel.'

#### HYDROGRAPHY, &c.

The *bays* and *loughs* which indent the island are numerous, and of considerable importance to commerce. On the east the following are worthy of notice:—Belfast Lough, a large indentation, about 13 miles in length, and from 6 to 8 wide, of easy access, affords good anchorage, but shoals towards its extremity, so that vessels can only reach Belfast with the flood; Strangford Harbour, about 15 miles in length, and from 5 to 6 in width, with a narrow dangerous entrance; Carlingford Lough, about 11 miles in length, and 2 wide, but obstructed by a shallow bar; Dundalk Bay, a large shallow basin of little navigable value; Dublin Bay, of considerable size, and converted, as it were, into a dock by long piers projecting from both sides of its fair-way, with a view to remove the sandbanks with which it is encumbered; and Wexford Harbour, a spacious inland basin of irregular form, and almost landlocked, but obstructed also by a shallow bar. On the south are Waterford Harbour, or the estuary of the Barrow, Nore, and Suir, curving inland with deep water, and admitting vessels of large tonnage to Waterford, which is 15 miles from the sea; Dungarvon and Youghal Harbours, both of minor importance; the fine harbour of Cork, with its deep narrow entrance, and spacious basin studded with islands, yet capable of accommodating the whole navy of England; and Kinsale Harbour, also a safe and commodious retreat. On the south-west angle are the large bays of Dingle, Kenmare, Bantry, Dunmanus, and Crookhaven, all of easy access, and affording excellent anchorage. On the west coast are Tralee Bay, a somewhat dangerous basin; the large and commodious estuary of the Shannon, fully 70 miles long from its entrance between Louphead and Kerryhead to Limerick, which can be reached by vessels of 300 and 400 tons; Galway Bay, Clew Bay, Blacksod, Killala, and Sligo, all capacious and deep-water inlets; and Donegal Bay, an extensive arm, with several minor

creeks and harbours, none of which are of much importance, with the exception of Killybegs. On the north coast are Lough Swilly, a long, deep, irregular gulf, projecting inland for 25 miles; and Lough Foyle, a large, oval, but somewhat shallow basin, about 15 miles long and 9 wide, with an entrance scarcely a mile across.

The *promontories* of the island are generally bold and well defined; several of them being celebrated sailing marks, and the sites of lighthouses. The more prominent on the east coast are St John's Point, Dunany Point, the Heads of Clogher, Howth, and Wicklow, and the Points of Cahore, Greenore, and Carnsore. On the south are Hook Tower, the headlands of Ardmore and Kinsale, the celebrated Cape Clear, and Mizen Head. On the west are Crow Head, Dunmore Head, Loophead and Kerryhead, guarding the entrance of the Shannon, Slynehead, with its two lighthouses, and the headlands of Achil, Urris, and Tillen. On the north, Bloody Foreland; Malin Head, the most northerly point in the island; Giants' Causeway, with its picturesque pavement, steps, and columns; Bengore Head; and Fairhead, rising 630 feet above the sea, with its irregular courses and columns of tabular basalt.

The *islands* are, generally speaking, small, and of little importance. On the east the largest is Lambay, about 2½ miles off the coast of Dublin, and 'remarkable for its abundance of rabbits, sea-fowl, oysters, crabs, and lobsters.' On the south are Clear Island, with a rough uneven surface of 2000 acres; Tuscar Rock, about 8 miles off Carnsore Point, a dangerous ridge rising 20 feet above the sea, and surmounted by a lighthouse after the model of the Eddystone; the Saltees, another dangerous ledge, also about 8 miles from the inland, and indicated by a floating light. On the west are the Skelligs, a small rocky group, frequented by the gannet; Valentia, a large fertile island of 9600 acres; the Blasquets, the favourite resort of the bird called the gourd; the three isles of Arran, containing an aggregate area of 6823 acres; Innisbofin, Innisturk, and Clare, considerable islands in Clew Bay; Achil or 'Eagle' Island, containing about 23,000 acres, and rising to a height of 1530 feet; the small islets of Inniskea, and the curious irregular *peninsula* called the Mullet. Off the Connaught coast, and extending beyond these islands, are extensive banks, frequented by immense shoals of cod, ling, and other fish. On the north are Aranmore, with an area of 2000 acres; Tory, celebrated for its fertility; and the basaltic island of Rathlin, containing upwards of 3300 acres, and yielding average pasture and crops, and at one time considerable quantities of kelp.

The principal *rivers* are the Foyle and Bann, which flow into the North Channel; the Boyne, Liffey, and Slaney, which empty themselves into the Irish Channel; the Barrow and Nore, which, falling into the Suir, pour their united streams into the bay of Waterford; the Blackwater, running into Youghal Harbour; the Lee, discharging its waters into the harbour of Cork; and the Shannon, with its principal affluents Boyle, Inny, Suck, Brusna, and Maig. None of these rivers are naturally of importance to navigation. The Shannon, however, has been made navigable to Lough Allen by means of locks and lateral cuts; the Barrow by similar means to Athy; the Foyle by canal to Strabane; the Suir is naturally navigable to Clonmel for barges; and several of the others have been artificially united by such lines as the Lagan, Newry, Ulster, Royal, Grand, Athy, and other canals—which now intersect a considerable portion of the island.

There are a number of *mineral springs* in the island, chiefly sulphureous and chalybeate. Those of any note are Mallow in Cork, resembling those of Bristol; Ballynahinch in Down; Swadlinbar in Cavan; Castleconnel, near Limerick; Goldenbridge and Lucan in Dublin.

The *lakes* of Ireland, as might be expected from the superficial character of the country, are both numerous and extensive—covering in the aggregate an area of 455,400 acres. The largest is Lough Neagh in Ulster, its length being about 20 miles, and its breadth from

## IRELAND.

10 to 12 miles—covering an area of 100,000 acres; it is of considerable depth, navigable, and its surface only 48 feet above sea-level. Erne, also in Ulster, consists properly of two sheets, occupying an area of 40,000 acres. Both are studded with inlets, and lay claim to some share of picturesque beauty. Lough Derg, a small sheet in the same province, contains some inlets, in one of which is situated St Patrick's Purgatory—a narrow cave, which has long been a noted place of pilgrimage. In Connaught are the large irregular expanses Conn, Maak, and Corrib, remarkable as being respectively 30, 21, and 16 feet above sea-level. The principal lakes in the course of the Shannon are Allen, Ree, and Derg; the first 160 feet, and the last 98 feet above ordinary sea-level. The lakes of Killarney, like those of Cumberland, are more celebrated for their picturesque beauty than for their extent. They consist of three connected sheets, lying in the bosom of the Kerry mountains; are thickly studded with islands, present outlines the most irregular, and surrounding scenery of the most opposite and diversified character.

### CLIMATE.

The *climate* of Ireland is remarkable for its mildness and humidity—results arising, in the first place, from its being surrounded by the Atlantic, from which no portion of its interior is distant more than 50 miles; and in the second, from the comparatively small elevation which the generality of its land attains. This mildness is proved by the fact, that even in the northern county of Donegal, the arbutus, laurustinus, agapanthus, and fuchsia grow healthily in the open air, and myrtles so luxuriantly as to cover the walls of houses up to the second storey. Its humidity, though great, differs considerably in different districts, the south-west and west receiving, on an average, 42 inches of rain annually; while in Armagh, for example, there falls little more than half that amount.

The prevailing winds are the west and south-west; indeed winds from a westerly direction blow for nearly three-fourths of the year. These, tempered by the warm currents of the Atlantic, and surcharged with its vapours, produce mild, but extremely variable seasons along the south and west; and though snow seldom lies, even on the highest hills, and verdure is everywhere promoted, yet an early wet autumn often obstructs the harvest, and thus renders winter, properly so called, longer than in England. Difference of latitude has its usual effect, though somewhat less perceptible. Thus in the southern counties spring is earlier, fruit ripens a fortnight sooner, and the harvest is fit for the sickle a month before that of the northern, and about a fortnight before that of the midland districts.

### BOTANY AND ZOOLOGY.

The native *Flora* and *Fauna* of Ireland generally resemble those of the neighbouring island; the cultivated plants and domesticated animals are identical. There are, however, some species peculiar to the island, of which the following are the most remarkable:—The strawberry-tree, found at Killarney, particularly beautiful from its abundance of red fruit; the Irish rose, found near Belfast; the Irish furze, found sparingly in Down, distinguished from common furze by its upright mode of growth and softer texture; the Irish or Florencourt yew, of upright growth and dark-green foliage, resembling that of the cypress; the Irish menziesia, whose large purple heath-like bells decorate the wild districts of Galway; the Corsican and other species of heaths, found also in Spain and the islands of the Mediterranean; and cargeen or Irish moss—a sea-weed of some commercial importance.

At present, Ireland is not entitled to the character of a well-wooded country—a defect which is fast being remedied by extensive plantations; but we have historical evidence, as well as the indubitable records of her bogs, that at no very remote period large tracts were covered with a gigantic growth of the ordinary forest-trees. Morrison (1596) and Davis (1605) mention the

forests in which the poor Irish took refuge; and all the scenery of Spenser's 'Faery Queen' is drawn from the River Bandon, which he celebrates as the 'pleasant Bandon, wood y-crowned,' as it is to this day. Boate, in his 'Natural History,' mentions the great extent of wood then standing; but not long did it so stand, for wherever Cromwell's army came, the forests were felled and the country laid bare. There are still, however, in a few favoured spots, some remains of the ancient oak and ash woods, as at Killarney, at Glengarriffe near Bantry, in Connemara, in some spots of the county of Wicklow, and in Donegal, near the beautiful, but little Lough Van, where a few red deer are still to be seen. The plantations in Ireland, in 1841, were thus estimated in acreable extent:—Oak, 29,536 acres; ash, 6042; elm, 1417; beech, 3274; fir, 25,239; mixed, 280,096—making a total of 345,604 acres.

With respect to the animal kingdom, the elk has passed away, leaving its skeleton and antlers in the bogs as memorials of its gigantic size; the wolf has disappeared since the time of the Commonwealth; the wolf-dog is still to be met with, though rarely; the red-deer frequents the wild mountain districts of Kerry; the eagle inhabits the western coast of Connaught; the Irish falcon of our ancestors is, we believe, extinct; the gourdlet claims the Blasquets as his own peculiar residence; and the gillaroo and dorchar trouts are limited to Lough Neagh. Of the domesticated animals, though these are now generally cross-breeds, Ireland possesses some varieties regarded as peculiar—namely, the Irish black horse, the Kerry and old Irish breeds of the ox, a worthless wiry-wooled sheep, and a long-legged narrow-bodied pig (See from Nos. 37 to 40 inclusive). In consequence, it is presumed, of the humidity of the soil and climate, the adder and snake are unknown, as is also the mole; but, contrary to the vulgar notion, frogs and toads are by no means uncommon.

### PEOPLE—POPULATION.

The bulk of the Irish people are a branch of the Celtic race, who were probably the first settlers in the island. The peasantry throughout nearly the whole country are of this origin, and in many parts they still speak the Celtic (here termed the Irish) language. The chief exception from this rule is in the north, where a great number of the humbler, as well as middle-classes, are descended from comparatively recent settlers of Scottish extraction. Another rather conspicuous exception is found in Connaught, particularly in Galway, where a considerable number of the people seem to be of Spanish descent. Families of English extraction are comparatively rare amongst the labouring-class in Ireland; but a large portion of the upper and middle-classes are of Saxon descent, and differ little from the same ranks in Great Britain.

Limiting the consideration of the social state of Ireland to what is peculiar to it, we may first advert to a conspicuous practice of the landowners—*absenteeism*. By absentees are not meant those noblemen who, being Englishmen, have also large possessions in this country, and whose estates (with some glaring exceptions) are usually well and justly managed; but those sons of Erin who prefer living in any other country to remaining in their own, although it is at home only that a man receives his just meed of respect. This system of absenteeism has led to that of *middlemen*, who hold large tracts of land from the head landlord, and relet this land at a much increased rent to farmers; these, again, set to a third set of under-tenants at rack-rents; and this lowest grade of tenantry divide their small farms among their sons; thus creating a race of farming poor, who are unable to till their holdings properly, and miserably increasing a population raised but a step above the pauper. There is perhaps no more thriving person than the *farming-landholder*, who, contented with his condition, rises with his labourers, holds his own plough, and superintends the management of his farm; but the state of the *cottier* is often far from being a happy one. The discomfort of this class may be said

to arise chiefly from three causes—low wages, high rents, and, most of all, from the want of steady employment. The too great subdivision of land, as will be shown in treating of the condition of the peasantry in the provinces, is another cause of the general poverty and want of comfort of the cottier. Under the excitement of war prices and the free trade in corn with Great Britain, agriculture advanced rapidly, and consequently so did the demand for labour; land rose in value, lessees were tempted to realise profit-rents by subletting their farms; and thus the land was let in still smaller divisions and at extreme rents. This system was an absolute bar to the encouragement which might have been given to the tenantry by the proprietors of estates. The occupying landlord pays a higher rent to the middleman than does the middleman to the proprietor, because the middleman exacts as much as he can get, without any reference to the future situation of the tenant: but the landlord has different feelings—he looks forward, and considers the reversionary interest which he has in keeping his tenant in prosperity, and his land in a state to yield a remunerating profit.

The habits of getting credit frequently at an advance of 50 per cent., of resorting to pawnbrokers, and of forming early marriages, contribute to the impoverishment of the labouring-classes in Ireland. The poorer the individuals are, the more eager are they for wedlock; even the very beggars, and their name is legion, intermarry. It must, however, be admitted as some excuse, that early marriage is much encouraged by the Romish priesthood; and in fairness it must be added, that this practice contributes exceedingly to the morality of the lower classes. The superstitious regard to *wakes* and funerals, which has been handed down from ancient times, is often a deplorable drain on the slender resources of the peasant.

In considering the character of the Irish peasantry in general, it is refreshing to see some noble traits standing out in full relief against the darker shades. The Irish people are of acknowledged bravery, proverbial hospitality, affectionate to their parents and aged relatives, and charitable to the mendicant, if that, in the present social state of their country, can be considered a virtue. The women, generally speaking, are modest and irreproachable in their conduct; and it must be added, that notwithstanding the crime and wretchedness which oppress the country, the poor Irish are free from some species of vice which are but too common in other countries. During the hay and corn harvests of England and Scotland, the services of the Irish labourers are very important. They are generally sober, well-conducted, and inoffensive; labouring hard and living hard, that they may bring their earnings home to pay the rent of their little farm or dwelling. A *spalpeen*, or harvest-man, carries home from four to eight or ten pounds; to do which he is contented, while away, almost to starve himself. There is reason, therefore, to hope that, under a better state of things, the national character would rise to a standard much higher than it has yet attained; and improvement may reasonably be expected from the legislative efforts now in course of development.

The last, but by no means most miserable class in Ireland, is that of the common *vagrant*. Of these, some are beggars by profession; some are obliged, from loss of employment, to become what are called *walkers*; and others are mendicants for a time only, as when their husbands are reaping the harvests in England, at which time it is customary to lock up the house, and the wife and children *walk the world* until the traveller returns with his little hoard of hard-earned money. It may be asserted that in every district of Ireland, excepting some peculiarly-circumstanced portions of Ulster, there is a feeling of respect towards mendicancy, which tends to support and perpetuate it. The poor tenants of the cabins receive the wanderers, whether single or in groups; and carrying, as these do, their bedding along with them, a warm corner is allowed them even in the only room possessed. 'It is the

humblest sort,' say they, 'that are really good to us.' The vagrants that frequent fairs, markets, patrons, holy wells, and other places of religious or pleasurable resort, are better off than the other poor. A respectable evidence declared to the commissioners on the Poor-Law Inquiry in the county of Meath, that the beggars at fairs were 'as jolly a set as ever he saw in his life;' and in more places than one, it was stated to the commissioners that the beggars were better off than the tradesmen or labourers.

Hitherto, the usual methods of supporting the pauper poor have been congregational collections, subscriptions, very extensive private charity, and of late years the application of the resources of the Mendicity Association; but the inefficiency of these means has ultimately led to the establishment of a *Poor-Law*, the general object of which is to relieve the destitution of the country. (See No. 62, p. 192.) It appears that so far as the poor-law system is as yet brought into operation, it is imperfect, and has not relieved the districts in which it has been carried into effect from the annoyance of mendicity, inasmuch as there is no compulsory law for retaining vagrants in the poorhouses; they therefore leave them at pleasure, to follow the more agreeable course of begging in the streets. Until such enactment be passed, or begging be declared an offence, Ireland, it would seem, will be subject to a severe taxation in support of the poor-law system, while at the same time it is not relieved of the evils of mendicancy.

The population of Ireland was estimated by an acute statesman of the reign of Charles II. as being then about 1,100,000. Another estimate formed in 1731, but upon data not perfectly to be relied on, made the population 2,010,221. This last number seems to have been doubled before 1788, till which time Ireland was almost exclusively a pastoral country. Since then, agriculture and commerce have borne more conspicuous parts in the national industry; but circumstances unfavourable to national happiness and wealth have also been strongly operative, and the progress of the people was, till a very late date, upon the whole downward. In proportion to the unfavourable circumstances, and most of all where the circumstances have been the most unfavourable, the population has increased. It was at the first regular census in 1821, 6,801,827; at that of 1831, 7,767,401; and at that of 1841, 8,175,124.

#### NATIONAL INDUSTRY—COMMERCE.

The national industry of Ireland, considering her fertile soil, her maritime, mineral, and other resources, is vastly inferior to what, under proper management, it ought to be. Her *agriculture* and *husbandry*, with a few exceptions, are wretched in the extreme; and yet, notwithstanding, large quantities of grain, cattle, pigs, butter, ham, and eggs, are annually exported to the markets of Great Britain. Potatoes, until the almost universal blights of 1846-7-8, have been the principal crop; oats next in order; barley and wheat but sparingly; flax in considerable quantities; turnips, beet, and other green crops are only as yet coming into culture. The same remarks are applicable to her *fisheries*, which are neglected in an unaccountable manner. The surrounding seas swarm with cod, ling, hake, herrings, pilchards, sprats, &c.; and yet the main supply of salt-fish is obtained from Scotland. Eels and salmon frequent most of the rivers, and are caught in considerable quantities, the northern rivers furnishing part of the supply in the English markets.

'Ireland,' says Mr McCulloch, 'is not, and never has been, a *manufacturing* country. Its unsettled, turbulent state, and the general dependence of the population on land, have hitherto formed insuperable obstacles to the formation of great manufacturing establishments in most parts of the country; whilst the want of coal, capital, and skilful workmen, and the great ascendancy of England and Scotland in all departments of manufacture, will, there is reason to think, hinder Ireland from ever attaining eminence in this department.' Linen may be regarded as the staple

## IRELAND.

manufacture, of which Belfast and the surrounding districts of Ulster are the chief seats. The yarn is for the most part spun by machinery, hand-spinning being all but abandoned; but a great proportion of the cloth is still produced by the handloom. The annual value of the linen now exported from Ireland is estimated at £4,000,000. The manufacture of woollen stuffs is limited to a few localities, as Dublin, Montmellick and Abbeyleix in Queen's County, and to Kilkenny—employing in all perhaps not a thousand individuals. The silk trade of Ireland is all but extinct, being restricted to the production of tabinet or poplin; but the cotton trade, carried on chiefly at Belfast, and at Portlaw in Waterford, seems to be on the increase. *Distillation*, at one time so prevalent, was reduced through the exertions of Father Mathew, from 12,296,342 in 1838, to 5,290,650 gallons in 1842; but has since shown some symptoms of increase.

The commerce of Ireland consists chiefly of the Channel trade with Great Britain, which annually employs about 16,800 vessels, with a burthen of 1,673,000 tons. In 1845, Ireland possessed 79 steam-vessels, with a tonnage of 18,069. On the subject of the Channel trade, which has greatly increased since the Union, Mr Porter has the following interesting remarks:—

The value of produce and merchandise that have been the objects of trade between Great Britain and Ireland, in various years since the Union, has been stated in papers laid before Parliament as follows:—

	Imports into Ireland from Great Britain.	Exports from Ireland to Great Britain.
1801, - - -	£3,270,350	£3,537,725
1805, - - -	4,067,717	4,288,167
1809, - - -	5,316,857	4,588,305
1813, - - -	6,746,353	5,410,395
1817, - - -	4,722,766	5,096,613
1821, - - -	5,338,838	7,117,432
1825, - - -	7,048,936	8,531,353

No account of this trade can be given for any year subsequent to 1825, the commercial intercourse between Great Britain and Ireland having at the end of that year been assimilated by law to the coasting traffic carried on between the different ports of England; and, with the exception of the single article of grain (as to which it was considered desirable by the legislature to continue the record), we have now no official register of the quantity or value of goods or produce received from or sent to Ireland. That this traffic has greatly increased in all its branches there can be no doubt; and this increase may partly be attributed to the abolition of the restrictions that existed up to 1825, but probably still more to the employment of steam-vessels upon an extensive scale. To show the extent to which the traffic has been carried by this means, a statement was furnished to a committee of the House of Commons by the manager of a company trading with steam-vessels between Ireland and Liverpool, of the quantity and value of agricultural produce imported into that one port from Ireland in 1831 and 1832. From this statement it appears that the annual value of the trade was about £4,500,000, which was in great part made up of articles that could not have been so profitably brought to England by any previously-existing mode of conveyance—such as live-cattle, horses, sheep, and pigs; the value of which amounted in 1831 to £1,760,000, and in 1832 to £1,430,000. During the same two years the value of Irish agricultural produce brought to the port of Bristol averaged about £1,000,000 sterling. The whole number of cattle, horses, sheep, and pigs, sent from Ireland to the various ports of England and Scotland, in different years from 1801 to 1825, was as follows:—

	1801	1805	1809	1813	1817	1821	1825
Cattle, -	31,543	21,962	17,917	48,973	45,301	26,725	63,519
Horses, -	669	4,114	3,264	3,904	848	2,392	3,130
Sheep, -	2,879	10,938	7,573	7,508	29,460	25,310	72,161
Pigs, -	1,968	6,383	4,712	14,521	24,193	104,501	65,919

The numbers sent to Liverpool and Bristol alone, in 1831 and 1832, were—

	Liverpool.		Bristol.	
	1831	1832	1831	1832
Cattle, - - -	91,911	71,318	6,078	4,077
Horses and Mules, - - -	539	708	159	190
Sheep, - - -	160,487	96,337	11,640	4,446
Pigs, - - -	156,001	149,090	84,107	85,619

The statement above-mentioned of the imports into Liverpool occasioned considerable surprise at the time it was made, from the greatness of its amount; but it would appear that this branch of trade has since gone on increasing in a most extraordinary degree, as will be seen from the following account of the number and value of live animals brought from Ireland to Liverpool in the year 1837:—

84,710 Black Cattle, at 16s. each, - - -	£1,355,390
316 Calves, 45s. .. - - -	711
225,050 Sheep, 40s. .. - - -	450,100
24,069 Lambs, 18s. .. - - -	22,208
695,429 Pigs, 50s. .. - - -	1,488,555
3,414 Horses, 20s. .. - - -	68,280
319 Mules, 8s. .. - - -	2,528
Total value, - - -	£3,367,760

The average value here assigned to the several kinds of animals, is given on the authority of an intelligent gentleman resident at Liverpool, and who is practically acquainted with the trade.

The value in money, of one seemingly unimportant article, eggs, taken in the course of the year to the above two ports from Ireland, amounts to at least £100,000. The progress of this trade affords a curious illustration of the advantage of commercial facilities in stimulating production and equalising prices. Before the establishment of steam-vessels, the market at Cork was most irregularly supplied with eggs from the surrounding district; at certain seasons they were exceedingly abundant and cheap, but these seasons were sure to be followed by periods of scarcity and high prices, and at times it is said to have been difficult to purchase eggs at any price in the market. At the first opening of the improved channel for conveyance to England, the residents at Cork had to complain of the constant high price of this and other articles of farm-produce; but as a more extensive market was now permanently open to them, the farmers gave their attention to the rearing and keeping of poultry, and, at the present time, eggs are procurable at all seasons in the market at Cork; not, it is true, at the extremely low rate at which they could formerly be sometimes bought, but still at much less than the mean average price for the whole year. A similar result has followed the introduction of this great improvement in regard to the supply and cost of various other articles of produce. In the apparently unimportant article feathers, it may be stated, on the respectable authority above quoted, that the yearly importation into England from Ireland reaches the amount of £500,000.

In the absence of all further customhouse records, the following table of the number and tonnage of vessels in which the trading intercourse with Ireland has been carried on during the first thirty-seven years of the present century, will afford a pretty correct view of its amount and progress. If we compare the tonnage employed in 1801 with that of 1836, we shall find that they bear the proportion of 257 to 100, thus showing an increase of not less than 167 per cent. It will further be seen that this increase has been much more rapid during the last ten years in which steam-vessels have been so much brought into use, than it was in the preceding years of the series. Up to 1826, the increase from 1801 was no more than 62 per cent., showing a mean annual increase of  $2\frac{1}{2}$  per cent.; whereas, in the ten years following 1826, the increase has been as much as 95 per cent., or  $9\frac{1}{2}$  per cent. annually:—

GOVERNMENT—ADMINISTRATION.

The government of the country, since the Union in 1801, is identical with that of Great Britain. It is represented in the imperial parliament by 32 members of the House of Lords, and 105 of the House of Commons. The executive government is invested in a Lord-Lieutenant, assisted by a Privy-Council and chief secretary; and the law is administered by a Lord Chancellor, a Master of the Rolls, and twelve judges of the Supreme Courts of Queen's Bench, Common Pleas, and Exchequer. County, peace, and municipal matters are conducted much in the same way as in England, with the exception of an armed national police-force of from 7000 to 8000 men.

For civil and other purposes, the island is divided into 4 provinces—Ulster, Leinster, Munster, and Connaught—which are subdivided into 32 counties, and these again into baronies, hundreds, and other minor sections. Judicially, there are 6 circuits; and ecclesiastically, 2 archbishoprics, 10 bishoprics, and 2532 parishes, consolidated into 1385 benefices. The following table exhibits the counties arranged alphabetically, their area in statute acres, their population according to the last census, and their capital or county towns:—

Counties.	Acres.	Population.	County Towns.
Antrim, - -	761,877	360,875	Carrickfergus.
Armagh, - -	328,076	232,393	Armagh.
Carlow, - -	321,342	86,228	Carlow.
Cavan, - -	477,360	243,158	Cavan.
Clare, - -	897,994	286,394	Ennis.
Cork, - -	1,846,333	854,118	Cork.
Donegal, - -	1,193,443	296,448	Lifford.
Down, - -	612,495	361,446	Downpatrick.
Dublin, - -	226,414	373,778	DUBLIN.

Note.—Etymologists are at variance as to the origin of the word Ireland; some contending that the words *Erin, Irene, &c.* signify sacred; others, that *Eir, Erin, &c.* mean simply west; that is, Ireland or Westland from Britain. Be this as it may, the topographical nomenclature is essentially Celtic, with a considerable admixture of modern English:—*Bally*, town or village; *hill*, church or cell; *ben*, mountain; *sliabh*, mountain side; *crinis* or *crinis*, island; *knock*, hill; *carrick*, rock-fort; *drum*, bare height; *garry*, rough; *allen* or *ain*, white; *ard*, projecting height; *rath*, rising ground; *cash* or *cash*, field.

ANTIQUITIES, &c.

The antiquities of Ireland may be classed under the heads of the *Cromleac*, the *Cairn*, the *Circle*, the *Pillar-Stone*, the *Barrow*, the *Dun*, the *Lis*, the *Rath*, the ancient *Stone-roofed Buildings*, and the lofty and beautifully-built *Round Towers*. The name *Cromleac* is compounded of *Crom*, which signifies Fate or Providence, and *leac*, a stone, literally 'the stone or altar of God;' and to what god they were dedicated sufficiently appears by the name retained by so many of these altars. They vary in size and form, and in most instances consist of three upright supporters, two at the lower, and one at the upper end, upon which the altar-stone was balanced; underneath this, and between the uprights, a hollow is usually found, which is thought to have been for the purpose of facilitating the passage of cattle and children under the sacred fire—a custom which seems to be alluded to in the Scriptures, when the Israelites are reproached with passing their sons and daughters through the fire to Moloch, one of the names given to the sun.

Of the *Cairn* there were two kinds—the burying and the simple cairn, or high place made of stones flattened on the top. These artificial high places were usually situated on an eminence; and here, on festival days, especially the 1st of May and the 1st of November, the fires of Bel were wont to be lighted. At these times all household fires were extinguished, to be rekindled by a brand from the sacred flame—a practice which continued till the time of St Patrick, who succeeded in putting an end to it. Tumuli of this description abound in all parts of the island.

Closely connected with the cairn, are the circles of upright stones, usually called *Druidic Circles*. They frequently surround a cairn, as that of New Grange in the county of Meath, where the stones are placed about one-third of the whole height above the base: frequently they encircle a pillar-stone.

The *Pillar-Stone* is so generally joined with the circle, cairn, cromleac, and sacred grove, that it cannot be passed over in silence. Numerous instances might be pointed out of lofty upright stones in many parts of the kingdom, standing sometimes singly, but most commonly in conjunction with one or more of the above-mentioned relics of Pagan times. Tradition says that formerly the people collected round such stones for worship, which is confirmed by the common expression in Irish 'of going to the stone,' for going to church or chapel. These stones are conceived by many to have given rise to the carved stone cross found in various churchyards, and of which one of the finest specimens is to be seen at Monasterboycue, in the county of Louth.

There are several kinds of tumuli remaining, of which the Irish names declare the original object. The *Liss*

## IRELAND.

or *Lis*, which signifies a fortified house, was an artificial hill, sometimes approaching in shape to an ellipse, with a flat top, and an earthen breastwork or rampart thrown round the little plain on the summit, where was placed the dwelling, usually protected by a strong walled paling, as is now customary among the Circassians. The *Duns* or *Doons* were places of strength, always perched on a rocky, bold situation, and fenced by a broad wall of extremely large stones, which wall forms one of the distinctions between the dun and the *lis*. The *Rath* signifies a village or settlement: these abound in all parts of the island, and are of various sizes, standing sometimes singly, sometimes so as to form a chain of posts; and frequently may be seen a large head rath, where the chieftain lived, and its smaller dependent raths, on which his retainers dwelt.

Amongst the earliest and peculiar antiquities of Ireland, are the low *Stone-roofed Buildings*, with high wedge-shaped roofs: of these a few instances still exist at Kells, Kildare, Ardmore, and Killaloe. The most remarkable relics of the olden times of Ireland are the lofty *Round Towers*, of which, perfect and imperfect, 118 have been enumerated in various parts of the kingdom. They are built with a wonderful uniformity of plan. They are all circular, of small diameter, and great altitude. In most of them the door is at some height from the ground; small loophole windows, at distances in the sides, give light to the spaces where the different floors once were; and generally there were four larger-sized windows round the top, immediately below the roof, which is high and cone-shaped. There are, however, two or three towers in which it does not appear that there ever were any windows round the top. Of the excellence of the masonry, a proof was given some years ago by the tower of Mahera, which, in consequence of having been undermined, was blown down, and lay, at length and entire upon the ground, like a huge gun, without breaking to pieces, so wonderfully hard and binding was the cement with which it had been constructed. Various theories have been offered as to the purpose for which these mysterious buildings were erected; the only clear point seems to be, that they were connected with the religious rites of the early inhabitants, as they are always placed near churches. They vary in height from 35 to 120 feet; the internal diameter from 10 to 16 feet, and the outer circumference from 46 to 56 feet. Their tapering shape forms one of their most marked characteristics.

Ancient weapons and golden ornaments are from time to time dug up in all parts of Ireland, as bronze swords, exactly like those discovered at Carthage and on the field of Marathon. Multitudes, also, of spear-heads of all sizes, made of the same mixed metal, and curiously-shaped bronze rings, have from time to time been discovered, the use of which had long been a desideratum to antiquaries, when a recent event unexpectedly threw light upon the subject, and confirmed the conjecture of Sir William Betham as to their having been current money. A variety of golden articles have been discovered in many parts of the country, such as semi-lunar shaped disks, formed of thin plates of pure gold; torques, or large twisted collars for the neck; armlets, brooches, rings, pieces of gold, bell-shaped, but solid and fastened together, the use of which has not been made out; and some rings of the same shape as those of bronze, which have been proved by Sir William Betham to have been used as money.

*Ecclesiastical Antiquities.*—Under this head rank those buildings which may be considered as the most ancient, after the Pagan remains, and which bear a peculiar character, differing from that of any extant elsewhere. Of these but few are now in existence. The stone-roofed church of St Doulagh's, near Dublin, belongs to the earliest date; its plan and style are equally uncommon. The latter seems to have been a rude approach to the oldest Norman; it is low, and of great strength; the church, divided by a low-browed arch, seems to have had a small choir and a somewhat larger nave. There are also, strangely disposed, at various

heights, small chambers, apparently for the residence of the clergy. A part of the building is used as the parish church; and the old tower has borne the addition of a belfry, so excellent was the mason-work. The beautiful and curious ruin at Cashel, called *Cormack's Chapel*, is Norman in character, and was probably the cathedral of that diocese previous to the English invasion. It is considered to have been built in the tenth century by Cormac, who was both king and archbishop. He died about a. d. 990. It is to be observed that both here and at St Doulagh's are crypts placed over the churches—a peculiarity known in Ireland only; the crypts in all other countries being underneath. In this very marked Irish-Norman style, there exist a few remains at Aghadoe near Killarney, at Clonathen in the county of Wexford, and near Bannow in the same county, in an ancient town, which having been, time out of mind, overwhelmed by the blowing sand from the coast, has only within a few years been discovered, but, protected by the sand, is in a high state of preservation. The peculiar character which marks these buildings, proves them to be examples of the Irish style subsequent to the age of the towers, and previous to that brought in by the British invaders. Ireland cannot boast of any ecclesiastical buildings of great richness or beauty; but there are some of respectable appearance. The two cathedrals of the capital, St Patrick's and Christ-Church, are at least elegant in the interior. The large cathedral of Galway, and that of Limerick, are both handsome buildings, as is the cathedral of Kilkenny. These are all in good order, and in daily use. There are numberless ruins of monasteries, abbeys, knights' preceptories, and churches, of which the chief are—*Kilconnel Abbey* in the county of Galway; *Corcomroe* in Clare, the finest ruin in Ireland; *Holy Cross* in Tipperary; the *Old Cathedral* on the Rock of Cashel; *Dunbrody* and *Tintern Abbeys* in Wexford; *Jerpoint* in Kilkenny; and *Lusk* in the county of Dublin. Kilconnel and Lusk are remarkable for rude bas-reliefs in stone, which bear a degree of resemblance to the Egyptian hieroglyphics. Many of these still retain fragments of their former ornaments of fretted stone-work—Holy Cross in particular.

*Military Antiquities.*—The traveller in Ireland must be struck with the vast number of small castles which stud the whole country. They chiefly bear date about the reign of Elizabeth, by whose orders they were raised, as strongholds to overawe the wild Irish. They are usually high and square, with towers at each corner. Besides these fortalices, there are ruins of very large castles, so customarily attributed to King John, as to show that they were built in the early times. Of these, the extensive ruin at Trim, in the county of Meath, affords a fair example, as being one of the largest, and often formerly the residence of the viceroy or chief governor. Parliaments were held within its walls, and money minted there and sent into circulation. A few of the ancient castles belonging to the old nobility still continue to be inhabited, as *Malahide*, Lord Talbot's de Malahide; and *Howth*, the Earl of Howth's, both in the county of Dublin; *Shanes Castle*, the residence of Earl O'Neil; *Portumna Castle* on the Shannon, that of Lord Clanrickard; and *Kilkenny Castle*, the seat of the Marquis of Ormond.

### LEINSTER.

This is the largest province of Ireland, and contains the twelve counties of *Louth*, *Meath*, *Dublin*, *Wicklow*, *Wexford*, *Carlow*, *Kilkenny*, *Kildare*, *Queen's County*, *King's County*, *Westmeath*, and *Longford*, the whole forming a large tract of country on the east side of the island, and having Dublin at a central point on the coast. The scenery of Leinster is much varied. The county most remarkable for picturesque beauty is that of Wicklow, a short way south of Dublin; the hills, glens, and valleys are here rich in natural wood, and, bounded by an extensive prospect of the ocean, can hardly be exceeded in beauty. The principal points of attraction for tourists are Lough Bray; a woody

ravine called the Dargle; and the Vale of Avoca, which is one continuous piece of sylvan pleasure-ground. Wexford, still farther south, may also, to a considerable extent, be described as a picturesque and fertile county; and though the county of Meath is for the most part flat and tame, except along the banks of the Boyne and Blackwater, it can boast there of some spots of redeeming beauty; as an example of which *Beau Parc*, the beautiful demesne of Gustavus Lambert, Esq., may well be mentioned; and in a large portion of the county, the quantity of wood and the rich hedgerows give an almost English character to the landscape. Westmeath is remarkable for expansive lakes, and for the dry gravelly hills which give variety to its surface. The Queen's County, though a good deal disfigured by bog, yet boasts, at Abbeleix and Dunmore, of a great stretch of magnificent natural oak wood. The remaining part of Leinster cannot be considered interesting or peculiar in its general features. The King's County contains the greatest portion of the flat flow-bog, on the eastern side of the Shannon; towards Roscrea, where the Slieve Bloom mountains terminate, there is some interesting scenery, especially about the ancient castle of Leap.

Leinster may be considered as much superior to the other provinces with respect to agriculture; and some parts of Carlow, Kildare, and Wexford, are cultivated in a manner approaching in skill to that of the agricultural districts of England and Scotland. In stock, implements, rotation of crops, and the industry with which manure is collected and composts manufactured, there is a great and increasing improvement. Farming societies, ploughing-matches, and premiums for new and better breeds of cattle, have greatly tended to this increasing prosperity; and they only who have witnessed what these districts were previous to the Union, can appreciate the amelioration which has since taken place. Near Dublin are some extensive paper manufactories, and in the county of Meath is a large flax-spinning mill. Generally speaking, however, there are but few manufactures in Leinster.
